MOTOR AGE

VOL. VIII. NO. 14 CHICAGO, OCTOBER 5, 1905 $2.00 Per Year

EUROPE FINISHES YEAR'S CALENDAR

GENERAL VIEW OF MOUNT VENTOUX, WHERE HILL CLIMB OCCURRED

Paris, Sept. 23—With the Mount Ventoux hill climb, the Semmering hill climb in Austria and several minor events, the motoring competition in France for this year practically came to a close. The season wound up with the 2 days' meeting, and the French can rest content after a campaign of the greatest brilliance, which included every kind of a competition that tends to develop the weakness in automobile construction and furnish the manufacturers with ideas on how to improve their product. There have been road races galore, hill climbs of every sort and description, and long tours which have attracted international attention. Of course the automobile proper has received the most attention on the part of the promoters, but the others have not been overlooked, the motor boats, tri-cars and motor cycles having all come in for their share.

France can well be satisfied with her record. The Bennett cup race, won by Thery, redounds to the credit of her makers, especially the Richard-Brasier people, while in the classic Ardennes circuit race French colors were again home first in Hemery's Darracq car. The great Pyrennes tour, vying as it did with Germany's Herkomer, was an unqualified success, M. Sorel vindicating the merits of the De Dietrich, sixty-four racers taking part in the long trip. While France was not officially represented in the Harmsworth cup contest for the motor boat championship, she put one over on the English in the cross channel race in which La Rapiere succeeded in gaining the verdict over the English Napier. The three-wheelers have had an opportunity to demonstrate their worth and did so in the Flino cup affair in which they showed their fine points in a dash along the flat and in a strenuous hill climb at the finish.

Motor cycles have had almost as big a show to win public applause as the automobiles. Nearly every meet held in this country this year has had motor cycle events on its card and innumerable records have been made by Cissac, Lamberjack, Demeester and others. It's true France lost the international motor cycle cup over the Dourdan course, when the Austrian, Wondrick, finished first and lifted the cup held by Demeester, but this is about the only black eye France has received on her own soil in this line.

FINE STRETCH OF ROAD ON SIDE OF THE MOUNTAIN

Abroad, French drivers have not done so well, the Florio cup especially being disappointing, for here an unknown—Raggio—cleaned up the cream of Europe, Duray, Hemery, Rougier, and Gabriel of the French team being obliged to take his dust, figuratively speaking. However, France expects to retrieve this disgrace in the Vanderbilt cup race in your country, despite the fact that the early talk makes Italy favorite. Of course, Parisians would feel safer if Thery and Caillois were in the American event, but still they are confident of the ability of Duray, Sisz, Wagner, Heath and Hemery to bring home the trophy; but what we will do with it if we get it is a question that is worrying some of the confident ones. The Bennett cup is already a white elephant on our hands and if we get the Vanderbilt, too, we will be even more nonplussed—and busied.

The Mount Ventoux hill-climb mentioned above did not bring any too much glory to France, for her greatest rival, Italy, slipped in and carried off the premier honors. It was a brilliant affair, though, and the average Frenchman is too good

TAKING A CORNER
COLLOMB IN A MORS

a sportsman to deny proper credit to even his greatest foe. New records were set in nearly every event and Cagno and his Fiat were the stars of the meet. Cagno climbed the 21-kilometer slope in 19 minutes 13 seconds, which beats by 2 minutes the 1904 mark established by Rougier. The latter was in the same competition and on him rested the hope of the French contingent. He did nobly, but a better man was in the climb. Driving a big De Dietrich, Rougier broke his own record, but his time of 19 minutes 45 seconds was excelled by Cagno, driving his all-conquering Fiat.

Cagno showed himself a master hand at the wheel. No one will question his ability when it is considered that he climbed the 21 kilometer slope at the rate of 67,500 kilometers an hour. The ascent is 1,600 meters, so that he went up at the rate of 84 meters a minute, or nearly 1½ meters a second. The Fiat car he drove is a four-cylinder 130-horsepower affair. It has four speeds, the transmission is by chains, the sparker is a Simms-Bosch and the pump is of centrifugal design.

In the runabout class De La Touloubre, in a Darraeq, covered the distance in 25 minutes 39 4-5 seconds, an average of 49.135 kilometers per hour, beating the previous record of 29 minutes 59 seconds, held by Albert.

In the motor cycle class Lamberjack and Demeester triumphed on the Griffon. Lamberjack finished first in 25 minutes 48 1-5 seconds, an average speed of 148.837 kilometers an hour, beating the 1904 Ingilbert record of 32 minutes 20 seconds. Demeester was second in 28 minutes 35 1-5 seconds. Robert's machine skidded at the start, throwing the rider, who pluckily remounted and finished fourth in 39 minutes 33 seconds. He rode a Buchet machine.

There were several minor breakdowns in the big car competition to mar the sport. Vitalis blew out a spark plug and finished on three cylinders. Collomb did the same, while Hemery put on his brakes too abruptly and burnt out his clutch. De La Touloubre's machine nearly overturned early in the contest else he might have made a much better showing in the runabout class, which he, however, won.

Competition for the Hunziker regularity prize was keen. Medals were offered to the touring or racing cars making the best average speed over 1 kilometer, 5 kilometers and in the hill climb. In this competition Collomb, in a Mors, scored 343 points in class for racing cars. In the touring type event Mottard, in a Chantiers de la Buire, scored 266 points; Rob Berliet, 250 points and Fabre, in 205 points. Demeester carried off motor cycles, scoring 253 points o fon. Lamberjack, on a Griffon, w with 246 points, while Robert, on was third with 237 points.

The first day's contest resulte setting of two new marks—one i tor cycle class and the other in th 8,000 francs cars. Ruamps mad kilometers in 27 minutes 9 secon ing the previous mark of 31 minu seconds. He rode a Griffon mo Rivierre, in a Cotterau, made the in 56 minutes 15 seconds, the pre ord being 1 hour 15 minutes 4

The results of the second day follows: For large cars—Cagno, in 19 minutes 30 seconds; Rougie trich, second in 19 minutes 45 se talis, Rochet-Schneider, third i utes 27 1-5 seconds; Collomb, Mo in 22 minutes 59 2-5 seconds;

Automoto, fifth in 28 mi seconds. De La Toulo Darraeq, won the runa in 25 minutes 39 4-5 sec finish in the motor cycle Lamberjack, minutes 48 1 first; Demee fon, 28 minu seconds, sec Magali, 37 seconds, thir Buchet, 39 seconds, Ruamps, G minutes 58 s fifth at the

tion known to the motor world. One fatal accident marred the meet. Marcel Rol, a photographer of motoring events, who has done nearly all of MOTOR AGE's work in this country, was thrown from Collomb's car and killed. He was riding down the slope with the driver of the Mors when the spill occurred, Collomb and his machinist escaping with a few bruises, while Rol's skull was fractured, death resulting instantly.

From Vienna comes the news that for the third consecutive time Braun won the Semmering hill-climb on the 17th instant. In 1903 he scored his first success, driving Clarence Gray Dinsmore's 60-horsepower Mercedes. The following season, driving Mr. Dreher's 80-horsepower Mercedes he won again. This year, in a 100-horsepower Mercedes, he again won in the racing class, accomplishing the climb in 7 minutes 50⅕ seconds, an average speed of better than 75 kilometers an hour up a grade of 10 kilometers, with average rise of 1 to 25. Braun's time last year was 8 minutes 11⅘ seconds. Zeitlinger, in a Peugeot, won in class I in 20 minutes 40⅖ seconds; Arnold, in a Mercedes, won class II in 15 minutes 16 seconds; Hieronymous, in a Spitz, won class III in 13 minutes 23⅗ seconds; Mueller, 40-horsepower Mercedes, won class IV in 13 minutes 33 seconds time.

Cissac has astonished the motor cycle world by covering 90 kilometers, lacking only 105 meters, in 1 hour, while his time for 100 kilometers was 1 hour 6 minutes 46⅘ seconds, which sets a record the experts believe will stand for some time. The test was made in the Parc Des Princes. The Thomas record of the previous day in the Hydra cup contest was beaten by 3 minutes. Thomas made his record on an Aleyon machine fitted with a Buchet motor and Dunlop tires. His time for 100 kilometers was 1 hour 10 minutes 34⅕ seconds. Cissac's test, on account of not having been made according to the Hydra cup rules, won him no prize.

With the close of the season the French motoring public is looking ahead to next year. The complications arising over the refusal of the Automobile Club of France to longer compete for the Bennett cup has upset all calculations. It is expected, however, to turn the mind of the French public from road racing to the more sensible pastime of touring. The success met with in the contest for the Pyrennes cup here in this country and the enthusiasm shown over the Glidden in America, the Herkomer in Germany and the other affairs like them has convinced the powers that be that there is a great future in store for this department of the sport. Preliminary interest in touring started with the sportsman match between Meyan, of France, and Siddeley, of England, in which a draw decision was given. M. Meyan then proposed that next year an international tour be arranged in which all the leading countries could be represented. Since then others have taken up the idea and it really looks as if next year the Automobile Club of France would promote an affair of such magnitude as will make even the most enthusiastic gasp with surprise. The route talked of includes all the principal countries of Europe. As yet, though, the affair is in embryo.

Another contest talked of is a race in which the tire instead of the car will figure. It has been demonstrated in road racing that unlimited speed can be gotten out of the car, but that the tires are unable to stand the strain. A race in which the tire makers would be obliged to furnish the sinews of war would prove interesting.

Hill climbs will undoubtedly continue in popular favor, while contests for motor cycles and tri-cars will be kept on the motoring calendar.

Not the least interesting competition in this country was the tour of commercial and military machines over roads in the vicinity of Paris. The test continued for 2 weeks and the work of the fifty competing vehicles was followed throughout with the keenest interest.

VANDERBILT FIELD IS LINED UP

Trial Drawings Give Germany Right of Way and Jenatzy Is Selected To Start First—Baron de Caters Withdraws and Campbell Is Substituted—Accident to Chevrolet

New York, Oct. 3—There was a babel of voices and a confusion of tongues at the Automobile Club of America last night, where entrants, drivers, backers, tradesmen and race followers gathered for the final naming of the teams and the drawing for starting positions in the second international contest for the Vanderbilt cup. Lancia, fat and jolly; Nazarri, tall and dignified; Sartori, swarthy and morose, and Duray, blond and of the rah-rah college boy type, chatted together volubly in one corner. In another Christie, tall and fair-haired, and Tracy, argumentative and nervous, smiled at the over-confidence of the visitors, who were calmly leaving the Americans out of their calculations. The two barons—de Turckeim, Massenat and Neubauer—discussed the chances with dignified repose. Senor Conill, who won the Havana cup, was on hand to learn all he could and possibly put up an entry or two for next year's Cuban race. All the importers were there, each seeing no other possible winner but his own car. Newspaper men scurried about, hustling for interpreters for their interviews.

Behind closed doors the commission was considering the substitutions made necessary by the cabled withdrawal of Baron de Caters and the smash-up of the 120-horsepower Fiat by Chevrolet. Baron Turckheim was in the conference as general representative of the European clubs under the deed of gift. The result was that S. B. Stevens, as a member of the German club, was permitted to enter the 90-horsepower Mercedes, which he drove at Ormond, with A. L. Campbell, who piloted his Mercedes in last year's race, as its driver. On hearing of the Chevrolet accident Major C. J. S. Miller, with characteristic sportsmanship, had wired Hollander & Tangeman offering his 90-horsepower Fiat of track fame. As the Italian club had delegated the naming of its team to Hollander & Tangeman there was no question of their right to substitute Major Miller's car.

The substitution settled, Chairman Morrell announced that there would be a preliminary drawing for order of drawing, followed by a final drawing. Without much ado it was decided that Baron Turckheim should draw for France, Robert Graves for Germany, E. R. Hollander for Italy and A. L. Riker for America. Graves was lucky. He drew first draw and first position for Germany. France got second draw and second position, America last draw and third position, and Italy third draw and last position. So it was to be Germany, France, America and Italy as the order of the teams.

It was left to each team to determine the order of the starting of its own men. France decided to abide by the order of finish of the French trials—Duray, Wagner, Sisz, Heath, Hemery. The Americans granted Dingley and Tracy the first and second positions they won in the eliminating trials and decided the order of starting of the substitutes, Christie, Lytle, White—by lot. Germany and Italy named their starting orders arbitrarily and naturally chose Jenatzy and Lancia as leaders. All this made Jenatzy, Duray, Dingley and Lancia the pacemaking quartette for the race, and a lively bunch of four they will be for the others to chase.

The race will be started as near to 6 a. m. as possible, though it will probably be ½-hour later before the odds and evens are lined up on opposite sides of the road enacting Wagner's one, two, three; ein, zwei, drei; un, deux, trois, and uno, duo, tre, which will send them away at 1-minute intervals on their 283-mile journey.

There is a story afloat, by the way, that Wag is rehearsing the count for the start at a school of languages. The spectators will have not much over 5 minutes to wait after Sartori gets a move on him before the leader of the first lap will be hailed by Prunty's "car coming!" Will it be Jenatzy, Duray, Dingley or Lancia?

Though the majority of speculators and prophets are inclined to make Lancia the favorite, there are others, who do not forget that Hemery won the Ardennes circuit or that Duray has made decidedly the best average showing in this year's racing abroad. By the way, the score of the prominent Vanderbilt cup candidates this year among the Europeans has been as follows:

	Bennett	French trials	Ardennes	Florio
Duray	6	3	7	2
Lancia	.	.	.	3
Hemery	.	9	1	4
Nazarri	3	.	.	6
Wagner	.	4	4	8
Sisz	.	5	.	.
Heath	.	6	5	.

There has been little practice on the course of late. The Europeans, barring Keene and Jenatzy, have not yet had their cars long enough out of the custom house to get them in readiness for speeding the practice hours. The course was slippery today from last night's rain and White, Keene, Jenatzy and Cedrino contented themselves with cautious going. By the end of the week practice will be in full swing and then there will be actual times on which to base prophecies.

Saturday's steamers brought five Vanderbilt drivers and their cars. Hemery and Wagner, the Darraeq pair on the French team, and John B. Wor will pilot his own Mercedes as a m the German team, came by the New Lorraine bore Sisz, Renault and I Dietrich, of the French team. On also came Baron Adrien de Turcl will represent the sports committ Automobile Club of France at the

All the drivers were eager to route they would have to travel a day found all of them making e the course in touring cars. The enthusiastically coincided with tha cia and Nazarri, of the Italian te pronounced it, of course, far supe Auvergne circuit. They praised it face, easy grades and gentle curv of course, they saw that the ri curves and the two S jogs would negotiated with caution. All ex fore the week closed to have th cars ready for the early mornin spins. They will take up their q the course at once and begin th the route in touring cars.

Hemery and Wagner will be a Head hotel, which has been eng entirety for them and their Duray will be housed at Krug's, place Jenatzy is already stabled and Lancia are already at Porr with Cedrino, Chevrolet and Sart Italian team, having had the e leased for them by Hollander &

A bit of bad luck befell the I during this morning's practice, v 120-horsepower Fiat, which Ch to drive in the race, was put out ning. In driving the car at down the road near the W. K. Jr., estate, Chevrolet encountere ten turn on the road. In maki switch to negotiate it, the c struck a telegraph pole and t completely turned turtle and wrecked. Both Chevrolet and h Henry Schutting, a Swiss, were the car. Chevrolet escaped w bruises. Schutting was not s when the ambulance, which cam cue, reached the Nassau county Minerva, the physicians found ribs had been broken. The p declares, however, that he will and ready to take his seat besi in the big race. It is now prop Chevrolet to Major C. J. S. horsepower Fiat, which he has record-breaking success on the this season.

With the arrival of Baron c comes the interjection of the p pean controversy over the cor these international road racers. is quoted as prophesying that the last race for the Vanderbilt probability of the trophy bein one for reliability competition here received this suggestion incredulity and are taking off the nerve of the foreigner.

Digitized by Google

that France may not care to run the race in France, should she prove a winner, and that, perhaps, Italy and Germany may find their own races all they care to attend to at home, but there is no other expectation than that the cup will be returned to the commission to be raced for again on Long Island next year in the event of a European contest for it being either undesirable or impracticable, should a foreign team win it. Mr. Vanderbilt gave the cup for a perpetual trophy and to encourage American makers. France may think it has gotten all it can from international racing. America has not, though, and modestly believes it is just beginning to learn enough to play the game further with a bit more hope of success. No one fears that another Vanderbilt race will not be run. There are some even with the temerity to think that America has some chance to name next year's course itself.

Of the American cars only the White is now left on the course. Walter White makes a daily round of the route with it in the hours set apart for racing car practice. The two Pope-Toledos were sent to the factory last week for a final overhauling. It is planned to send the Locomobile to Bridgeport today. The Christie has not been reported on the course during the practice hours for some days.

CONTESTANTS STILL COMPLAIN

New York, Oct. 1—Discussion of the action of the racing board in the matter of the selection of the American team has continued with warmth since the promulgation of its choice. Even among those who expressed confidence in the patriotic sincerity of the board and admired the boldness of its play in deciding to take a gambler's chance on one or more of the quintet of undoubted high speed cars surviving and evolving a winner, the way the board went about it is pronounced inexcusably raw and without defense from a technical or diplomatic standpoint. Whatever reason there may have been for dropping the two touring cars on the ground that at their best they had no chance of winning, the opinion is general that the Thomas had won an undisputed right from its show, not only of speed but of endurance, to retain the place on the team it fairly won.

Harry Houpt wrote a vigorous letter of protest, to which Chairman Morrell sent the following reply:

Your communication of the 27th inst., addressed to the racing board of the American Automobile Association, received and has been carefully considered by me. When your entry was received for the William K. Vanderbilt, Jr., cup race of 1905, it was upon the expressed condition that if there were more than five entries from the United States, the racing board of the American Automobile Association should decide which of the entries might compete in the cup race. The eliminating trials held over the course on the 23d day of September, 1905, were held pursuant to that condition, and with the expressed proviso that the commission reserved the right to select the five cars which, in their opinion, would be most likely to win the William K. Vanderbilt, Jr., cup race. While the 1905 course might try the staying qualities of the car, it admits that extreme speed which must be possessed by any car that stands any show whatever of winning. Consequently the first essential demanded by the commission is speed, which, coupled with endurance, could win; but endurance minus speed has no chance whatever. Accepting your statement in regard to the broken battery box, still the commission was not satisfied with the general showing of the car and does not believe that it would stand as good a chance of winning the cup as the other cars selected to compose the American team. I regret sincerely that you should feel that you have been treated with any discourtesy by the commission, but the occasion called for immediate action in order to give the teams selected an opportunity to commence the necessary preparations at once. We had received and carefully considered the written report of your driver, Montague Roberts, and when you asked the commission for a personal hearing, the vote had already been taken and the team selected.

No formal protest was made by the Royal Motor Car Co. V. E. Minich, general manager of the Haynes Apperson Co., did, though.

After going into details concerning the rejection of the Haynes, Mr. Minich goes on to give his reasons why it should have been accepted. He said in part:

I feel that a word or two regarding our car and its ability to creditably represent the American automobile industry would be in place. While it is true that the car which we entered and drove is simply one of our 1906 stock touring cars, it does not by any means follow that it has not sufficient speed to stand a good chance to win the cup. This car has actually done better than 65 miles an hour on the ordinary pikes around our factory, and on suitable roads will do better than 70 miles an hour. The mere fact that we did not make as fast time as two or three other contestants at the eliminating trials does not signify. We have realized all along that it is a matter of great importance to our company to have the opportunity to show the world what a fast and reliable car we are building. I knew that if our driver put the car over the course at anything like its best speed he would be taking unnecessary risks, and my last word to him before starting was to caution him to drive slowly and carefully, timing himself only to finish among the first five. Had we realized that selection would be based upon the extreme speed that could be made in these trials his instructions and the outcome would have been different.

Mr. Minich also told of the mishap caused by an oiler going through the flywheel, necessitating two stops and a loss of 10 minutes.

WERNER WITHDRAWS

New York, Oct. 4—Special telegram—Clarence Gray Dinsmore, who with George Heath arrived yesterday, canceled Werner's entry to the Vanderbilt race on account of his being disappointed in getting his racing Mercedes from the factory in time to ship it. Werner was accordingly left behind.

Secretary Batchelder has telegraphed Henry L. Bowden suggesting that he substitute Flying Dutchman II, with Basle as driver. This is the 90-horsepower Mercedes with which Basle scored the former 10-mile track record at Providence and not the double-engine Mercedes which made the 32⅘-seconds mile world record at Ormond. The latter, being hastily built in America, would not be eligible.

All entrants for the race are now here. The Europeans are getting their cars ready to begin practice later in the week. Keene and Jenatzy, of the German team, are the only foreign candidates practicing with racing cars. The Fiats and Darracqs were clogged with oil from the Florio race and had to be taken apart and cleaned. Heath is equipped with two Panhards and Duray with two De Dietrichs. White makes daily trips over course during practice hours, covering two or three laps each day at an average rate of 32 minutes. Lancia, Hemery and Duray are the betting favorites with those who think they know.

STARTING ORDER IN THE VANDERBILT CUP RACE

Start	Driver	H. P.	Car	Entrant	Team
1	Jenatzy	120	Mercedes	Robert Graves	Germany
2	Duray	130	De Dietrich	M. De Dietrich	France
3	Dingley	50	Pope-Toledo	A. L. Pope	America
4	Lancia	120	Fiat	Hollander & Tangeman	Italy

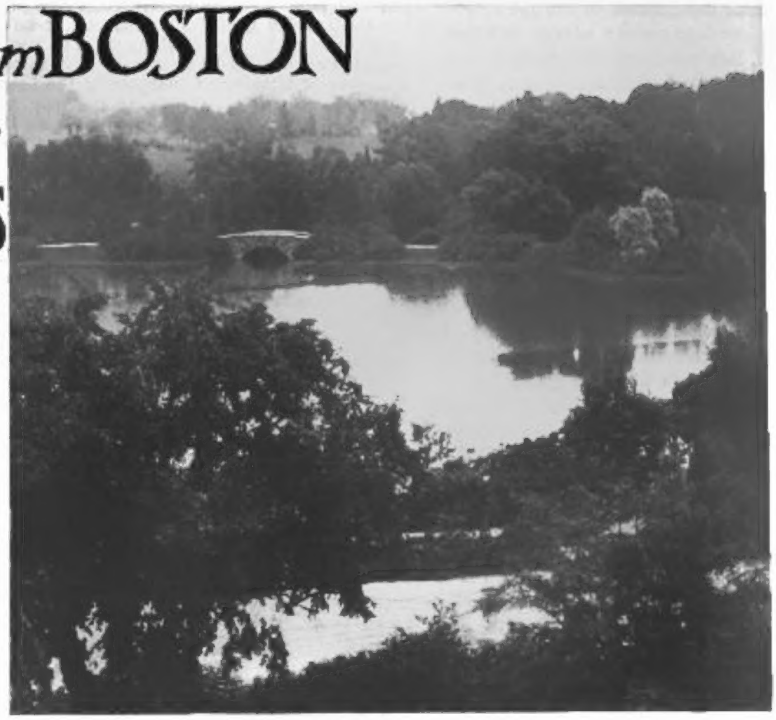
TOURING *from* BOSTON *to the* BERKSHIRES



THE ROAD AT BROOKLINE, MASS., WINDS ALONG PAST OLMSTED POND, CLOSE TO THE

ONE of the Pilgrim fathers, it is related, upon the approach of the vessel to the shores of Massachusetts, cried out, on beholding the beauty of the scenery, "This is paradise." So it may be truly said today that Massachusetts is the automobilist's paradise. In that state the tourist can find on every side patriotic, intellectual and scenic attractions such as are offered by no other state in the union. Massachusetts, an Indian name meaning "the land of big hills," displays at almost every turning tablets and monuments that recall the stories of great men, as well as the importance of great historical events.

Here are depicted the steps that led the colonies to provinces and from provinces to republic. Here may be seen the homes of those intellectual American authors who have placed America in her high position in the literary world. From Boston the hub of eastern motorists, one can in a few hours be in the heart of the Berkshire hills, where at an altitude of 2,500 feet he can bid defiance to the fiery glances of old Sol. Tiring of this altitude, the motorist can also in a few hours be enjoying the latitude—not geographically—of some seaside resort. A natural feature which gives beauty to the scenery of Massachusetts is specially observable in the multiplicity of fresh water lakes, called ponds. These ponds were favorite places with the aborigines who built their little steam baths on their shores.

In a word, in Massachusetts are blended together in all their most beautiful forms mountain, valley, river and seashore. Poets have sung of its rivers. Of one, the Connecticut river, Dr. Dwight has truly said:

"No watery gleams through fairer meadows shine;
Nor drinks the sea a lovelier stream than thine."

But all these inviting features would avail nothing to the motorist were that sine qua non absent—a good system of roads. What state in the union can present such an extent and splendid co of state and other roads as does chusetts? It now has over 600 n well-laid state roads, which are bei tinually extended. These roads spected sufficiently often to disco remove defects in a reasonable tim they appear. These roads are very ent from those that existed at t that E. Everett Hale's friend aske the condition of the roads to a town. The questioned countryman "Wall, naow! Both roads are bad; ever ye take'll be a durned sight the other. I wouldn't advise you t any at all."

Massachusetts, in consequence splendid system of roads, its magn varied scenery, the seaside, city a pleasures it offers, the artistical towns and cities, thirty-six of w within a radius of a few miles f state house, Boston, has become an ly automobile state. There are r 9,000 automobiles registered in t and this is a larger number, in pr to the population, than exists in a state. All over the state the bes modations are at hand for man chine. There are prosperous au clubs—two in Boston, each having bership of over 300, with the rank ing steadily from day to day.

AND THEN INTO FULL VIEW OF LEVERETT POND, NESTLING AMID RURAL BEAUTY

Mr. Dey drove a 40-horsepower Pierce Great Arrow car. Mr. and Mrs. Dey left Buffalo on August 28. Driving from Buffalo to Toronto they passed through some of the best agricultural lands of the dominion. They spent 2 weeks in and about Toronto during the fair. From Toronto they went by boat to Kingston and then drove through Cananoqua, Brockville and Smith's Falls to Ottawa where they spent a week during the Ottawa fair. From Ottawa their route led to L'Original, Carillon, Saint Hermos, Belle Riviere and Saint Scholastique to Montreal, where they spent 5 days taking some side trips in the delightful country of the French Canadians. From Montreal Mr. Dey drove to Vaudreuil, Coteau, Cornwall, Prescott, Brockville and Gananoque, to Kingston whence he went by boat back to Toronto and then home.

THREE WEEKS IN CANADA

Mr. and Mrs. P. L. Gregoire, Miss Grace Sheridan, Miss Katherine Welch and Chauffeur Peter F. Cote, of Lowell, Mass., returned recently from their Canadian trip, which lasted about 3 weeks and covered a distance of between 1,600 and 1,700 miles. The Canadian country was well covered and Montreal, Quebec, Three Rivers, St. Anne de Beaupre and several other places were visited. The party had many novel experiences in their journey through the farming districts, the natives crowding around their machine in open-eyed astonishment. Many of these had not seen an automobile before, to which fact was due their surprise and interest. The party found that automobiles were not in great favor in the northern country and had not attained the popularity that they have in the United States. In Quebec there are only thirty machines, while in Montreal there are not more than fifty. One of the troubles of touring through the farming country was due to the horses that were met with. Not being used to automobiles, the machine was forced to stop often for the purpose of letting the animals pass. While in Canada the party made the ascent of many of the hills and mountains that had never been climbed before by an automobile. The Gregoire cars, a Marion touring car, stood the test without a mishap of any serious kind. On the return trip a puncture was sustained on a road where macadam was being laid, but other than that the trip was devoid of accident. The beautiful Canadian country was thoroughly enjoyed by the party, especially the farmlands that are so prevalent in the north. Gasoline was bought for 50 cents a gallon in some of the towns, and it was considered a favor to get it at that or any price.

NOW ON LONG TOUR

One of the longest trips overland ever attempted by any motorist of the south, is a month's tour of the east which has been begun by John T. Landis, of Nashville, Tenn., president of the Landis Banking Co., ex-president of the Southern Automobile Co., and one of the most prominent stock brokers of the south, in his White steamer. Mr. Landis went to Cleveland via Louisville and Cincinnati and from Cincinnati to Buffalo, across the Berkshire hills over to Boston, and will reach New York city after a tour of that state in time to witness the Vanderbilt cup race on October 14. Mr. Landis is accompanied by B. F. Bell, formerly manager of the Southern Automobile Co.'s garage. At Cleveland, Mr. Landis secured the delivery of his 1906 White steamer and the remainder of the distance is being done in the new car. He expects to reach Nashville on the return trip the latter part of October, the latter part of the trip being through eastern states.

ANALYZES THE FOREIGN TRADE

French Writer Warns His Countrymen that Their Market in England Is Menaced—Britons Refuse to Buy Second-Hand Cars from Across Channel—Balk at Big Prices

London, Sept. 22—J. B. King, the secretary of the British Empire Motor Trades Alliance, an association of British manufacturers, whose object it is to further the interests of the British automobile trade in opposition to that of any other country, has issued to the press this week an article which is certain to obtain very widespread notice and comment. It is a literal translation of an initiatory epistle addressed to the French motor car trade by Georges Prade, one of the best known writers on the French automobile press, whose contributions have done much to make l'Auto the leading French organ of the sport. It is a somewhat remarkable thing that all the facts and figures which Prade uses to enforce his arguments and warnings, have been culled from the pages of the British motor press, yet until he marshaled them, labeled them and summarized their significance, only a few acute observers on this side had read their lesson aright. This is that Great Britain is the largest and wealthiest market open to the world's automobile trade, and that it transcends in importance to the French manufacturer even that of his own country. These facts had been stated by one or two observent trade writers even before the relative statistics appeared, upon which Prade has built his case. But his article has turned surmise into certainty. How much more important and popular automobilism is in Great Britain than in France is shown by the facts which Prade parades for the benefit of his self-satisfied countrymen, to the majority of whom the article has come as a disagreeable surprise. The number of motor cars registered for taxation in France is put at over 17,000; the number of cars similarly registered in Great Britain is over 32,000. For the 7 months of 1905, ending with July 31, Great Britain imported 3,857 motor cars of the value of $8,184,000, or equal to 6,642 cars for the 12 months, of the value of $13,996,800, or an amount greater than France will have expended on its own motor market over the same period—from January to August.

That is the portion of Prade's argument as it directly affects the French motor car manufacturer, whom he implores to study to the utmost the requirements of their English customers. But more startling still is his estimate of the manner in which Great Britain has tackled the task of supplying its own demands in the motor line. He estimates from the official British registration figures that, after deducting those representing the imported motor cars, British motor car manufacturers sold on the British market in 7 months 9,800 cars, or equal, in his view, to 18,000 for the year 1905. Prade, having proved to his satisfaction that the average value of the cars imported into Great Britain is $2,098.96, assumes that this is about the average value of the British-built car, and so finds that Great Britain will have spent $38,102,000 in 1905 on its home productions, which, added to $13,996,800 worth of imported cars, produces $52,159,200 as the trading value of the British motor car market for the current year. He contrasts these figures with the value of the American market to France, greatly to the disadvantage of America, which seems to have been, in his mind, unduly attracting the French manufacturer as a field for his activity. He endeavors to warn his countrymen of the danger to themselves which the rapid development of the British-made motor car trade constitutes, and seems to imagine that by increased attention to this market, rather than by opening up in America, the French motor manufacturer will be serving his interests best by hindering British expansion. Altogether he has produced an article which has caused little less than consternation in French circles, and has evoked the greatest surprise in Great Britain.

Taken broadly, his arguments and deductions are sound; taken analytically his figures and statements require reconstruction. There are not 32,000 motor cars in use in Great Britain; Great Britain will not have imported $13,996,800 of new motor cars, nor will our native manufacturers have sold $38,402,400 worth to their countrymen this year. These statements can be made with confidence. Prade, in estimating the value of our imports, has lost sight of the fact that every car which comes to these shores figures in in the returns which he quotes, but those returns do not state how many of them are British cars whose owners have been touring in them abroad or foreign visitors touring in this country, nor do they state how many of them imported into the kingdom for sale are second-hand machines.

Quite a large second-hand trade has been done between France and Great Britain up to quite recently. For some time France simply emptied its second-hand cars into London. But that trade is easing off, for the British automobilist is now discarding old or unsatisfactory cars in quantities sufficient to absorb the demand that has had to be supplied from France. This change is bound to be felt in France, if it has not already been. It was because a free, if not a good, market existed for their discarded cars that induced, or enabled, French motorists to purchase the f: design produced year by year by t own designers. At the same time loaded up our market with their discar stuff against our British manufactur who had to compete against it. The sence of that outlet cannot fail to con the French market to some extent, with the British market shrinking by son of the advance of the native Br manufacturer, the French trade is f: with the probability of a crisis. Its rival is merely a matter of time, its ex only limited by the progress of rival tions. Prade has simply deciphered handwriting on the wall. France ca continue to exercise the same influenc hold the same position in the motor w if its productive power is suddenly t reduced by one-half. Prade evid thinks that his countrymen are unwi pay so much attention to the Amer market, but he probably overlooks the that in doing that they are endeavorin find a way out of the situation which be created when the British trade out its French rivals in their present est market. You in America are b judges than we can be how far that on the part of the French trade ca successful; but even we can see that such success obtained must only be porary. It really looks as though automobile sun of France had begun t and that when it goes down it will be veritable Austerlitz of trade.

It has been freely stated that only or five French motor car manufact have been making profits this year the names given are Renault Brothers, hard & Levassor, De Dion-Bouton, ron, Girardot & Voigt, Gladiator and sibly Richard-Brasier. In this ca the number is equally small. A Daimler, Wolseley, Humber, Napier Thornycroft alone have any figures considering; the majority of other simply struggling to obtain a footi the market. What profits have been in these cases mostly have gone t retailer. The whole situation is one inated by scarcity of hard cash—perh blessing in disguise, for were capi the command of these struggling co the expansion of trade resulting probably be entirely inadequate to the outlay and disappointment an would ensue to the unlucky investors.

The explanation of the discrepan tween the 32,000 motor cars register the number in use—probably less th 000—is that when a second-hand car from one purchaser to another it is ally freshly registered, no trouble taken to annul the old number, lapses on December 31. That th produced and sold out of British fa this season will amount in value t 102,400 is computed on an average ation of $2,098.96. That is much to The foreign cars imported or broug

Digitized by Google

this country are considerably higher powered and higher-priced than the majority of the native cars selling. An average of $1,601 would be much nearer the mark, for you can get a very serviceable British-built four-cylinder touring car chassis 10-12 horsepower to carry four on the London market for $1,458, and that is likely to be the popular standard and price in 1906.

The market here, as well as in France, is gradually altering. The demand for cars of from $3,645 to $4,860 is fairly satisfied and only renewals are to be expected, consequently firms that have been competing for this market must of necessity produce something lower-priced if their works are to be fully employed or if they want to progress or prevent younger competitors from overshadowing them.

AGAINST FURTHER CONTESTS

New York, Oct. 4—Special telegram—At a meeting of the executive committee of the National Association of Automobile Manufacturers held today the following resolution was adopted by an unanimous vote:

Resolved, That this association is opposed to the holding of any further contests before the end of the present year, and that the contest committee be requested to consider what contests, if any, would be advisable during 1906.

The contest committee, consisting originally of Messrs. Waldon, Clifton and Davis, was increased to a membership of five by the addition of Messrs. Kittridge and Pope. It was stated at the meeting that the appeal in the licensed test, case commenced some time ago in New Jersey, will likely be heard within the next 5 or 6 days. Professor Lucke and Mr. Cashman, representing the New York School of Automobile Engineers, appeared before the committee and explained at length the details of the enterprise. The committee decided to return to the exhibitors at the Chicago show, who have exhibited at previous shows in proportion to the amount of space rental paid by them, half of the net proceeds of the exhibition.

IOWANS HAVE PARADE.

Cedar Rapids, Ia., Oct. 3—This is automobile day at the carnival. Sixty cars of all makes and models journeyed to the rendezvous to take part in a gala parade. With the visitors and the Cedar Rapids owners considerably over 100 machines were in line. After making a tour of the principal streets and avenues the parade concluded at Athletic park, where the annual carnival was in session. Several of the visitors who came to take part in the parade suffered torn and mutilated tires from barbed wire and other obstructions placed in the highway, presumably by the farmers. The Iowa towns which had from fourteen to one representatives in line were: Waterloo, Iowa City, Cascade, La Porte City, Newton, Des Moines, Walker, Belle Plaine, Maquoketa, Washington, Cedar Falls, Reinbeck, Nashua, Clarksville, Delmar, Onsis, Worthington, Vinton, Clinton, Sumner, Traer, Britt, Dysart and North English.

SNEERS AT CUP STORY

France Makes Light of Rumor That Bennett Trophy Will Be Put Up for Touring Contest

Paris, Sept. 23—James Gordon Bennett's recent visit to Italy, when he attended the Brescia meeting, has started the rumor along the boulevards that the donor of the international cup, which has now been raced for six times and which is now in possession of the Automobile Club of France, has decided to take it back and offer it to the Automobile Club of Milan, to be contested for in a big touring competition next year in connection with the universal exposition at Milan at the inauguration of the Simplon tunnel. According to the gosisps, Mr. Bennett conferred with the officials of the Milan club, who, encouraged by the success of their tour last year, were planning another for next summer, with $10,000 in prizes hung up. The result of this confab is said to have been the proffer of the Bennett cup for the tour, which induced the Milanese to raise the prize money from $10,000 to $30,000, in addition to the cup.

In a measure this announcement was a bombshell to the French, but after mature deliberation the wise ones made light of the rumor, pointing out that in the first place the cup is not Mr. Bennett's to give. It has been won by France and at the present time is in the custody of the Automobile Club of France, which, while refusing to contest for it longer, has not as yet handed it back to its donor. It would be unlikely, it is figured, that Mr. Bennett would so far forget his sportsmanship as to promise the trophy for a touring competition without at least consulting the present trustees.

The first rumor of the proposed action came from Milan direct instead of emanating from the officials of the Automobile Club of France, which would be most likely under the circumstances. This in itself is enough to cast suspicion upon the authenticity of the tale. The Automobile Club of Milan has been knocking road racing and boosting its tour and it is presumed here that this story about the Bennett cup was concocted to knock another prop out from under racing.

France having refused to compete again for the Bennett cup as a racing trophy and Great Britain's echoing these sentiments, does not necessarily mean that these two great nations would consent to the altering of the cup conditions, for France has the vote that counts and until Mr. Bennett gets the consent of the club the critics here do not see how it is possible for Italy to cut in and get the cup for a tour prize. Italy's right to hold the 1906 race for the Bennett cup in view of the fact that she finished such a good second, is not questioned. It is the tour story that makes it seem unlikely.

Bearing out the above belief comes a characteristic interview with James Gordon Bennett himself, who returned to Paris last night, in which he denied that he has decided to alter the terms of competition.

"I no longer own the cup," said Mr. Bennett, "and it belongs to the Automobile Club of France, to which it was given to encourage the manufacture of automobiles. Its disposition will be left to the international conference, which will meet in Paris in December. I may say that I am not opposed to the giving of the cup to a great international endurance test."

TRADE HIRES METALLURGIST

New York, Oct. 3—Announcement was made yesterday that a group of the biggest American makers here have entered into an arrangement with one of the biggest concerns in the steel industry, to carry forward scientific experiments, until it has been ascertained, positively, just what grades and compositions of metal are best for the production of a perfectly safe and reliable car. Under the new arrangement a man accounted the cleverist metallurgist in the country and employed by the steel interests, will work together with a metallurgist employed by the makers to ascertain just what grades of material are best for each feature of construction. The concerted action was taken by the group of manufacturers who are members of the Association of Licensed Automobile Manufacturers. Henry Souther will be the metallurgist representing the automobile makers and he will work with the steel interests to solve, not only the question of the best grades of steel for engine and body parts, but also the best compositions of metal for bearings and all other purposes.

PLAN CONSOLIDATION

Hartford, Conn., Oct. 2—A proposition is soon to be brought forward for the amalgamation of the Automobile Club of Hartford and the Hartford Yacht Club. The automobile club is to have temporary quarters for the winter and the yacht club is soon to build a swell new club house in Hartford. The club now has a house in Hartford which is to be rebuilt, while elaborate stations with quarters and dining service are supplied at Fenwick, New London, Crescent Beach and Fishers Island. The yacht club is 11 years old and is the fifth largest in America in point of members and size and pretentiousness of fleet. Each club will retain its original name.

JUDGMENT AGAINST BOYD

Washington, D. C., Oct. 3—Special telegram—The government today obtained judgment for $9,000 against James W. Boyd, president of the Columbia Automobile Co. Judgment was also entered in favor of the government against certain automobiles and other personal property belonging to Boyd. The property will be sold at auction to satisfy judgments.

IS ROAD RACING DOOMED?

WITH the running of the Vanderbilt cup race a week from Saturday the last of the big automobile road competitions of the year 1905 will have been completed and the case of Racing vs. Touring will go before the Court of Public Opinion for a final verdict. The evidence produced during the summer months has been favorable to the touring side of the case and those who profess to be able to read the handwriting on the wall declare they can see thereon the doom of racing, claiming it has served its purpose and the manufacturer no longer needs such competition to show him the faults in his car. He has passed the rudimentary stages of such education and looks to the higher grades for information on the public's need. He gets this from the big tours and so far they have proved of great value. It took little to kill track racing, for it was a hybrid anyway, catering more to the pockets of the promoters than to the education of the maker. Beach racing still exists, as it undoubtedly has a right to, being practically harmless from the danger point of view, furnishing some ideas of value to designers working with a view to developing speed, and furnishing harmless excitement to the great American public, which craves things whose very fabric is sensationalism.

It cannot be said road racing has not had a fair trial, for witness the big events of the past season—the Bennett, the Ardennes, the Florio and, lastly, the Vanderbilt. There is a certain satisfaction in being able to record that these great contests have been successfully run without accidents to competitors or spectators such as would furnish food for the motorphobia press, which would relish such a morsel.

These races have demonstrated nothing except that it is possible to build cars that can maintain unlimited speed—speed such as no law-abiding citizen would wish to use. In this respect the car has outstripped the tire, for it is here the weak spot exists. Now that this has been demonstrated, is it not time that the car be left alone and that future experiments along the racing lines be conducted for the main purpose of improving tire endurance and reliability?

Summing it all up, one cannot help but believe that there must be some fire behind the smoke that arises with the rumors regarding the future disposition of the Bennett and Vanderbilt cups. That the maker would be better served if James Gordon Bennett turns his international trophy over to the Automobile Club of Milan for a touring contest instead of a race and that more good could be derived from the trophy of William K. Vanderbilt, Jr., if he changed the deed of gift so that his cup could be used for a similar purpose, is certain.

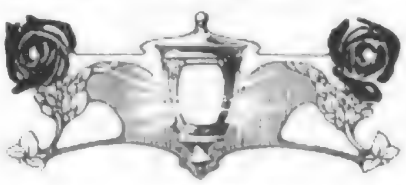
Let any sane motorist weigh the evidence at hand and decide for himself if he would not be better served with each of the great nations promoting tours instead of races—tours in which everyone has a chance, the man who motors for pleasure and the one who does it for hire.

FRANCE IS WORRIED

BOTH England and the continent of Europe are at present stirred up over the facts and figures of a French writer, who shows that beyond doubt England is the market par excellence for the French makers if they will but cater to English needs, conditions and demands.

Mr. Prade, the writer, figures that Great Britain has not to exceed 32,000 automobiles in use and that France is somewhat behind this, with but 17,000. What Mr. Prade says will interest the makers of his own country, who are doubtless seeking some outlet for their products. They have had a small amount of trade with the United States, but it is an insignificant one, inasmuch as the prices which are asked for imported machines do not appeal to the average American when he knows how much more he can purchase at home with the amount of money that would be required for the purchase of a French or German automobile of any size or make.

The figures given to show the number of machines in use in Great Britain and France together fall short of those which represent the number of American machines on the roads. Only ten eastern states, including New York, have a representation of over 10,000 for licenses granted to operate



automobiles during the first half of th present year. Chicago alone is represente by over 3,000, and such cities as Clevelan Pittsburg, Philadelphia, Detroit, St. Loui Minneapolis, St. Paul and the Pacific coa cities are veritable hotbeds of automobil and automobilists. The people of the cou try have, in short, entered and possess the land of motordom.

Last year alone it was conservatively e timated that American makers produc something like 35,000 automobiles, and it safe to assert that very few of these we exported. The past 3 years have seen t automobile trade in America grow alm out of bounds, so that today there must close to 100,000 machines in use in the d ferent parts of this country.

Each year the American market is cl ing to the foreign maker, partially becau the average American does not wish a cannot afford to pay the high prices th are demanded for the imported machi The American would prefer to take three four American cars, strung out over as ma years, than to have one French car of value equal to the three or four Ameri productions.

It is pretty safe to assert that while French maker is looking about for a m ket for his surplus, and is casting his on English soil, the American maker keep on improving his product and at same time will be selling machines r under the nose of the French maker. T time is not so far off, either, for alre the American exports of automobiles are stantly on the increase and a week sel passes that the American car is not he from in Europe's automobile trade in s form or manner.

MOTOR AGE'S CHANGE

THE CHANGE in the size of M AGE, with this issue, has been r for a number of reasons, any of which is sufficient excuse for the lisher to offer. The chief reason is owing to the former size, advertisers compelled to make cuts of a special for MOTOR AGE, not only causing exp but delay as well to both the advertiser to MOTOR AGE. The new form will pe the use of cuts such as are made for automobile publications and will thus a saving to the advertiser. The new being the same as other automobile pul tions, will also permit of MOTOR AGE filed with greater ease.

The general style of MOTOR AGE wil be altered. That is sufficiently satisfa to meet all present demands, both as t the reader and the advertiser may be cerned. But this must not be taken indication that MOTOR AGE is to stand It will continue to be what it has bee best publication of its class, giving reader more and better reading matter week to week, and thereby giving the a tiser more by its constantly increasin culation, evidenced by the publicati its postoffice receipts from week to

Jump Sparks

Evidently Chevrolet was training to touch only the high spots in the big event.

Mr. Morrell and the baseball umpires seem to be having a hard time of it just now.

The excellent weather the country has enjoyed of late has been good for motoring and the Standard Oil Co.

One can imagine what the eliminated drivers will say if the cars which replaced their own on the American team should fall down in point of speed or construction.

Now even the best of the English people have begun to balk on paying fancy prices for cars and have even hinted that they are through with some of the French creations unless prices drop a few shillings.

Motor car accidents are numerous, it is true; but they are quite as freakish as numerous. M. Rol, the MOTOR AGE photographer in Paris, was killed a short time since, and the peculiar part of it is that, being thrown from a car, he was thrust against the only post within 150 meters of the spot where the machine came to grief. If this isn't a case of ill luck then no matter.

The farmer is not an advocate of good roads. Not that he doesn't want them, but because heretofore he has had to bear pretty much all the burden himself for the use of others, as he at least thinks. When the farmer has become an automobilist himself he will warm up to the necessity of decent highways and will be an advocate of state aid. The motoring organizations and the makers could accomplish more for good roads by interesting farmers in the purchase of automobiles than in any other manner.

An old Illinois resident saw a farmer twist his starting crank once, hop in his car and hike off for the farm at 15-mile speed. Naturally it set him thinking. He remembered how he used to ride on hay racks and had to drive 50 or 60 miles with an ox team to procure provisions. He was, after all, far seeing, for he remarked: "Twenty years hence the farmers all over the country will spin into town in their own automobiles. The oxen and the horses will be in the pasture, the hayrack will be in the barnyard, and the family to and from church will go thundering over the macadam roads in an automobile." Wise man! Good prophet!

Last Sunday in Chicago a woman was knocked down by an automobile. She was *not* killed but was reported as severely injured. To this the Chicago Tribune devoted a full column of space with display head on its first page. The same day a trolley car ran down and *killed* an 8-year-old child and the motorman was nearly mobbed. To this the Tribune devoted sixteen lines of reading matter and a five-line heading and tucked the story away on an inside page. What would this mean to a man up the tree?

The Week

Official drawings for precedence in Vanderbilt race gives Germany right of way, Jenatzy being selected to start first; Chevrolet's big Fiat smashed on turn on course and Major Miller's car substituted; Campbell takes Baron de Cater's place.

Analysis of foreign trade by Frenchman shows Englishmen balk at buying second-hand French cars and that prices asked for big cars abroad are thought to be too high.

Cagno proves to be star of Mount Ventoux hill-climb, Italy scoring over her French rivals. Meet marks end of French season.

Percy Megargel has exciting times crossing Bitter creek and Red desert country on his way to coast.

Pittsburg dealers report business for year of almost $1,300,000; demand is for heavy cars.

James Gordon Bennett denies story he has given his cup to Italy for touring competition.

Braun scores his third consecutive victory in Semmering hill climb in Austria.

Cissac smashes motor cycle records in Paris, doing 90 kilometers in hour.

Manager Miles issues official diagrams and rules for Chicago automobile show.

A story from Oelwein, Ia., aptly tells the usual case of fright. The story is from G. H. Phillips and is as follows: "E. H. Burlingham, a prominent and enthusiastic motorist of this city, had a novel experience on the highway north of here during the latter part of this week. While driving his touring car to Decorah he met a horse and buggy containing an elderly lady and gentleman, who subsequently proved to be Mr. and Mrs. Philip Dowse. As Mr. Burlingham approached the rig he stopped and kindly offered to assist the old gentleman in his effort to pass the automobile, to which Mr. Dowse replied: 'If you will please lead my wife by, I think the old mare and I can make it all right.'"

Jenatzy starting first in the Vanderbilt alters the dope some.

When an agent shifts his account, does he have a patent conscience-shifting apparatus also?

Somehow or other Megargel has not come to the front with any hair-raising Injun stories on his transcontinental trip.

It is no wonder that James Gordon Bennett thinks it about time some organization that will guarantee to take care of it and defend it after winning the trophy should have his cup.

Some of the makers and drivers who competed in the American eliminating trial for the Vanderbilt cup race probably feel that they were handed a gold brick when they reached New York. But this is nothing; many a good man has picked up a gold brick in New York.

The decision of the Vanderbilt cup commission to throw out three of the qualifying cars stirred up a hornets' nest for a time, but it is a noticeable fact that the public and the contestants took their medicine gamely. But it must be remembered that silence is sometimes the forerunner of something doing.

Either the Pope people have not withdrawn their racing men or Johnny Fisher has been piping, for his thrilling tales of race car adventure told to the Capital, of Topeka, Kan., are numerous. So far as known his "driving down stretches at the terrific speed of 90 miles an hour," his "climbing outer fences," his making "junk out of more than $10,000 worth of automobiles," and his "turning over 90-horsepower cars" are creations either of his own or some reporter's smoke dreams.

Indications are that the speed fiend is being tamed or that his senses are being restored. The constable and the policeman seem to be resting on their oars, the lumps have been shaved, the snares are forgotten, the farmer is being reconciled and is buying automobiles, the legislative bodies have calmed down a little and the motorist—the sane motorist—is having peace. As MOTOR AGE said some time ago, all that was needed was for the public and the motorist to be reasonable and sane and the motor car would not prove the terrible thing it had been imagined. There is, however, a chance to improve things even now on the part of the enthusiast.

IN BATTLE WITH SAND

Megargel Fights Way Through Frightful Wastes of Western Deserts on Coast Trip

Rock Springs, Wyo., Oct. 4—The Reo Mountaineer still carries on its dash the motto Westward Ho. The mud of the center and the sands of the western deserts will soon be matters of history, in the first half of the double transcontinental tour, and the Pacific will be welcomed.

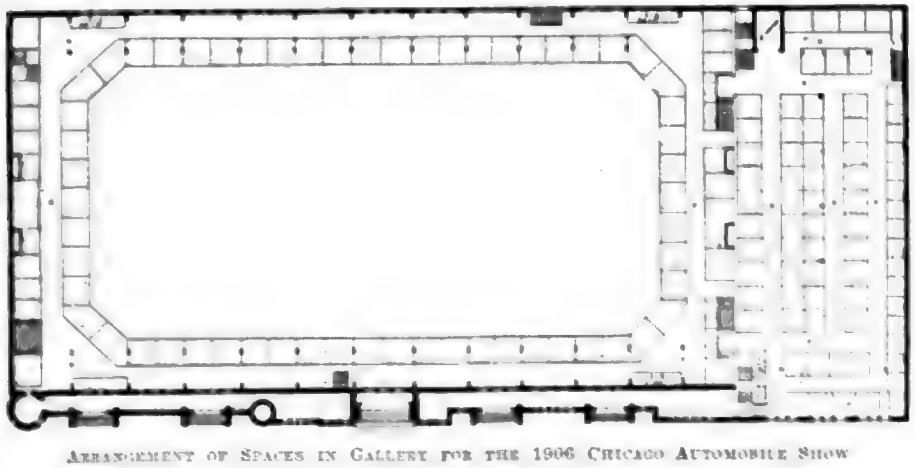
In the old days of transcontinental wagoning a man who successfully navigated the Bitter creek and Red desert sections of the Wyoming trail was considered tough enough for anything. Judging from our own experiences during the past week, the same may readily be applied to the man who operates an automobile over the same tracks. The country is sandy in the extreme and there are no towns from Rawlins to Rock Springs. The only places where a traveler can stop and get water or eatables are the little red section houses of the Union Pacific Railroad company, scattered about 10 miles apart over this entire stretch of waste lands—for the lands are certainly wasted in this section, being too poor for either cattle or sheep.

Tourists must carry what gasoline they deem necessary to cover this stretch of desert and should also provide their machines with sand tires, if they hope to negotiate successfully the many miles of deep white and red sand. Bitter creek receives its name from the fact that the water in this green and white becrusted stream is bitter—so bitter that men and cattle would rather die than attempt to drink it. Judging from the numerous bones, whitening in the sun's fierce rays, both man and beast have perished along this stretch in almost countless numbers.

We carried on the Reo Mountaineer, in addition to well-filled tanks of water and gasoline, 10 gallons of gasoline and 5 of water, strapped on the running boards for use in case of emergency. It was lucky we did, for the emergency came when we struck the sand. After putting on our sand tires, the Mountaineer ran on low speed with throttle wide open. I was told by fully a dozen well-pleased owners of automobiles that the Reo would take any sand it came to without sand tires, but I claim the machine is not made which will run over the white, shifting sands of the Wyoming desert without sand tires or some similar help. This sand is so light and shifting that 2 minutes after running over it the tracks are entirely lost.

Several parties who have followed my articles in MOTOR AGE have asked me: "What are sand tires?" Replying to this question I would say that the sand tires used by me on this trip are made from plans drawn by R. E. Olds and given by him to the foreman of the Reo upholstering department, who worked out the plans and shipped the tires on to me at Cheyenne. They are made of several layers of a very heavy canvas, leather bound on the surface, and they strap around the rims of the wheels, with a strap for every spoke. The ends are drawn up tight and laced together with rawhide. The tread of the tire itself presents a flat-leathered surface in the center, surrounded on either side by a circular piece of canvas stuffed with wool. The flat center is about 3 inches wide and the sides of wool stuffed canvas are each about 2 inches in width, giving a total width of 7 inches. Seven inches of treading surface is found quite different from the ordinary width of the Diamond tire, 3½ inches, and prevents the heavy wheels from sinking to any considerable depth, no matter how soft and drifting the sand may be.

Bitter creek must be crossed at least a half dozen times in following the trail from the station of that name to Rock Springs. The bitter, greenish water in the bottom of the creek, so thick with alkali that it is actually encrusted in white in some places all the way across the stream, presents the most treacherous kind of fording. Sometimes the bottom is fairly hard, but oftentimes the entire bottom of the creek seems to drop out from underneath the car and the wheels sink into that sticky alkali mud until just the tops are visible.—PERCY F. MEGARGEL.



ARRANGEMENT OF SPACES IN GALLERY FOR THE 1906 CHICAGO AUTOMOBILE SHOW

YEAR IN SMOKY CITY

Pittsburg Dealers Report Sales of Nearly $1,300,000 Worth of Cars This Season

Pittsburg, Pa., Oct. 2—The business of selling automobiles is practically at an end in Pittsburg for this season. It has been a record-breaker. Over 600 first class cars have been sold, besides an extensive trade in second-hand machines being done. The total amount of this business was nearly $1,300,000, according to the best estimates obtainable from the dealers. Even for Pittsburg, the city with more multi-millionaires than any other municipality of its size in the world, this is a wonderful record, the more so when it is remembered that the automobile is decidedly out of its natural element in this city, where steep hills, narrow, crooked streets and poor roads make the task of running a car one fraught with much labor and danger. But the Iron city has got the fever and next year the automobile dealers confidently expect to see a total of more than $2,000,000 in automobile sales.

In general the season has been extremely satisfactory. The demand for automobiles was foreshadowed to such an extent early in the year that two new automobile companies were organized—the Hiland Automobile Co. and the Liberty Automobile Co. Two more companies have recently entered the field—the Pittsburg Motor Vehicle Co. and the American Automobile Co. The two concerns first named are both preparing to greatly enlarge their facilities and the latter two will erect plants at once. The expansion in the trade of the older firms has been no less noticeable than the starting of new ones and the success they have attained. The Banker Bros. Co. has nearly completed an addition to its garage, which will give it the largest space in the city, and the Keystone Automobile Co. and the Standard Automobile Co. are both considering extensions which are badly needed to take care of the rapidly growing business. The most sanguine dealer 1 year ago would have hardly dared to predict such heavy sales this year, especially as the weather during 5 months of the season proper was so bad as to make automobiling off the paved streets next to impossible. But the business has come and with it an increase in the automobile spirit that bids fair to sweep aside all previous records next season.

Two points stand out clearly in the season's business. One is the rapid and steady growth in touring. Two years ago a man who took his vacation in a car was regarded as a daring person. During the last few months hundreds of Pittsburgers, with their wives and families, have gone east and west, north and south—hundreds of miles over mountains and far away from model repair shops—and have returned, invigorated and elated with the wonderful exuberance and independence that attend the va-

Digitized by Google

tion trip in an automobile. Not to hazard a trip of a few hundred miles now is almost to court being called cowardly. Touring is quite the thing among the Smoky city motorists and they will bend their energies this winter to getting better roads, more charming routes mapped out and a closer connection with automobile associations in other cities and states that these summer trips may become still more popular and satisfactory. The other pertinent point in the season's trade is the increasing demand for heavy cars. This follows naturally as a result of so much touring. Then, too, automobilists have found that it needs a heavy and powerful machine to carry a party of six or eight persons up a steep grade on an unpaved street or even up some of the boulevard hills.

The year has been conspicuous for the few events in comparison with the long list pulled off the preceding year. The Automobile Club of Pittsburg has turned its efforts to better roads and fairer legislation. Working along these lines, it has not only gained a firmer foothold with automobilists themselves than by fast racing, but it has won a place in the public confidence, particularly in the country districts, that it never had before. Its efforts to get good roads are not overlooked by farmers and they are letting up on their hysterical shrieks against automobiling. City authorities, although they still fight the automobilists, are beginning to see the necessity for enactments that will give the motorists at least a fair show. Hence the craze for racing is slowly dying out. "One mile of good roads for every meet we don't have" is the motto of a big proportion of Pittsburg club men who are beginning to feel keenly the benefits of the sport as enjoyed in a rational and healthful manner. Racing will have a more or less precarious existence in Pittsburg. Automobiling, on the contrary, has come to stay and its devotees are increasing in numbers and loyalty at a rate that gives every dealer in the city good reason to feel happy and hopeful.

PANHARD'S NEW FEATURES

New York, Oct. 2—William Du Cros, of the family which handles the Panhard in England, is here on a business trip in the interests of the French car. There will be five models of the Panhard marketed in America this coming year—an 8-11-horsepower, a 15-20, a 24, a 35 and a 50. In the 1906 models the axle will be placed further back than usual, which enables the French concern to fit a side entrance without unnecessarily lengthening the wheel base. The 15-horsepower model has a hydraulic governor and a gear-driven pump, as well as a new system of suspension back springs. The 24-horsepower is an entirely new model built exactly like the Panhard 50-horsepower. The magneto is gear-driven, as is the pump. There is a hydraulic governor, push pedals and the steering column passes through the dash.

CHICAGO SHOW FACTS

Manager Miles Issues Diagrams and Application Blanks for Exhibition in Windy City

New York, Oct. 3—Manager Miles has issued to the trade diagrams and application blanks for the 1906 show at Chicago. He announces that all equipment will be provided by the management, the cost being included in the rental. There will be no other charge. No equipment or decorations other than that so provided will be permitted. The right is reserved to decline to allot space facing on two aisles and to allot consecutive numbers only if that plan should appear fairer to a greater number of exhibitors than the old system.

The allotment will be made on Wednesday, November 1. All applications received up to noon of Saturday, October 28, 1905, will have equal consideration, subject to the conditions named. Later applications will be given consideration after the first allotment has taken place. The price of space, per square foot, is as follows: All corner spaces, from 1 to 82 inclusive, including spaces 6 and 7, $1.15; all other space in all parts of the building, $1. These prices include suitable floor covering, dividing rails, signs, hanging, wiring and current, if electric signs are decided upon, furniture and all necessary decoration and preparation. The management will so prepare spaces that no attention on the part of the exhibitor to any of the usual details will be necessary. There will be nothing for the exhibitor to do except place his cars or other goods in position. No other decoration, electric lighting, furniture or other material likely to destroy the uniformity of the exhibition will be permitted to be used.

The gallery will be devoted to the exhibits of members of the Motor & Accessories Manufacturers and manufacturing members of the National Association of Automobile Manufacturers, and will be alloted by a committee of the former, members of each organization receiving equal consideration. The space on the second floor of the annex will be devoted to exhibits of other makers of and dealers in parts and accessories.

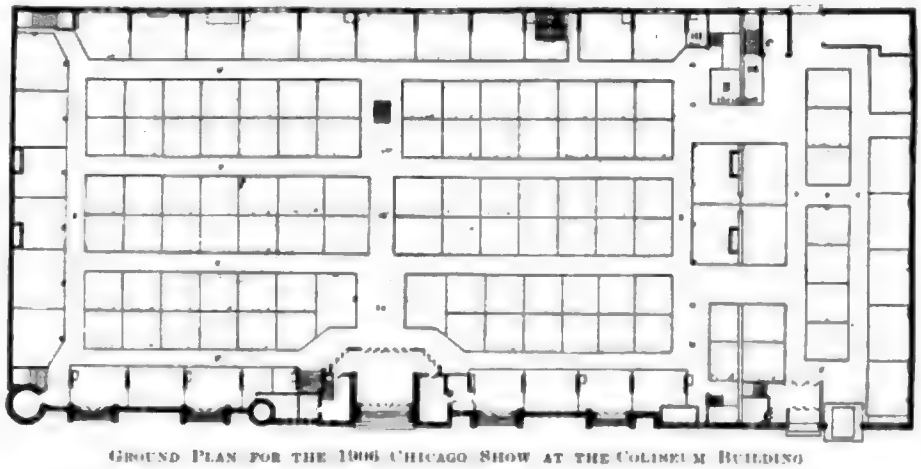
The show will be opened to the public Saturday, February 3, at 1 p. m. and each and every day thereafter, Sunday excepted, at 10 a. m., and will close each evening at 10:30 p. m. To the morning sessions, from 10 to 12, any automobile dealer or manufacturer will be admitted without charge by furnishing proof of his connection with the trade to the clerk of the bureau of information.

All of the spaces on the ground floor, in the restaurant and basement of Madison Square garden, have been allotted for the show of 1906. The spaces on the elevated platforms belongs to the parts and accessory makers and they with the importers will make their own allotment.

By a judicious selection of exhibits extreme congestion will be avoided. There will be not only room enough in the aisles for the comfort of the visitors, but room enough in the spaces, also, for their entertainment in a manner creditable to the industry. The decorative work will be on a scale of magnificence hitherto unkown in this country. Decorations for all the exhibitors will be in charge of the show committee and will be done by one decorator in one scheme. The color, lighting, sign and decorative scheme will extend throughout the building. Exhibitors in the gallery and on the main floor will be treated alike with respect to decorations and electric signs. There will be no individual plans allowed to mar the beauty of the general decorating scheme.

For the first time the show will be divided into departments. On the main floor will be pleasure vehicles, of gasoline and steam motive power. Electric vehicles will be in the Exhibition hall, otherwise used as a cafe. Commercial vehicles will be in the basement. For tires, parts and accessories the concert hall and platforms above the main floor will be used.

Motor car builders in the west as well as in the east are already talking the Chicago show proposition. The Windy City stands pre-eminent as a sale producing show. The individual manufacturers at the last show recorded unprecedented sales, and the 1906 show promises to be a leader.



GROUND PLAN FOR THE 1906 CHICAGO SHOW AT THE COLISEUM BUILDING

The Realm of the Commercial Car

An Ohio Inter-City Motor Bus Line

SPRINGFIELD, O., and three of its nearby towns are the scene of an inter-city motor bus line, the operation of which was started some 8 weeks ago and which is proving a good venture, as well as providing an excellent field for experimenting with the possibilites of the gasoline motor bus as a substitute for rural trolley lines, narrow gauge steam lines, or bus or stage coach routes. The scene of the experiment is to the south of Springfield, a city of 38,000 population, located in the center of Clark county, in the lower part of the state. South of the city, 8 miles, is Clifton, a typical 500-population town; 8 miles southeast of Clifton is Cedarville, with its 1,500 people, and 6 miles to the southeast of Cedarville is Jamestown, boasting its 2,500 residents. The three burgs lie south of Springfield as three lengths of a snake fence, the total distance between the termini being 22 miles.

The Commercial Transit Co. boasts a modest incorporation of $50,000, of which $20,000 has been paid in for preferred stock. John S. Harshman, of Springfield, the president, who for a long time has been closely identified with the leading traction line schemes in Springfield, is the promoter of the experiment and the turning of his attention from electric transportation to gasoline is not one of the smallest features of the enterprise. The circumstances, relative to the starting of this motor bus line, are interesting in that the line follows in the wake of numerous efforts to trolleyize the country roads joining these places, all of which exploded in mid-air owing to the sparsity of the rural population and the small population, as well, of the three places linked together by the system. The promoters of trolley lines figured that the number of people that could be looked upon as possible patrons of an electric line would not hand over to the company in fares enough to lay the rails, construct the roadway and operate a single car system over the line. This scheme would at best give poor service between the places—a service, in fact, not conducive either to inducing travel either among the ruralites along the line or with the burgers in the towns and villages passed through along the route.

Not one of the least important arguments in favor of the establishment of a motor bus line was the excellent condition of the roads. Few hills are encountered on the route. Along the road are many farmers, most of whom will not be slow to grasp the advantages of the motor bus. Bad country roads are the bugbear of the motor bus, as well as the passenger automobile, and Mr. Harshman, in deciding to take the bull by the horns, made a novel proposition with the commissioners of the counties of Clark and Greene, through which the route passes. He offered to aid in keeping the roads over the route in repair by spending at once $1,000 in improving the roadway, by filling in all holes along the route with stone, leveling all parts and putting the service in excellent shape by rolling. This offer was voluntary on the part of the president of the company and showed the determination to succeed which marked the initial efforts of the company. The president went further and arranged with the commissioners to share part of the repair bill for future years by agreeing to spend $100 a year in repair work on every mile of the road, the commissioners to spend a like sum.

The company began operations by purchasing from the Olds Motor Works three buses, with a carrying capacity of fourteen passengers each. The machines are of typical Olds construction, with 18-hors power motors placed vertically in fro Passengers sit on two side seats for passengers each and the cross seat for t driver accommodates two more passenge The body is bus shaped, with canopy t projecting over the driver, and drop s curtains so that in stormy weather passengers can be protected from weather. The company has added a luxuries of its own in the way of Apple dynamo for furnishing current small electric lights and for a headli The exhaust pipes are arranged to beneath the side seats, where heat spaces will be furnished, and the inte of the buses will maintain an even t perature.

Two cars are now running daily, third being retained for emergencies. schedule between Springfield and Ja town, 22 miles, calls for two round every other day from each machine two and a half round trips from eac the intervening days. The cars leav termini daily at 6 a. m., 9 a. m., 12 m 2, 4 and 7 p. m., one car making round trips or 88 miles every other the other making 110 miles or two a half round trips, or the machines to 220 miles every day. The single t made at a speed of 13 miles per h hour 45 minutes being needed for t miles. At each end of the route minute rest is given each machine. the schedule has been strictly adher but it is uncertain to predict what t winter months may do with the

The fares charged are base 2½-cent per mile rating, with of 50 cents between Springfie Jamestown, 22 miles. From running the cost of operation fairly well calculated. In a rou of 44 miles 4½ to 5 gallons o line are consumed and 2½ p lubricating oil. The former co cents per gallon and the la cents per gallon, making the for each round trip 57 cent operator is paid 25 cents an h as 2 hours are required for th trip an extra $1 must be add ing the actual operating expe

COMMERCIAL TRANSIT CO.'S MOTOR BUS

Digitized by Google

a round trip for each machine, $1.67. Four and a half such trips are made each day, so that the daily expense is $7.51 and the yearly cost amounts to $2,253.00. The company is allowing 2 cents per car mile for repair and depreciation. The two machines make together 220 miles each day or 66,000 miles per year, 300 days, so that the yearly repair allowance amounts to $1,320, which, taken with the annual fuel bill, gives a grand total of $3,573.

The three machines cost $6,600, an extra sum of $1,000 was spent in fixing up a garage and repair shop, and $1,000 was spent on highway repair. On this investment 5 per cent interest must be placed, which adds $430 to the total of $3,573 already reached, making in all $4,003 expenses for the first year.

Where are the receipts to cover this expenditure to come from and what will the company have as a revenue at the end of the year? Supposing that only one passenger was carried throughout the entire year, the receipts therefrom, at 2½ cents per mile, would be 2½ cents taken 66,000 times gives $1,650. Two passengers carried all of the time would give an annual revenue of $3,300 and four passengers would yield yearly receipts of $6,600. Take from this sum the operating expenses, $4,003 and there remains $1,597 as a dividend on the $20,000 paid up stock. A 5 per cent dividend on the $20,000 stock would only amount to $1,000, so there remains a margin of $597 for some things that are sure to lighten the coffers of the concern.

The company is anticipating running a similar line north of Springfield through Catawba, Mechanicsburg and Marysville, a total distance of 35 miles. A railroad links these points at present, but the service is so poor it offers slight advantage to the people in the towns passed and none to the farmers along the line. The company further shows its faith in the gasoline motor bus by ordering two 18-horsepower machines for use in and around Springfield. In the immediate vicinity of the city are such attractions as the Odd Fellows' home, Masonic home and Pythias home, all of which will lend aid to such transportation. It is the intention also of the company to rent the machines to picnicking parties at $5 per hour.

STOP NEAR CEDARVILLE, O.

A glance at the map, next page, shows the wisdom of running the line through Clifton, Cedarsville and Jamestown. The places are not linked together by a railroad and the trip to Springfield from any of the places means a roundabout run. The motor bus places the Jamestown people within 1 hour 45 minutes of the place. To the farmers the road is a boon. The buses stop at their gates and after taking them to market return them to their gates again.

A MOTOR AMBULANCE

John McCarthy & Sons, of Syracuse, N. Y., have put into commission one of the first automobile ambulances in that section. The White Angel, as it is called, attracts much attention. There are many new features in this ambulance. Mr. McCarthy introduced the first horse ambulance in Syracuse 16 years ago and has given free ambulance service ever since. He still keeps the horse ambulance for emergency. The new venture of Undertaker McCarthy was manufactured by the Brennan Motor Co. The body was made by Lansdale & Enright, carriage builders, who followed the plans laid out by Mr. McCarthy. The Brennan company made the chasis and engine, which is 16 horsepower. The car weighs 2,750 pounds.

The car has a sprag which can be dropped by the operator in case the machinery should fail to work on a hill. An immense gong is operated by the driver. A mica wind and rain shield is fitted into canvas, which when not in use is buttoned to the top. The car is equipped with 30 by 3½ inch Diamond pneumatic tires and anti-skids on the rear tires, and has a three-speed sliding gear with chain drive. The car is finished in pure white and lined throughout, including the ceiling, with red leather. On the right is a leather couch, upon which a patient reclines, and at its head is a leather seat for the doctor. Over the couch are brackets, similar to those seen in railway cars, upon which hats, coats and other articles may be placed. A lamp is placed between the two brackets and under the doctor's seat is a locker. There is a 14-inch walk between the couch and the left wall of the body, covered with matting.

The vibration is reduced to practically nothing by the fact that there are two floors, the upper floor, upon which rests the couch, being so arranged that it can easily be pulled out. The lower floor has doors, so that the machinery can be easily reached. Between the two floors a folding casket is placed. Should the patient die the casket is drawn out and the corpse placed therein. Between the floors there is also a canvas stretcher, which can be taken out quickly.

The speed of the ambulance is 25 miles

FRIENDLY TANK WAGON STOPS TO GIVE MOTOR CAR A SUPPLY OF FUEL

ROUTE OF THE OHIO INTER-CITY MOTOR BUS LINE

an hour. One night during the state fair the ambulance went from Mr. McCarthy's house to the fair grounds, a distance of 5 miles, in 15 minutes and in 20 minutes the injured man was in the hospital. The ambulance was put in service at the New York state fair grounds for 6 days, having been engaged by the fair commission. It responded to telephone calls all over the grounds, taking the sick and injured to the emergency hospital. The Monday following it was engaged to be on hand at the automobile races at the state fair track. The first call of the ambulance was to take an officer of the national guard to the railway station. The ambulance transported the treasurer of the fair and about $15,000 nightly from the fair grounds to the city. In the daytime the car is kept in Mr. McCarthy's barn. At night it is kept in front of the store ready for emergency calls.

EUROPEAN AMBULANCE FIELD

Europe, as with all other phases of the commercial use of automobiles, leads America in the ambulance field. Switzerland, with more than usual aggression, has a complete motor ambulance service in two or three cities, and on one or two of the popular mountain roads, small ambulances, driven by gasoline motors, are used. In Germany, it is all the army, and here we find motor ambulance corps a standard part of the brigade organization. The German types are propelled by the gasoline motor and also by the electric battery. The former is in the ascendancy. All of the machines have a running speed of 25 to 30 miles per hour and are fitted with large size pneumatic tires, but solid tires are suggested for active service. The chassis construction is similar to that in standard touring cars.

In France progress is slower; the army has been attending more to motor transport of ammunition and supplies rather than to such method of carrying the wounded. In Paris, however, over a dozen ambulances are in service, most of them being owned by the large hospitals and placed gratis for the use of patients. England, especially in old London, uses them in considerable numbers and in her African, Australian and American possessions the pneumatic tired gasoline machine is doing good missionary work.

MOTOR BUS ON DEFENSE

The development of the motor bus in England has led to a controversy between its advocates and those of the electric tramway as to comparative cheapness of operation, maintenance, and utility of the two systems. The cost of propulsion for each ton weight of electric car was recently placed by a dealer at 24 cents; that of the gasoline motor bus at 80 cents. This is claimed to be an unfair comparison, because the motor bus weighs only about one-third per seat of the tramcar weight. The motor buses so far in use in England carry from twelve to thirty-six passengers, though forty-two-seated ones are now being built. It is claimed that the operating cost per mile is but little more for the larger than for the smaller sizes. The double-decked tramcar seats from fifty to seventy passengers. It does not seem to be disputed that the cost of rubber tires for motor buses averages more than the cost of maintenance of car tracks, allowing for original capital expenditure. It is contended, however, that improvements, organization, and increased knowledge are reducing the operating expenses of the motor bus. These, according to the latest official statement made for the motor bus, are 16.10 cents per mile, including maintenance and all working costs; similar expenses of municipal tramways according to such statistics as are available range from 14 cents to 14.56 cents per car mile on an average.

The special claim made for the motor bus is its availability in certain localities and conditions where the tramway would be impossible or unprofitable. Therefore in urging its merits, it is presented less as a direct competitor of the tramway than as an auxiliary to or a substitute for it. One particular field for the motor bus lies in towns on routes where a sufficient number of electric cars could not be run to make a return on the capital outlay for tracks and equipments. In congested city districts like London about the Bank of England, where cars and car tracks would presumably be a serious obstruction, the motor bus expects a clear field. For limited rural service the motor bus is claimed to be particularly serviceable and economical and this is especially applied to instances where railways are now using motors to link their systems with attractive country and seaside places which have hitherto been practically inaccessible owing to cost of steam service

A SYRACUSE UNDERTAKER'S MOTOR AMBULANCE

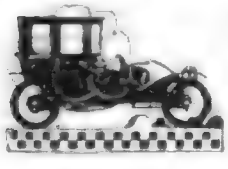
COMMERCIAL STEPPING STONES

Spain Wakes Up—Word comes from Spain that the municipality of Madrid contemplates the purchase of a number of automobile sprinkling carts for street use. American manufacturers have been invited to submit propositions.

Lansing in Line—Up-to-the-minute accommodations are being afforded travelers upon their arrival at Lansing, Mich. Plying between the depot and the hotels are two automobile buses. One is operated by J. A. Carr & Co. This machine is of the Olds manufacture and has a seating capacity of twelve persons. W. H. Porter is also operating an automobile bus in connection with a transfer line. His car is a Reo and also has a seating capacity of twelve persons. The cost to the patrons of the bus line will not be increased.

Russians Using Cars—Recent advices from Odessa, Russia, set forth the information that motor cars are coming largely into use for communication between country houses and the nearest town or railway, and also for inspection of estates. At present motor cars are supplied to Odessa by France, the United States and Germany. For touring purposes 12-horsepower cars are in demand, while for estate inspection, etc., cars of 8 horsepower have the call. Anyone who wishes to try his luck in south Russia should remember that the roads are bad and repair shops may be far away, so that strength and simplicity are more than ever desirable. Water is often difficult to obtain, so that steam cars should have water space sufficient for long runs without need of replenishment.

Oldsmobile in R. F. D.—A. H. Helgesen, R. F. D. carrier No. 5, out of Montevideo, Minn., in a recent conversation with a MOTOR AGE representative, spoke in the following terms on the work he is doing with an Oldsmobile runabout in covering his route: "My route is 24 miles. In making the trip I require 2 to 2½ hours and never over 1 gallon of gasoline on good roads. Then the machine does the work of a team of horses, but in very bad weather and on poor roads I do not use it at all. The expense is greater than a team when I run it all the time. Here are a few of the expense items I have had to face: General repairs, $30; new carbureter, $12; new chain, $8.40; special improvements of my own, $10; new tires, $62. The advantage in using the automobile is in the time saved and in drawing trade in other lines that could not otherwise be secured. All through I am pleased with the machine, but would think it an advantage in having a 12 or 16-horsepower machine so it would plow through sand, mud, snow and all." This machine has been in use for 16 months. The daily start on the delivery trip is at 2 in the afternoon with sixty-four mail boxes to be visited. The trip is finished in 2 hours, but when horses are used the start is made at 1 o'clock and the finish made after 5. The car often covers 120 miles a day, in addition to the regular mail route, when other work is being done.



New Quaker Line—Philadelphia is reveling in automobile bus lines these days. Besides the numerous rubber-neck wagons, to which the many conventions held in the Quaker City recently have brought a land office business, the Atlantic City line, which runs tri-weekly, is becoming a fad, while a line which does Fairmount park four times a day has more patrons than it can attend to. Last week another daily line was inaugurated, the objective point being Valley Forge, the start being made at 1:30 o'clock in the afternoon and the return trip being completed about nightfall. It is rumored that by next spring a line of fifty electric buses will be in operation on Broad and Diamond streets, at regular street car fares.

Clevelanders Fight Over Car—The municipal automobile which was purchased a few weeks ago for the benefit of the city fathers of Cleveland, Ohio, is causing a lot of trouble. The city council authorized the purchase of the machine, a 40-horsepower Stearns and the hiring of a chauffeur, without any very clear restrictions as to who should use it. The result is that about every one of prominence in the city hall has had a ride and since then they have all wanted more rides. The poor machine has had no rest and the operator has threatened to quit his job unless some sort of a plan is worked out for regulating the matter. The prospects are that the council will be asked to authorize the purchase of several machines in the very near future, as there is no other way to settle the controversy.

To Build Gyroscope Wheel—The Couple Gear Freight Wheel Co., of Grand Rapids, Mich., has let the contract for the erection of a factory. The new structure will be of brick and will cost $10,000. The machinery, which will be installed, will cost in the neighborhood of $70,000. The company was recently organized in Grand Rapids to manufacture the gyroscope wheel for electric trucks and is an offspring of the Holson Motor Patents Co. The plant is expected to be in operation by January 1, 1906. The company will manufacture, besides the wheels, the complete chassis, embodying everything in the truck but the body, batteries and tires. But one size of wheel will be produced at the new plant. Other sizes will be manufactured at other plants, which will be built by the company as the demands of the business make them necessary. The wheels to be manufactured by the company each contain an individual motor, fed by batteries underneath the truck.

Jewelers in Line—Bailey, Banks & Biddle, the famous jewelers of Philadelphia, have just added to their delivery service two Cadillac delivery wagons. The company proposes in the near future to almost entirely supplant its present horse delivery with motor wagons.

Southerners Try It—The R. Haury Co. has put in operation the first motor delivery wagon introduced in Nashville, Tenn. It is a 12-horsepower Cadillac and now the Merchants' Delivery Co., that operates some twenty wagons, is figuring on the installation of similar vehicles. This is sure proof that the commercial cars have made a hit there.

Beats Jim Crow Line—Among the recent enterprises in Nashville is the Union Transportation Co., capitalized at $25,000, which was granted a charter by the secretary of state to do a general transportation business. Immediately after the enforcement of the Jim Crow law colored people began to ride on the cars only when necessity demanded. Becoming tired of walking, the more wealthy colored citizens hit upon the idea of organizing the transportation company. Five big passenger automobiles have been ordered from New York and are expected in Nashville soon, when they will be put into service, one in each of the four sections of the city, north, east, west and south, while the fifth will be retained as an emergency machine. Work has begun on the erection of a new garage for the reception of the automobiles. The colored citizens of Chattanooga have started a similar movement.

Test Was Satisfactory—J. A. Cramer, of Buffalo, is showing the first of the Premier business wagons taken to Buffalo. Almost the first day the Premier was there Mr. Cramer sent it to Hamburg, 12 miles out into the country, with a load of 800 pounds of plumbers' supplies for a new building. Nine men rode in the car also. The time consumed on the trip was not recorded, but it must have been satisfactory, for next day the plumbers ordered one of the cars, specifying that the body be made extra large to accommodate even more of a load than the 1,800 pounds which the Premier people intended the car to carry. This is the first time Mr. Cramer has become much interested in a business automobile and he believes that the time is coming when Buffalo, because of its smooth asphalt paving, will be the leading city of the country for commercial motor cars.

ROADSIDE TROUBLES

An Ounce of Prevention

Copyrighted by the American Motor League

By Chas. E. Duryea

TIRES—Good tires give little trouble, watch them constantly. It is advisable never to start, after stopping without a look at the tires, for driving on a flat tire is apt to tear off the valve tube and pinch a number of holes through the tube. In some instances it will damage the outer cover irreparably and may damage the rim. If the tire is flat and a quick inspection does not show a nail or other cause, apply the pump and note the result. If it inflates properly a slight leak is probable. In this event test the valves; for about half the tire troubles, as shown by the New York-Boston reliability run, are found in the valves. This is done by immersing the stem in a glass of water, the valve being at the top of the wheel. If no leak is found here it must be elsewhere and the tire, if single tube, must be placed in a tub of water. If double tube, the tube must be removed, when the leak ordinarily can be heard or felt, but if very minute the tube may need testing in water. Repair instructions commonly accompany tires and therefore need not be included here.

TIMELY HINTS—A few remarks, however, gained from a long experience, will not be amiss. Always take the precaution to see that your valves pump easily and hold the air with reasonable certainty after the tire is inflated, for it is a decidedly unpleasant experience to be obliged to work hard and long in a hot sun after a tire has been repaired, because either the valve is not in good condition or will not hold air long enough to permit the cap to be applied. Valves, theoretically, should open at less than 10 pounds pressure, but in practice the resistance offered frequently necessitates several times this, thus unnecessarily doubling the already hard work of inflating a large tire. Pumps, too, should be given their share of attention to see that they work properly at high pressures, for it is far more important not to lose air after the pressure gets higher than at the beginning when the work is slight. The rubber tube and the passage through the connections, from the pump to the tire, should be kept clean and free, for much resistance is often found here, materially adding to the labor. The ordinary metal tube containing rubber solution permits of more or less evaporation, so the solution gets thicker than it should be.

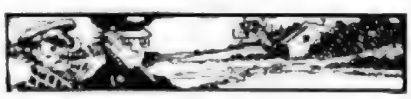
RUBBER SOLUTION—Most tire makers are over-conscientious about their solutions and furnish it already too thick for the best results under the hurried conditions usually found on the road. A thick solution does not set quickly and if the patch is applied while the solution is yet soft it does not hold firmly and may give trouble immediately after inflation and use, particularly if the road surface is hot, which tends to loosen the patch. A little gasoline will thin the solution, and there is not much danger of getting it too thin. A solution tube apparently half empty may be filled with gasoline, and after a day or two will be better than ever before.

PATCHING—It is particularly important that the surfaces of the rubber be clean. Sand paper is ordinarily and quite properly used to roughen them but its beneficial effect is rather that of cleansing than roughening. A clean, smooth surface will hold better than a rough one. Hard rubbing with gasoline on a bit of rag will generally remove all dirt, powder and "bloom" and leave the surface in perfect condition to receive the solution. Above all, water must be kept away from the surfaces, for it will neither permit the solution to adhere nor will drops of water dry rapidly if they are once smeared with solution, which excludes the air. In case of a torn valve stem, the surface can be smoothed by rubbing with a hot poker, taking care not to burn through the tube. It is usually possible to secure a smooth surface for the new valve in this way much more readily than by cutting with the average knife. One caution is to take ample time in making a repair, particularly allowing the rubber solution to get thoroughly set before applying the patch, and if time can be given it before using, all the better. Heat tends to soften fresh solution and loosen it, so avoid the hot sunlight or hot roads with a fresh patch as much as possible. If the tube cannot be repaired, wrapping the rim with rope will permit the vehicle to be driven, at a slow speed, of course. With rims having no sharp edges like the Dunlop and a little care in driving no harm results from running with the ca inside the shoe, the tube being remove The tire being larger than the rim is likel to jump off, but several miles can sometime be covered in this manner slowly but su cessfully and without apparent damage t either the rim or the tire. If the sho is left in place in the rim, the edges tend t bind on the rim while the outer portion crowded forward, thus wrinkling the shoe : several places and breaking both rubber a fabric. A shoe can be destroyed in this w in a very few rods.

OIL ON RUBBER—Rims should be ke painted on the inside, for rust not only h a damaging effect, but, being rough, it ten to chafe the rubber in contact with it a prevents a water-tight bearing of the t against the rim, thus further aggravati the rust by admitting water, which also w the tire fabric and soon rots it. Light r are absorbed by rubber which causes it swell and lose its strength as if rott Gasoline, on the other hand, although quic absorbed, quickly evaporates, leaving rubber uninjured, while heavy cylinder are usually so thick and heavy as to be sorbed but slowly and on this account not likely to do much damage. It is advisable, however, to leave oil on the ti

JACKS—In removing a tire or a wheel the vehicle is heavy, a jack is necessary. light, the tire may be applied at the and then the wheel rolled so as to br the portion of the tire that is on the underneath, after which the remainder the tire can be applied. Some people c a jack with them but if not at hand can commonly be made by using a bo a stick of wood of proper length, or a s of wood rather too long and a rail. Put rail under the axle, the stick of wood u the rail with its top leaning toward vehicle, then push the vehicle on the which tends to straighten the stick, lifting the rail and the wheel clear from ground. Usually something available hold up the wheel will be found in the mediate neighborhood when needed. S vehicles are constructed with their wh readily removable, which is a decided venience in cold or stormy weather, permits the repair to be made under sh instead of at the vehicle. In this event must be exercised to see that the jack ing the axle is secure, for dropping one of the axle will not only twist the ve badly but may damage some of the pa

CLEANING THE HANDS—In repairing the patching solution frequently get



EDITOR'S NOTE—This is the eleventh of a series of articles by Charles E. Duryea. These articles will be prepared for publication in book form and will be distributed by the American Motor League to its members during the coming year.

Digitized by Google

over one's fingers. This, if combined with soap, becomes insoluble in water and is a very nasty grease to remove. It is best to not use soap but either wash the hands free from dust in clean water and then rub the solution off or rub it off before using water at all. When the solution is dry it rolls up easily, so that the hands are readily cleansed of it by a little rubbing.

LARGE TIRES BEST—When choice of tires is possible the buyer should take the benefit of the doubt. A small tire, although cheaper to buy in the first place, does not give as good satisfaction, for the money invested, as a large one. It is readily seen that a small boot heel will wear out quicker than a large one, and tires behave likewise. A tire of large section on a wheel of large diameter presents a large surface to the road and is but little damaged by usage, whereas if but a small section is presented, the weight causes the rough road surface to tear away and destroy the rubber, quickly ruining the tire. Large tires on large wheels, therefore, are not only a matter of comfort, but of economy. This fact is particularly true of the driving wheels, which are subjected to greater strains than the steering wheels, and should therefore be provided with larger tires. The use of large rear wheels is to be favored, for these must carry the major portion of the load and it is poor economy to use small tires on them simply to have all four tires alike.

AVOID MUD—Since heat softens rubber and water makes it cut easily, tires give best service in cold and dry weather. On a rainy day the tires are not only wet but the road surface may be so soft as to expose sharp points imbedded in the solid earth beneath, which points readily do damage to the rubber and it is a matter of common experience that tire troubles more usually occur in bad weather. Care should be exercised in driving to avoid mud and hot sun as much as convenient.

WINTER USE EASY—While admitting the above, many people think that winter use is exceptionally hard on tires, whereas the reverse is really true. The carpet tacks and bits of glass so frequent in the summer are often buried under a layer of clean snow in the winter. The sprinkling cart fiend is absent and the gutters are frozen solid, thus presenting not only safe surfaces but fairly level ones for winter use; while there is no heat to soften patching solution and give trouble on this account. A careful record of mileage will show most tire troubles during hot and wet weather and least during cold weather. If the vehicle is not used during the winter it should be lifted on jacks so as to remove the weight from the tires and the air pressure in the tires should be reduced considerably to avoid any unnecessary strain on the fabric. Care should be taken to see that they are not in proximity to heaters likely to damage the rubber. They should not be overdamp, for it rots the fabric, nor overdry, for it cracks the rubber. Tires should be well cleaned before wintering the machine.

DEVELOPMENT BRIEFS

Imports of August—According to the latest returns, ninety-two automobiles, valued at $331,782, and $30,393 worth of automobile parts were imported into the United States during August. During the 8 months ending August 198 cars, valued at $715,836 and $47,101 worth of parts, were imported.

Experimental Car Ready—The experimental automobile which has been for some months under construction at the plant of the Ellis Omnibus Co. at Cortland, N. Y., has been completed and will soon be tested out. The engine is the invention of Thomas Kennedy, a former employe at the Franklin works at Syracuse. Others interested are D. W. Van Hoesen, Dr. E. M. Santee, John Dowd, W. W. Bennett, E. E. Ellis and C. F. Weiler.

Foreign Idea of Elegance—Director General Wickuler's 40-horsepower Metallurgique car, the body of which was built by George Kruck & Co., of Frankfort-on-the-Main, Germany, was awarded first prize for elegance in the recent competition at Homburg. The Kruck tonneau is a kind of limousine, yet so artistically fitted up that all windows can be flapped upward and made fast beneath the roof. The back seat affords accommodation for three persons, that opposite, furnished with arms, for two. Neither driver nor mechanic has any just cause to complain on the score of comfortable sitting, as each seat may be described as a veritable easy chair. Leather upholstering has been employed for the interior, which is fitted up with a couple of cupboards, with wet goods, pharmaceutical case, with bottles and glasses, two movable arm-slings, folding tables, speaking tube for communicating with the driver, ash trays, visiting card pockets, a luggage net, etc., etc. On the ceiling is a powerful electric lamp. The travelers' boxes are stowed away behind on a brass support and fashioned to fit exactly into the back of the tonneau.

Two-Cycle for Olds—The Olds Motor Works of Lansing, Mich., is presenting to the 1906 trade a two-cycle, two-cylinder car. The cylinders are mounted vertically and will generate 20 horsepower. Special features in motor construction are an exceptionally small crank case, so that good pressure is had for forcing the mixture into the cylinders and peculiarly shaped inlet ports.

August Exports—The upward tendency of the American automobile export trade continues, the latest statistics showing that during August automobiles and parts to the value of $260,853 were shipped abroad, as against a value of $168,303 during the same month a year ago. During the 8 months ending August, 1905, these exports were valued at $2,041,134, as compared with a value of $1,322,499 during the same period of 1904 and $1,049,311 for the 8 months' period of 1903.

New Armored Cable—Herz & Co., of New York, have just brought out a new ignition cable. Several layers of rubber alternate with a secret compound and the whole is covered with an armor of steel, which protects the cable but does not interfere with flexibility. The outer steel armor is brought into conducting connection with the ground. This cable is sold cut to the length required and fitted with special terminals, ready to be hooked to the engine, either for primary or secondary.

Non-Fluid Oils—The New York and New Jersey Lubricant Co. calls attention to the impression that has been gained that its oils are of the nature of compression grease. The claim is made that the lubricants put out are in no sense of this character but are just what they are called, non-fluid oils, doing all that other oils will do and without the disadvantage of running or leaking.

Changes Hands—The Eureka Separator, a device for separating water from gasoline, is hereafter to be manufactured by the Winkley Co., of Detroit, Mich. The device was formerly manufactured by the Eureka Separator Co., of Rockford, Ill. The water, in passing through the separator, settles below a screen, while the gasoline passes through a screen, where an even flow of gasoline to the carbureter is assured. All other impurities, such as dirt, rust, etc., are taken from the gasoline in the process and the drain cock, at the lower end of the separator, enables the operator to draw off the water and dirt and clean the tubing.

Maxwell-Briscoe Plans—With two additional factories—one at Providence, R. I., and the other in a western city not yet fully decided on—the Maxwell-Briscoe Motor Co., with the main plant at Tarrytown, N. Y., announces it will produce at least 3,500 cars in 1906. They will be practically the same as this year's models, the company claiming to have found no weaknesses or any feature that required any radical change. One of the tests recently given one of the small stock cars was a run from Boston to New York, a distance of 286 miles, in a little less than 11 hours on 12 gallons of gasoline, the average speed being 26 miles an hour.

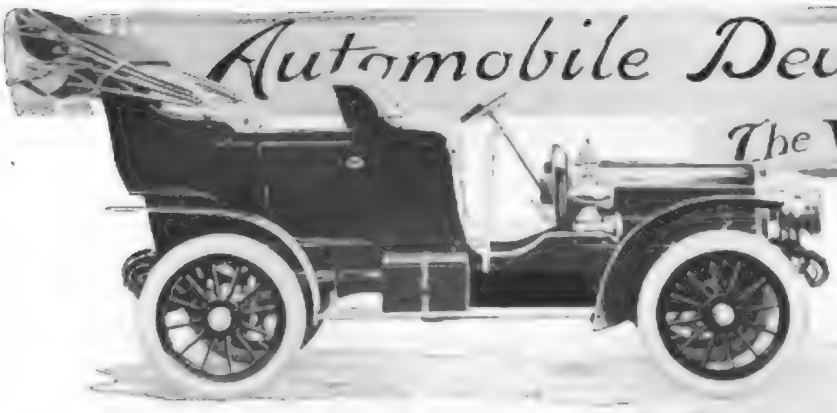
Automobile Development

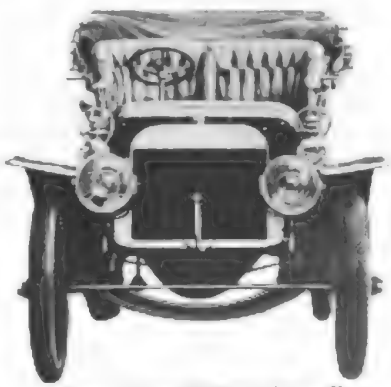
The Winton - Model K



THE offering of the Winton Motor Carriage Co., of Cleveland, O., to the automobile public for the coming season is a large touring car, to be known to the trade as model K. It follows Winton construction lines, as used this season, but differs in being fitted with jump spark ignition from storage battery, a Hill mechanical oiler, a new style of carbureter, new front and rear axle design and in the grinding of cylinder parts. Well known features retained are individual clutch transmission, air control of inlet valves, twin springs and vertical motor with cylinders cast in pairs.

The channel section side pieces of the frame are parallel throughout, being tapered toward the front and rear, where they terminate in long hook-shaped spring hangers. The motor and transmission are carried on drop cross pieces, dispensing with the use of a sub-frame. Four twin semi-elliptic springs are fitted, the rear pair swung beneath the frame pieces. All are shackled to the frame and spring hangers in the usual way. The front axle is new and made from I-section manganese bronze and drops from where the steering knuckles are carried to the center for crank case clearance. In the factory it is tested to a tensile strength of 90,000 pounds per square inch. On the axle are integral steps, on which rest the springs. The steering knuckles are of Lemoine type and Timken conical roller bearings carry the road wheels. The drive shafts in the rear axle extend from the hub caps to the spur gears in the differential and the shafts are so designed that when the hub caps are removed they can be withdrawn and the differential dissembled. This is accomplished by having the axle casing carry the total weight of the machine. Conical roller bearings are fitted throughout the axle and truss rods with turnbuckles for adjustment are connected with the ends of the axle casing and pass beneath the center of the differential casing. The top half of the axle casing, being removable, it is easy to inspect the differential gearing. The road wheels are 34-inch artillery pattern with 4-inch tires, and the wheel base is 8 feet 6 inches.

Four vertical cylinders, cast in pairs, and with a bore and stroke of 4⅝ and 5 inches, respectively, are used in the motor. The rating is not given in connection with the machine, but at 1,000 revolutions per minute between 35 and 40 horsepower should be generated. The heads, water jackets and valve ports form an integral casting. The crankcase is split vertically, in line with the crankshaft bearing, so that half of it can be removed without interfering with the mounting of the cylinders and the crankshaft and pistons removed. In this removable side are two large inspection plates, one to each pair of cylinders, which are quickly removable, accessibility being one of the leading claims for the motor. The valve ports are on the right side, the automatic inlets being located in the top of the ports and directly above the exhausts in the port bottom. The camshaft is enclosed within the crankcase, and between the gear which it carries and all other gears are intervening fiber gears. The crankshaft is a three-bearing, drop steel forging. One of the noticeable changes within the cylinders is the grinding of the cylinder walls, the surfaces of the pistons, the piston rings and the valves, in defense of which the company claims better compression and easier movement. The arched-top piston remains, and carries on its upper end three compression rings and on its lower parts has oil grooves. The connecting rods are not split at the wrist pin ends, but fasten to the crank pins by means of an angular split, as used in this year's machines. The exhaust valves have long stems which at their bottoms screw into short seats that carry rollers, against which the cams bear. The use of push rods is in this way eliminated. To remove the exhaust valves, the inlet valves are taken out and then the exhaust valve stems are unscrewed from the seats. The inlet valves are directly above the exhaust valves and on the top part of the stem carry a piston working in an air cylinder by means of which the opening of the valve is regulated. The air when admitted beneath the air piston hinders the opening of the valve and consequently the speed of the motor is reduced. To accelerate, a push button on the footboard cuts out the air from the air pump to the cylinder.



FRONT VIEW WINTON MODEL K

In the center of the cylinder heads are vertically mounted the spark plugs. Current comes from a 6-volt battery and a set of dry cells carried in a lock box on the running board. The commutator, on the dash, has a roller contact point working against hardened steel contacts. Near it is a four-vibrator spark coil and on the steering wheel is the spark control lever. For those desiring it a magneto for ignition is included in the regular equipment.

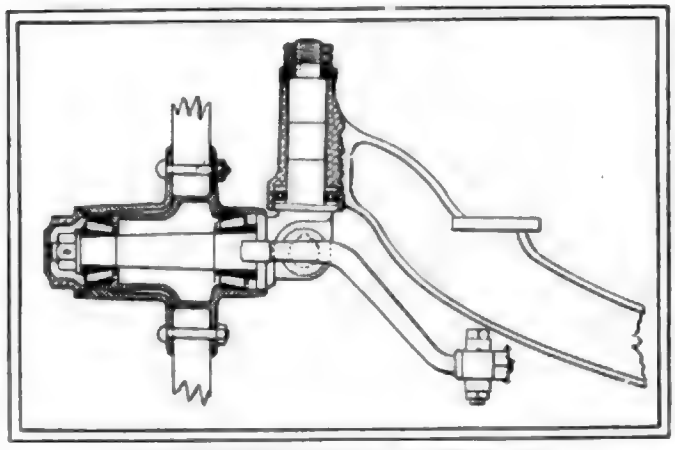
For motor lubrication an eight-feed Hill mechanical oiler is installed. It supplies all motor bearings. To the cylinder walls and bearings are separate leads, and the oil, after being used in the bearings, enters holes in the crankshaft and is conducted through it by centrifugal action to the crank pin bearings. The oil grooves in the piston are filled from the splash and distribute lubricant over the entire cylinder walls. On the dash are located the sight feeds, making it easy to watch the lubrication of the machine. In case the oil is congealed in the tubes or oil pipes a pressure of 100 pounds is brought to bear upon the liquid to force it into the bearings. When in the oiler air pressure is not used no other pressure is resorted to, but this pressure is used in forcing the oil from the large oil tank to the oiler.

Water circulation is effected by means of a centrifugal, gear-driven pump carried on the motor. The radiator has vertical tubes and behind it is a fan, as well as fan spokes in the flywheel. On the generator fan is a friction clutch, permitting it to start gradually when the motor starts quickly.

The carbureter, of Holley design, has a float concentric with the spraying nozzle. It is of the compensating type and

Digitized by Google

automatic in its working. Gasoline carried in a tank beneath the frame at the rear of the back axle is forced by air pressure to a small supply tank on the rear side of the dash, and from this tank the fuel flows direct to the carbureter. The pressure in the main gasoline tank is furnished by an air pump on the front end of the motor. The carbureter is not adjusted in controlling motor speed, it being first adjusted and then not resorted to, the spark and air-controlled inlet valves being the only motor regulators.



WINTON STEERING KNUCKLE AND FRONT AXLE

The individual clutch type of transmission comprises one of the unique features of Winton construction that has been retained. In the illustration the main shaft A is connected with the crankshaft through a universal joint Y adjacent to the flywheel so that when the motor is running the shaft is revolving. The propeller shaft B drives to the rear axle and C is the countershaft. The black, heavily-shaded parts, on the main and countershafts are gears which are always in mesh. It can be noted by the keys shown on the shafts which of the gears are rigid with the shafts and which run idle on them. Within three of the gears are cone clutches for locking loosely-mounted gears to the shafts. The transmission gives two forward speeds and one reverse. To obtain the direct drive the shaft A must be coupled with the shaft B. Rigid with A is the clutch D bearing within the gear E. The clutch is forced against E by the collar K being slid so that its ball forces the dog F against the disk G which in turn bears on the connection plug H, which pushes, through the gear O, against the clutch and forces it into the gear E, thereby causing the gear to revolve with the main shaft. But the part M of the gear is bolted to the casing, which unites through a universal joint with the shaft B and the drive to the back axle is accomplished. The cone N is used to assist cone D in driving to the gear E, so that danger of cone slipping is reduced by using two cones instead of one. For slow speed ahead the drive is from the main shaft through the gear O to gear P, which is made rigid with the shaft through the clutch R and then through gear Q to gear E and shaft B. For getting the reverse gear S drives to an idler Z and it drives into gear T secured through the clutch X to the shaft C, and gears Q and E complete the circuit to the shaft B. For operating the clutches two levers are needed: the inner one pushed ahead gives the reverse drive and slow speed ahead when drawn back and the other when drawn back gives direct drive and, when advanced beyond neutral, applies the emergency brake on the drive shaft. Small springs are used with each clutch for disengaging it when a drive is changed. The entire gears and clutches revolve in oil so that when applying a clutch there is an oil film between the male and female part which has to be expelled before there is a positive drive between the two, permitting of a gradual application.

The propeller shaft is universally jointed in front of the differential casing. In the braking system are three external friction band brakes, two working on cast iron hub drums on the rear wheels are applied by pedal and used for regular use, and one on the rear end of the transmission shaft and operated by a forward movement of the high-speed lever serves for emergencies only. The placing of the regular brakes on the rear hubs is to save the machinery from all strain in the frequent application of the regular brakes.

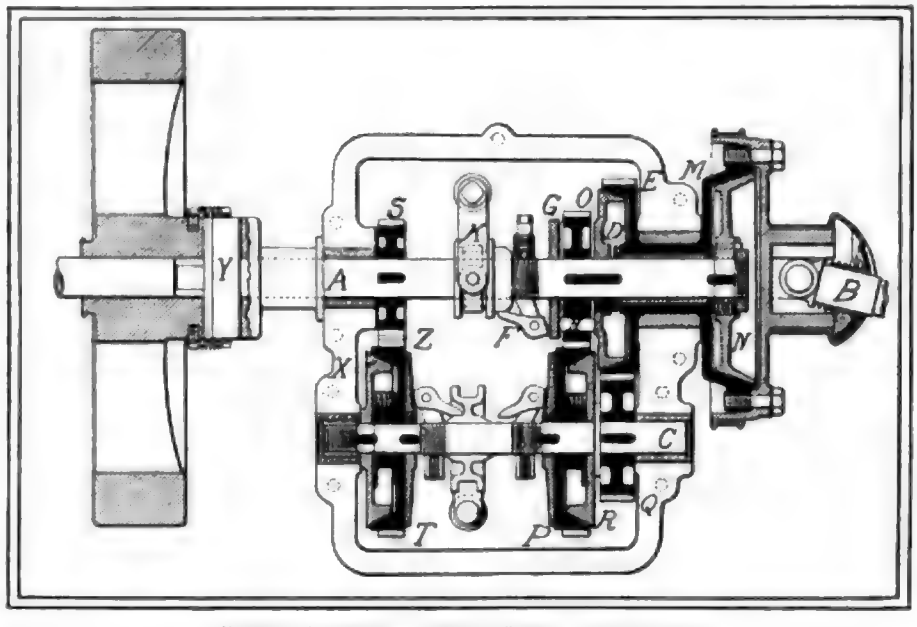
The muffler, an improvement over this season's, is a cylindrical chamber with a double sheet iron casing, the casing parts separated by an asbestos lining. Within the chamber is a number of circular disks, practically equal to the inner diameter of the casing. Alternate disks have openings near their peripheries and the intervening disks near their centers, so that the exhaust gases take a zig-zag course in passing through the muffler.

The control of model K is little different from this year's models. The levers at the right serve for giving speed changes and applying the emergency brake; in the footboard is a push button for regulating the opening of the inlet valves, and beside it is a regular brake pedal. The spark control lever is on a quadrant on top of the steering wheel.

The body design is similar to model B of this year, but the addition of a hollow metal dash and different side entrances as well as rear seat curves are noticeable. The backs of both seats slant considerably, but the upholstering is not heavily rolled above them. The running board and small fenders are adhered to. The finish is in green, maroon, red or blue, with different colors of running gear.

THE NEW POPE-TOLEDO

"Quiet-Mile-a-Minute Pope-Toledo" is the name of the new touring car to be put on the market by the Pope Motor Car Co. for the season of 1906, to be called the Morlee XII. As compared with the cars of previous seasons, the new car is described as having more power, more speed, more room, more style, more strength and less weight. In the motor design the company aimed to produce the greatest efficiency for the least weight in the construction of a gasoline engine. Without sacrificing strength, the engine to be installed in the 1906 car is a feature and the claim is made that a very remarkable result has been attained in securing 1 horsepower for every 10 8-10 pounds of motor weight. The motor is composed of four individual, twin-head cylinders, with copper jackets, and will develop



WINTON INDIVIDUAL CLUTCH SPEED CHANGE GEAR

Digitized by Google

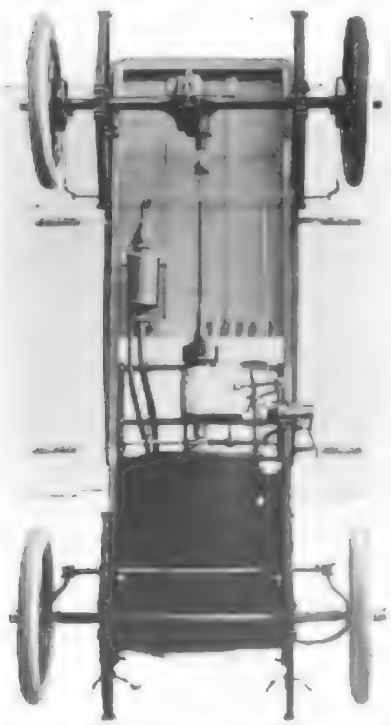
43 to 44 horsepower under brake test. The Pope-Toledo radiator is used and all gears are encased. The body design is entirely new. Having a double side entrance, the body is provided with a large, roomy tonneau. The front seat is divided.

The Pope-Toledo people have much to say about the steel used, all being forged at the Toledo plant, the axles being tested to 110,000 pounds tensile strength, while that used in the transmission is of 210,000 pounds tensile strength. There is direct drive on the high gear, with no idle gears in mesh. Side chain drive is retained. The tank holds 17 gallons of gasoline, designed to carry the car 270 miles. The wheel base on the new car is 104 inches, all four wheels being 34 by 4 inches in size. In the proportion of power to weight, the new Pope-Toledo car has 1 horsepower for every 54 pounds weight.

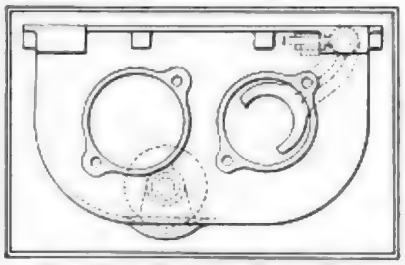
FOUR FRANKLIN 1906 CARS

Four models are offered for next year's trade by the H. H. Franklin Mfg. Co., of Syracuse, N. Y. These are known as models E, D, G and H—the first a light roadster slightly different from the light car of this season, the second very similar to the present large touring car, the third an entirely new model with four cylinders placed longitudinally, with multiple disk clutch, sliding gear transmission and shaft drive, and the last a six-cylinder machine with disk clutch and sliding gear transmission. The construction of the Franklin motor is different in many ways from the present style, but air cooling is adhered to, with all the valve cages provided with flanges. The leading innovation is the use of a sliding gear transmission and multiple disk clutch.

In model G, a description of which follows, ash sills form the side pieces of the



Bottom View Franklin Model G Chassis



End View Franklin Crank Case

frame, which are suitably braced together. Four full elliptic springs, clipped beneath the axles, carry the frame. The front axle is made from nickel steel and is heavily dropped from steering knuckle to steering knuckle. The rear axle, of the divided type, carries the bevel gear differential in an oil-tight case in the center and the drive shafts revolve on roller bearings. Thirty-two inch wheels are used.

The 12-horsepower motor has four air-cooled cylinders mounted longitudinally beneath the bonnet. Each cylinder with 2¼-inch bore and 3¼-inch stroke is a separate casting, the walls, head and cooling flanges being made integral. In the head are two openings side by side, the forward one for the exhaust valve and the inlet valve opening just behind it. In the top of the cylinder wall, at the right side, is a spark plug opening, and near the bottom of the wall, on the opposite side, is an opening for the attachment of the casing carrying the auxiliary exhaust valve. The crank case, roughly speaking, is cylindrical in shape, with both ends, the top and one side left open. To the four top openings are bolted the cylinders, each by four bolts, in one side are two large inspection plates, for gaining access to the crank shaft and connecting rods, and on the ends are bolted the plates that carry the crank shaft and cam shaft bearings. From the side, the case has a corrugated appearance owing to it being slightly contracted between the cylinders for the carrying of a crankshaft bearing. The case is supported from the frame side pieces by horizontal cross angle pieces, one crossing between the first and second cylinders and the other between the third and fourth. These angles are bolted by two bolts each to the top part of the case and at their ends rest on angle pieces secured to the sides of the frame.

The crankshaft is a 1¼-inch steel forging with throws mounted at 180 degrees and revolves in five 1⅞-inch bearings, two at the ends and one between each two of the cylinders. The intermediate bearings are carried on pedestals, held in place by bolts passing through the base of the case. The pistons have flat tops, which with the level heads in the combustion chambers makes a perfectly cylindrical combustion chamber. Three compression rings are all above the wrist pin, which is of ¾-inch diameter and pinned to the piston journals. The connecting rods are made from I-section metal and bronzed and babbitted at both ends. The connecting rod cap has a horizontal split with the connecting rod and is bolted and cotter pinned in place. Crank pin bearings are 1¼ by 1⅜ inches.

The mechanical inlet and exhaust valves are made of nickel alloy. Each valve sits in a valve cage, cooled by vertical, longitudinal flanges and held to the cylinder by a pair of screws. The cages are snail-shaped, with the large end opening meeting the opening in the pipe from the carbureter, and in the case of the exhausts, the pipe to the muffler. The cooling of the cages is new with this model. The pipe from the carbureter is a short vertical one which unites with a horizontal pipe lying as close as possible alongside the top of the cylinders, the openings in this pipe facing the openings in the valve cages. The exhaust pipe connection with the exhaust valves is of identical construction, two bolts holding the horizontal pipe to each valve cage. All valves have a diameter of 1⅜ inches and a lift of 11-inch. The stems are ⅜-inch diameter. The valves are ground to 45 degrees. Each is operated through an over-head rocking arm, one end of which rests on the top of the valve stem and the other end carries a vertical screw with a cone-like cavity in the bottom and in which rests the upper rounded pointed end of the push rod. On the cam shaft are twelve cams, four for opening the inlet valves, four for the main exhausts at the cylinder heads and four for opening the auxiliary exhausts near the cylinder base. This year's machines use automatic valves here, but the new models use the mechanical. The 1 3-16-inch auxiliary exhaust valves are ¼ inch above the tops of the pistons when at the bottom of the stroke. The c

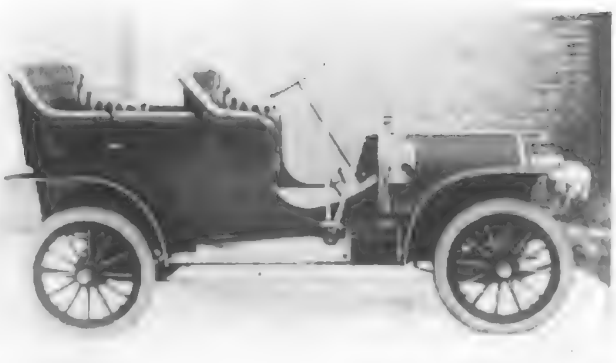
Model H Six-Cylinder Car



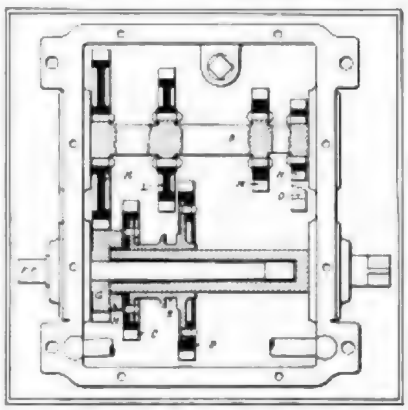
Model G Four-Cylinder Car

The 1908 Franklin Line

carrying the valves are bolted to the side of the cylinders and are cooled by circular flanges. The pipes for the auxiliary exhaust extend 7 or 8 inches from the cylinders before they unite in the pipe running to the muffler, the object being to keep the hot muffler pipe as distant as possible from the cylinders. The object of the auxiliary exhaust openings consists in that the hot explosion gases which are directed downwards by the explosion reach the openings in the bottom of the cylinders and are blown out without having to ascend to the top of the cylinder, heating the cylinder walls and then passing out through the main exhaust valves. On the camshaft all cams are keyed in place and the shaft revolves on babbitted bearings. On the front end of it is the commutator pressed on in place and dispensing with the use of driving gears. On the dash is carried a standard coil to which current is furnished by batteries. The spark control lever is on a quadrant on the steering wheel. On the top of the steering column is a flat spiral thread around which is a sleeve to which the quadrant lever is attached. As the lever is moved from side to side the spiral raises or lowers the sleeve, which is connected by rod and bell crank with the commutator casing.

The multiple disk clutch is placed within the flywheel and is sufficiently small in diameter to allow of the flywheel spokes outside of it acting as fan blades for drawing the hot gases from around the motor. Eighteen disks are used for giving friction surface. They are arranged in two sets of nine each, one set being secured at their outer edges by keys to the flywheel, and the other set, alternated with them, fastened at their centers to a sleeve on the transmission shaft. One set of disks is made from phosphor bronze and the other from crucible steel. As the clutch works in oil there is always a film of oil between the disks before they are pressed against one another in engagement when the oil is gradually expelled and the clutch takes hold gently. The engagement is effected by a clutch pedal and springs, the latter for contacting the disks. With the releasing of the springs there is nothing to hinder the disks separating. The disks are 6¾ inches in diameter and 1-16-inch thick.

The sliding gear transmission, a departure in Franklin construction, is carried in a compact aluminum casing bolted at the front and rear to two cross angle pieces of the frame. The main and counter shafts of the gearing are in the same horizontal plane with the former for direct drive, forming an axially connection between the clutch shaft and the cardan shaft to the rear axle. The counter shaft lies to the right of the main one. The entire gear case is open on top, eight screws being used in retaining the cover. The bearings, Hess Bright balls, support both shafts and are not carried between the gear case and the cover, but in cages bolted into openings in the ends of the case. The clutch shaft F has rigid with it the gear G, which carries dental face teeth H to mesh with similar teeth on the forward side of the gear C, which, being on the squared main shaft, which is coupled to the cardan shaft, gives direct drive. The pair of sliding gears C and D is slid by a yoke engaging with the collar E. The gears K, L, M and N are rigid with the counter shaft B revolving when it does and vice versa. Gear K is always in mesh with G, so that the counter shaft revolves on direct drive. For slow speed ahead the drive is through G, eighteen teeth, to K, thirty-three teeth, and from M, eighteen teeth, to D with thirty-three teeth, and to the rear axle, thus giving a heavy reduction. In the second speed ahead gears C and L are meshed, the latter has twenty-six teeth and the former twenty-five. For the reverse D meshes with O on a shaft in the bottom of the case, the reverse being due to O being constantly in mesh with a gear N of the same size on the counter shaft. It can be noticed from the illustration that in direct drive the pair of sliding gears is on the front of the main shaft; for second speed ahead they are moved back one space, for slow speed they are moved backward one space further and an additional space for the reverse. This obviates passing through gears when increasing or decreasing speed gradually, but should an operator wish to drop at once from direct drive to the reverse, two gears have to be passed through. The change of speeds is through a single lever at the right of the driver. Notches for each speed and the neutral position are on the quadrant within which the lever works. The gear shifting mechanism consists of a horizontal bar at the left of the case on which is a sleeve. To the center of it is pivoted one end of a short lever that in its middle is pivoted to the yoke engaging the collar on the sliding gears. The other end of the lever is pivoted to a lever extending across the top of the gear case over the main and counter shaft and the outer end of the lever is directly connected with the shaft carrying the speed change lever. The cardan shaft to the center of the rear axle is squared throughout its length and carries universal and sliding joints.



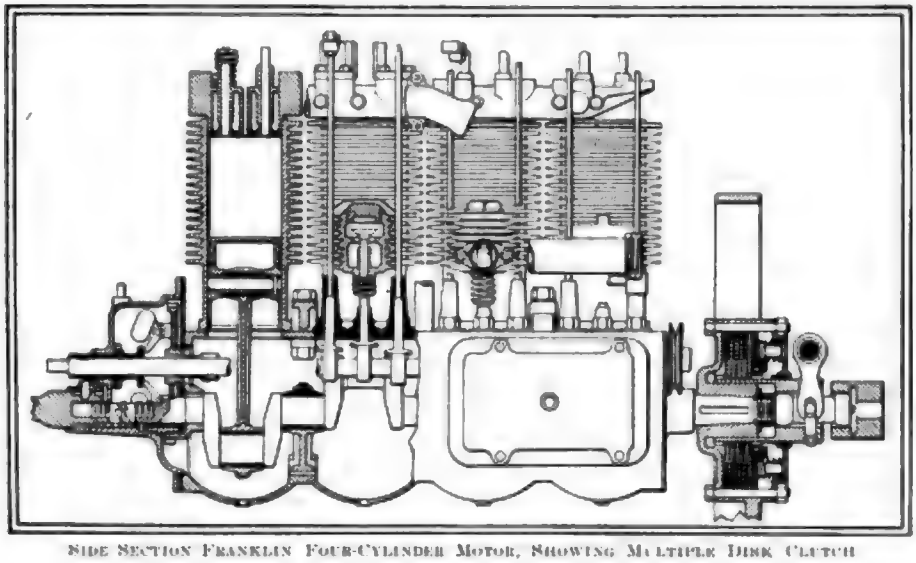
New Franklin Transmission

Three brakes are used, two of which are contraction bands on the rear hubs for emergency use. They are 8½ inches in diameter, 2¾ inches wide, and lever applied. The regularly operated brake is a friction band operating on a 6-inch drum on the propeller shaft just at the rear of the transmission gear case. It is applied by pedal.

The body is conspicuous by a cylindrical bonnet terminating in a screen front, and has straigh dash, angular side entrances and running side board. The front seats are divided by a low divider and the upholstering in front and rear seats is rolled heavily around the tops. The side entrance doors are hinged at the front side. The color, as with all of the machines, is optional, light running gear and green or red being leaders.

Of the remaining models D is a 20-horsepower car, of similar lines to the present large touring car. The motor is constructed

Digitized by Google



SIDE SECTION FRANKLIN FOUR-CYLINDER MOTOR, SHOWING MULTIPLE DISK CLUTCH

similarly to that in model G, only larger. In the transmission is used the multiple disk clutch and sliding gears. The wheel base is 100 inches, the weight 1,800 pounds, and 32 by 3½-inch tires are used. The body has the cylindrical radiator, triangularly shaped side doors, semi-divided front seats and running side board, with the front fenders with inside enclosed to prevent mud spattering on the bonnet. Model E is the 12-horsepower light roadster with the four cylinders mounted crosswise in front and single chain drive to the rear axle. The wheel base is 81½ inches, 7½ inches longer than heretofore, and the body is correspondingly larger. The change speed lever is placed inside the car and slightly forward. Model H is the new six-cylinder machine, with 30 horsepower generated at normal crank-shaft speed. The cylinders have a 4-inch bore and stroke. The construction throughout follows the lines of model G, the motor, clutch, transmission and final drive being the same but of heavier build throughout.

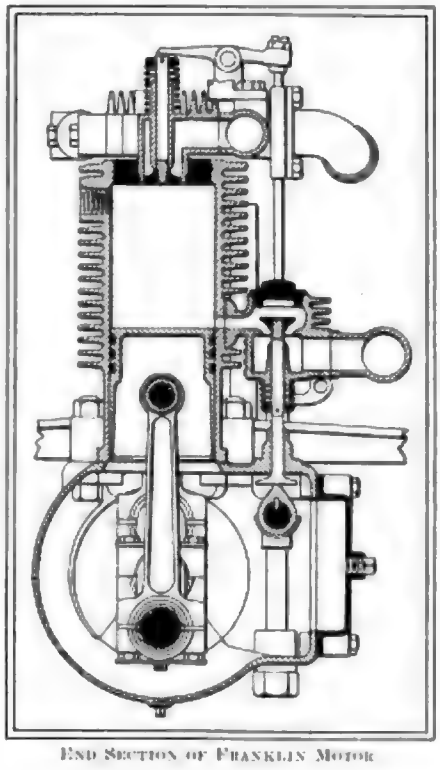
THE NEW STEARNS CAR

The F. B. Stearns Co., of Cleveland, O., has announced its 1906 model, a 40-horsepower machine. A large amount of imported material is used in the construction of the car and all material requiring strength is carefully analyzed and tested before being used; arrangements for such tests having been made with the Case School of Applied Science, a large institution located a short distance from the Stearns factory and which has complete laboratories and large testing plants.

The frame used, in the new model, is 5-inch section pressed steel, 13 feet long and trussed to give it maximum strength. The rear springs are six-leaf, 50 inches long and are guaranteed for 12,000 miles. The front springs are of the same pattern and 40 inches long. Practically the entire weight of the car is between the wheels, giving a long wheel base; 119 inches. Standard wheels are 36 by 1½-inch rear and 36 by 4-inch front, but 34 by 4½ all round is furnished optional to buyers.

The four cylinders are cast in pairs, with water jackets surrounding heads and valves. The valves are of large diameter and placed in pockets brought out to give sufficient space. Cylinder fit is obtained by a process of lapping the cylinders and pistons with crocus after they have been ground. In this process the cylinders are revolved as well as the pistons.

Ignition is by means of a positively driven high-tension magneto operated through gear from the cam shaft, but a high-tension coil is furnished where specified. The carbureter is of the two-part float type. A lever on the steering wheel operates a throttle on the intake and at the same time opens a butterfly air valve at the side of the air chamber, the two being set for a fixed relation to each other when the car is shipped. There is a fixed



END SECTION OF FRANKLIN MOTOR

air opening below the chamber and a third supply of air is obtained through an automatic inlet at one side, which operates as the suction increases. There is a main gasoline tank having a capacity of 28 gallons at the rear of the car and pressure in this is maintained by a pipe from the exhaust. This pipe contains a device for filtering and removing dampness from the exhaust, and there is a pressure regulator which, within certain limits, will regulate the pressure in the tanks. Gasoline is fed to a 2-quart auxiliary tank on the inner surface of the dash. This tank is provided with a float which gives a constant gravity feed of gasoline in the carbureter. Gasoline enters the carbureter at the top and sprays over the needle valve, thus keeping it clean at all times.

A large tank, for lubricant, is placed at the right side of the frame, accessible from the floor of the front seat. Pressure in this is maintained by a pipe to the bottom of the tank from the water circulating system. This scheme of supplying oil pressure has been used by the Stearns company for several years. Oil is forced to six sight-feed lubricators on the dash. A little refinement in this system is that each copper tube is provided with a goose neck connection to the lubricator, so that by removing a couple of nuts, any of the leads may be removed, for cleaning and repairs, without interfering with the others. The motor and transmission bearings are lubricated by this system; other bearings either running in oil or supplied with grease cups.

The radiator, built by the Mayo Radiator Co., is built up of leaf copper and bolted to a cross member on the main frame. Surrounding it, but not touching at any point, is an aluminum housing, to which are attached the bonnet covers. By this means the radiator is not subjected to the strains which fall on the front of the car, and, it is claimed, that it will not rattle apart under severe usage. It is also protected against blows which usually break the radiator when the front of the car strikes an obstruction. Directly beneath it is a direct gear-driven centrifugal pump. By removing a cap below the radiator, this pump can be removed without touching the gearing or disconnecting any other parts. There is no other water tank, the circulating system being confined to the pump, pipes, jackets and radiator, having a capacity of about 8 gallons. A belt-driven fan, of large diameter, assists in the cooling, and an auxiliary fan is formed by the spokes of the flywheel.

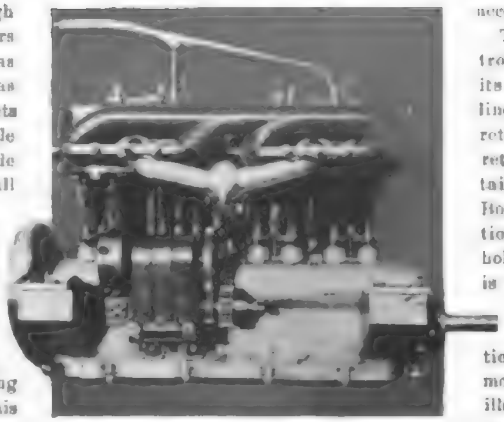
The transmission is placed well back in the frame. It is an aluminum case, accessible from the floor of the tonneau and the gears run in oil. The transmission is of the selective system, it being possible to pass directly from any speed to any other without passing through gears, and but one lever is used.

There are four speeds forward and

Digitized by Google

verse with the drive direct on the high speed. On any of the intermediate gears the secondary shaft operates but half as fast as the main shaft, instead of twice as fast, as in many transmissions. Two sets of the gear wheels are formed from single pieces to secure extra strength and wide surface in the hubs. Gear wheels are all No. 5 pitch, giving wide teeth, and they are made of Carpenter gear steel formed in Fellows shapers and tempered after they are formed. All bearings in the transmission axles and shaft are mounted on Hess-Bright imported ball bearings, which are of the two-point type and provided with oil retaining separators. A large bearing, of this type, is used on the shaft to take up end thrust. The shaft and rear axle are of Crome nickel steel tested to a tensile strength of 120,000 pounds per square inch. Heavy roller chains, at the sides, transmit the power to the rear wheels. The sprockets are covered so that they cannot be seen from the sides of the car.

There are two internal expanding brakes on the rear wheels, with an emergency brake having a 3-inch face on the transmission. The body is of cast aluminum with roomy tonneau and divided front seats. The finish is rich and the upholstering luxurious. The dash and floor plates are of aluminum, the latter having pebble tread.



STEARNS MOTOR, SHOWING MAGNETO

STEARNS SPEED CHANGE GEAR

MOTOR CAR LITERATURE

The Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., has a 100-page book filled with commendation letters from owners of its machines.

Graphite, for October, contains an article on testing a steam plant, one on the use of graphite for rifles and another on the German automatic graphite cylinder lubricator.

Cooke & Hoffman, 394 Wabash avenue, Chicago, are mailing literature on the nonthrust clutch, sliding gear transmission and opposed Phelps motor. Two views of the combination and a detailed description are given.

La Petite, model A, manufactured by the Detroit Automobile Co., of Detroit, Mich., is described in a small catalogue published by the manufacturer. The only illustrations are a front and a side view of the car.

The Cincinnati Milling Machine Co., of Cincinnati, has a large catalogue in which all of its milling machines are shown in full-page views and the parts shown in smaller line drawings. Measurements of all parts of each machine are given.

The Winton Motor Carriage Co., of Cleveland, O., has in circulation a small advance booklet on its new model K. Illustrations are not used, but fourteen pages are filled with the new features of the machine.

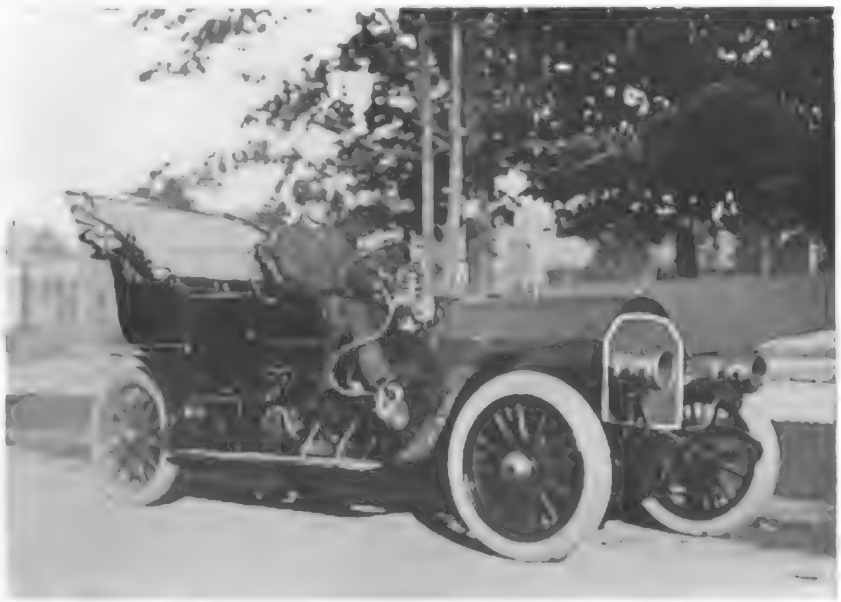
Everything in the motor car accessory line is shown in the present catalogue of the Automobile Equipment Co., of Detroit, Mich. The line includes chain boots, rain aprons, tops, brass trimmings, tires, lamps, carbureters, spark plugs, batteries, igniters, mufflers, tire casings, horns, tire pumps and other parts.

The Electric Appliance Co., of Chicago, is distributing samples of its paranite ignition cable for gasoline engines, samples of high and low tension wire being included. In addition it is mailing a catalogue of electric appliances, in which such parts as dry cells, spark coils, plugs, ammeters, switches, connections and pliers are included. Practically everything in the accessory line is included in the catalogue.

The Detroit Auto Specialty Co., of Detroit, Mich., has just issued a booklet on its radiators and bonnets. In the former line are shown the flat tube, honeycomb, return coil with water tank attached and return coil with independent tank. Details of the construction of each are given. Bonnet styles include the collapsible, stationary, and those hinged at the front. A hollow metal dash, suitable for large cars, is also shown.

The Davis Mfg. Co., of Milwaukee, Wis., manufacturer of hardwood specialties, has a two-cylinder, opposed, horizontal motor for automobile purposes, which is illustrated and described in the latest catalogue of the company. The company also shows a steel bin for containing automobile parts, which would be useful in the parts department of a big factory. The bin contains fourteen concave shelves, each shelf being divided into eight separate compartments, giving in all 118 separate, good-sized shelves.

The Scandinavian Fur & Leather Co., of New York city, has issued one of the best catalogues yet circulated on automobile wearing apparel. The clothing illustrated is suitable for motoring, motor boating and hunting. Leather chauffeur suits come first, followed by chauffeur cloth suits, overcoats, storm coats and rain coats. In the fur department are shown all styles of full length coats as well as combination coat and trouser suits. Over a dozen designs of hats and caps are shown, as are complete displays of lap-robes, boots, gauntlets, gloves and goggles. In the women's department are given all varieties of leather coats and skirts, cloth suits, plain rubber and satin-gum rain coats, dust coats in numerous styles, fur lines of many styles, head gears and goggles and veils, for summer and winter use.



THE 1906 STEARNS TOURING CAR AS IT APPEARS ON THE ROAD

Digitized by Google

Among Makers and Dealers.

PIERCE COMPANY'S AGENTS GATHER IN BUFFALO

Schebler in England—George Neil, 38 Fenchurch street, London, has been appointed English agent for the Schebler carbureter.

Barnes Now Secretary—Claire L. Barnes has been elected secretary of the Detroit Steel Products Co., He will also continue to act as manager of sales.

New Wayne Sales Agent—Jesse Draper, formerly of Peterson & Draper, has been named general sales agent for the Wayne car, made at Detroit, Mich.

Kingsley Changes—C. A. Kingsley, who has been identified with the Locomobile company for the past 3 years, will join the forces of C. S. Henshaw, the Thomas Flyer representative in Boston, next month.

Ohio Dealers Cleaned Up—Toledo automobile agencies report having sold about 300 new machines this season. One agent has a lone Waverley electric on his hands, but this is as good as sold, so the 1905 stock of automobiles in Toledo may be considered as fully cleaned up. About twenty different makes were handled by the different agencies.

Ford Branch for Buffalo—That the Ford is to be handled in Buffalo from a branch store is a certainty. The Ford company has leased the store in the Rich building on Main street next to the store just opened by the Continental tire people. The time for the opening of the Ford's Buffalo branch has not been set, but it is reported in automobile row that it will be very soon.

Reo's 1906 Output—R. M. Owen, sales manager of the Reo Motor Car Co., returned to New York last Saturday, having completed a western trip of 3 weeks, which had mainly to do with the establishment of Reo agencies for 1906 and extended as far west as Omaha, Neb. Mr. Owen says that ground has been broken for an addition to the factory at Lansing, Mich., which is expected to increase the capacity of the plant to at least twenty cars a day, and estimates the 1906 output of the Reo at 4,000 machines of various types.

A Thomas Rally—A meeting of all the Thomas agents will be held in Buffalo at the factory this month to inspect the new models and exchange plans for 1906.

Cramer Changes Cars—J. A. Cramer, of Buffalo, who loses the Ford agency through the establishment of a Ford branch in that city, has signed contracts for the Marion and Premier for 1906. He may take other lines also.

Big Lot of Tires—One hundred sets of tires make an imposing array when piled up on the dock of the steamboat company, ready for shipment to America. The Continental Caoutchouc Co., of Hanover, Germany, recently sent a big consignment to its representative in the United States, the company of which Emil Grossman is the presiding genius.

Pike's Peak Roads Poor—R. E. Olds, president of the Reo Motor Car Co., with the idea of entering a 16-horsepower Reo in the Pike's peak hill-climb, recently visited Denver. An examination of the course, he declares, convinced him that it would have been quixotic for any car to undertake the climb, the roads being in an unsafe and impassable condition.

Pierce Agents Photographed—During the recent visit of the Pierce agents at Buffalo, when they talked over 1906 business, a photograph was taken of the men who sell the Pierce. Some of them lined up in front of the Albright art gallery in Delaware park and the camera caught them in this order, reading from left to right: Charles Sheppy, the Pierce company's experimental man; W. H. Ellis, salesman in the eastern Pierce territory; J. H. Jerome, of the Harrolds Motor Car Co., of New York; R. W. Slusser, sales manager of the Harrolds Motor Car Co.; J. W. McGuire, Boston agent; H. Paulman, Chicago agent; F. B. Bower, president of the Enterprise Oil & Supply Co., Buffalo, N. Y., and th three demonstrators used by the Pier company in making tests.

Gets Pierce Contract—The Autocoil C of Jersey City, N. J., has been award the contract to furnish all the igniti apparatus for the Pierce cars for 1906.

Hawley Switches—George E. Hawl formerly associated with the Auto Equ ment Co., of Detroit, is now secretary a general manager of the Gray Mfg. (67 Larned street, Detroit.

Moves To Union City, Ind.—The T Electric Co., manufacturer of automob and gas engine specialties, has remo its plant from South Bend, Ind., to Un City, same state, where it has secu larger quarters in the building form occupied by the Union Automobile which has removed to Anderson, Ind.

New Gear Company—The Barnes G Co. has been incorporated at Oswego, Y., to manufacture steering gears other automobile parts. The capita $50,000, divided into 500 shares of $ each. The incorporators of the comp are Charles O. Barnes, Marcia Bar Thomas Moore, Charles A. Bentley Fred V. Murdock, all of Oswego. Barnes holds the patent of a stee gear which will be manufactured by new company.

After a Boat Line—The Toledo M Car Co., of Toledo, O., is contempla putting in a line of gasoline motor p boats next spring. The concern is loo for new quarters, hoping to have a b ing erected by early spring which be double the size of the Madison av garage. In the event of the concern's cess in finding a suitable location, a sp section will be allotted and espec equipped for motor boats, another for tric vehicles, and another for gasoline

Winton Car In Buffalo—Great int was shown by Buffalo motoring enthu in the exhibit in the special car o Winton company, which reached that on Wednesday morning of last week remained until Thursday night. The taur Motor Co.'s staff kept a cor string of people going to the car as it in the railroad yards. The Centaur pany has taken the Winton agency from the Jaynes company, which ha viously taken the Packard away fro Centaur people.

Temple Makes a Change—Ralph T. for the past 2 years representin Franklin in Chicago, announced this that he had given up the agency fo car and that for next year he would his leader the Panhard, which he w port directly from France. He ha taken on the Reo, which heretofo been handled in Chicago throu agency, the Reo Automobile Co. A line, the Premier, will represen air-cooling line. The Temple st located at 310 Michigan avenu an innovation will be the remov

Digitized by Google

the repair department to an adjacent building, so the big floor space can be devoted solely to the retailing of automobiles.

More Room Wanted—Although the Whitlock Coil Pipe Co., of Hartford, Conn., has doubled its facilities and put up a new building, which gives it 35,000 feet of additional floor space, it is considering the advisability of putting up another building of the same size.

Cutting Takes the Olds—Gen. John C. Cutting, well known as the organizer of one of the prominent metropolitan agencies, who retired last winter on account of ill-health, has entered the retail field again. He has secured the New York agency of the Olds Motor Works and has organized the Oldsmobile Co., of New York. Selling headquarters have been established in a commodious and handsomely equipped store at 1653 Broadway, formerly occupied by Frank A. Sanford, the Yale agent.

Hustle at Adrian—The Adrian Steel Co., of Adrian, Mich., which makes a specialty of crucible steel castings, is running a six-hole, twenty-four-pot furnace with a capacity of from 3 to 4 tons of crucible steel castings a day and announces that it is in receipt of many orders from automobile and gas engine manufacturers. The company is incorporated at $30,000, with the following officers: G. B. M. Seager, president; E. N. Smith, treasurer, and B. M. Gardner, secretary and general manager. Many orders are at hand.

Mercedes Business—According to figures furnished the European edition of the New York Herald, C. L. Charley will have done $4,000,000 worth of business for the Mercedes when the present year closes. He says he is planning to increase this to $5,000,000 next season and has ordered 864 chassis from the Mercedes factory. Of this number he claims to have already sold all but 264, which will be handled for the Mercedes Palace in Paris. The Mercedes Co., of New York, is said to have ordered 175 of the 864; the Du Cros Mercedes, Limited, of London, 215; Mercedes Palace, Florence, Italy, 50; Paris agency B, Charles Wenzel, 50, and Paris agency C, E. Lamberjack, 40.

Quick Tire Change—The four men sent abroad by E. D. Winans, importer of Michelin tires, to learn the trick of quick tire removal and replacement, for employment in the Vanderbilt race, gave an exhibition last week at the Fiat garage, New York. The crew numbered three men to a wheel, and in the first trial they put on a new shoe and tire in 4 minutes 15 seconds, while in their second trial they reduced this time to 2 minutes 42 seconds. To remove the tire of a racing car, one man sticks a knife right through the shoe and inner tube to let out the air, while the other two men rip it off. A new shoe, with the inner tube partially inflated, lies close at hand, and while two men push and jam it in place the third man hands them the tools. Patent racing lugs are quickly snapped on, and by the time the security bolts are fastened the tube is blown up ready for use.

Synnestvedt Increases—The capital stock of the Synnestvedt Machine Co., manufacturers of commercial and touring cars, has been increased from $50,000 to $100,000.

Trade Warned—The Automobile Cover & Top Mfg. Co., of New York, issues a letter cautioning the trade against the use upon automobiles of horns of the character of its Gabriel horn, threatening to prosecute all violations of its rights.

Another New York Garage—The Palace automobile garage was formally opened this week at One Hundred and Twenty-fourth street near Seventh avenue, New York. It is a two-story and basement building 50 by 100 feet. Edgar M. Houpt is president of the company.

Bob Garden in New York—The Harrolds Motor Car Co., of New York, will devote itself henceforth to the exclusive exploitation and sale of Pierce cars. Robert D. Garden, of Philadelphia, well known in Chicago in the bicycle days as Colonel Pope's western chief and later in the Quaker City as the Overman representative, has been installed as the new manager of the concern.

Mercedes Their Leader—Smith & Mabley, of New York, are to be the exclusive selling agents of Mercedes automobiles in the United States. These rights have been secured from the Mercedes Import Co., of which M. Weinburgh, the pioneer street car advertising agent and equally well known as a member of the Omega oil syndicate, is president, and E. C. De Witt is treasurer, the importing company having purchased the American rights from C. L. Charley, of Paris. Thus for the first time in the history of their importation the Mercedes cars will be handled from a single depot. This depot will be the great garage which Smith & Mabley have built at Broadway and Fifty-fifth street and which will be taken possession of this week. Under the arrangement made with M. Charley, orders may be booked in this country for delivery abroad, and vice versa.

Moore Switches—G. P. Moore, who has for 8 years been connected with the Pope Mfg. Co., of Chicago, has gone to Pittsburg as manager of the Keystone Automobile Co. He succeeds J. P. Hanna, who is superintendent of the National Fireproofing Co., and was temporarily in charge of the Keystone.

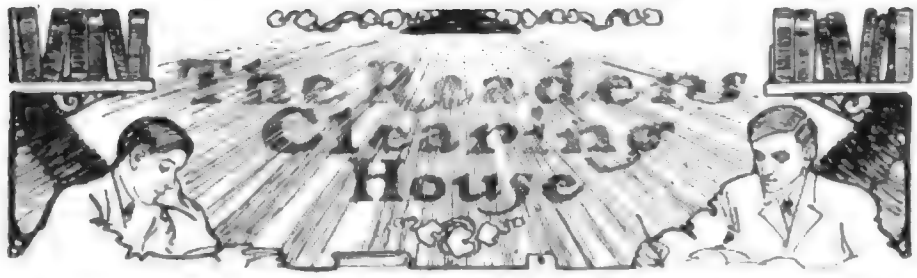
Knepper as Manager—The Frayer-Miller Motor Car Co. has been formed to act as distributing agent for the Frayer-Miller cars in New York, Connecticut and New Jersey. H. H. Knepper has been installed as manager. The company is seeking a suitable site for the establishment of its metropolitan branch. Its temporary headquarters are at 941 Eighth avenue, New York city.

Building in Providence—Such rapid progress is being made on the steel frame of the new automobile plant of the American Locomotive Co. on the westerly end of the property of the Rhode Island Locomotive Co., at Providence, R. I., that it is expected it will be ready for occupancy early in November. The three-story building will be nearly 400 feet in length and 60 feet in width when it is completed.

Takes On French Car—The Palais de l'Automobile, of New York, of which Mr. Neubauer is general manager, has secured the exclusive American agency for the Delaunay-Belleville cars, which are made at St. Denis, France. These cars were first shown at the Paris salon last year. Their makers have one of the largest factories in France, which has long been devoted to the manufacture of various parts entering into the construction of well-known French cars. The headquarters of the Delaunay-Belleville cars will be at 500 Fifth avenue.

Big Load of Continental Tires Ready for Shipment to America

Digitized by Google



BALANCING A MOTOR

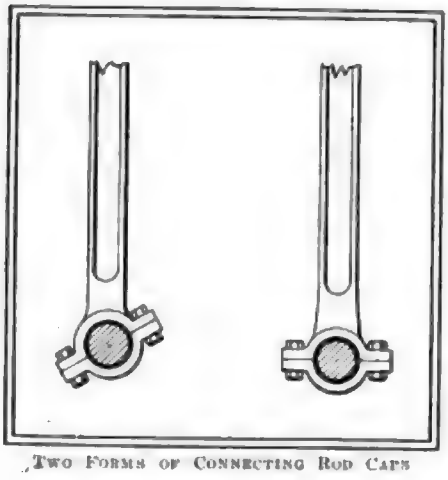
Bruin, Pa.—Editor MOTOR AGE—Will you please give, through the Readers' Clearing House, the best way to balance a crankshaft of a two-cylinder motor when the throws are together? Do you put counterbalance on crankshaft so the crank will just balance or do you use enough balance to offset the weight of the connecting rods?—E. D.

It is impossible to absolutely balance a reciprocating motor by rotating weights. The weights are usually applied to the crankshaft webs. On each web should be a weight, determined as follows: Multiply twice the weight of a crank web by half the crank throw in inches. Add to this the crank throw in inches, multiplied by the sum of the crank pin weight, five-eighths of the connecting rod weight, one-half the piston and pin weights. Divide the total by the distance in inches from the center of gravity of the counterbalance to the crankshaft. The result will be the weight of each counterbalance.

CONNECTING ROD CAPS

Syracuse, N. Y.—Editor MOTOR AGE—In the connecting rods used in some gasoline motors the cap at the crankshaft end is fitted obliquely to the end of the rod, as shown in the illustration, while in others it is attached horizontally. Is there any advantage in the former method of attaching the cap? What value is there in having the cap hinged at one side and secured at the other side by a bolt and not held by cotter pins?—J. C.

The proper use of the rod with an oblique split is when the design of the motor crank case renders the nuts more accessible, as for instance in the Winton type. Where these nuts are gotten at through a plate on the bottom of the case the split should be horizontal. A point not well taken, that has been brought up in favor of the oblique rod, is that in this case there is less thrust on the split and that the strain on the studs is more direct. A rod cap hinged at one end does not seem good practice, if the rod end bushing needs to be taken up.



TWO FORMS OF CONNECTING ROD CAPS

MANY QUESTIONS ANSWERED

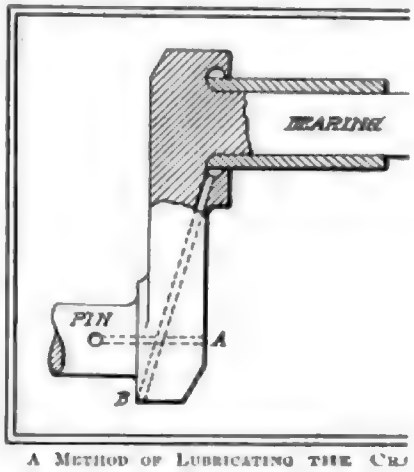
Stillwater, Minn.—Editor MOTOR AGE—Has any method of lubricating the cranks and other bearings in the crank-case proved more satisfactory than the splash system? I have started a design for a launch searchlight. I intend to have the dynamo generate currents at 80 volts, with a capacity of 1½ kilowatts. The searchlight will consume about 10 amperes; there will be two 16-candlepower lamps for lighting purposes and three colored lamps for side and tail lights. I also intend to have two sets of storage batteries of about 6 volts each. Would it be practical to use the three colored lamps as a resistance for charging the storage batteries from the 80-volt dynamo? What percentage of their rated candlepower would the lamps burn? I intended connecting the three lamps in parallel and then in series with one set of the batteries. With a good reflector do you think the searchlight will be strong enough for all purposes? Many people think that when a dry battery is once exhausted it is worthless. They are mistaken, for they can be recharged two or three times. To recharge dry batteries drill six or eight small holes in the bottom of a cell. Then get some jars or dishes that are about 1 inch larger in diameter and two-thirds as high as the cell. Dissolve ½ ounce of powdered salammoniac in the water so as to fill the jar. Then connect four cells of gravity battery in series and put the cells to be recharged in parallel with them and allow to remain over night. Wrap some sticky tape around the cell to cover the holes, and the cell is as good as new. Which is best, a two or three-blade propeller for a boat about 35 feet long with a 20-horsepower engine running at 900 revolutions and about what diameter and pitch should it be.—HARRY J. FORSYTH.

With the splash system a great deal of oil works into the cylinder and fouls the plugs. One maker uses oil in the crank case but not enough for the crank to dip. A wick is attached to the connecting rod end and it does dip in the oil and feed to the pin. Several makers use a scheme which carries the oil from the adjacent bearing to the crank pin. The construction is shown in the drawing, which is self explanatory After drilling the holes are plugged at A and B. With a good reflector the searc light should give a good light, although no as good as the acetylene searchlights on th market, which are attached to a tank of com pressed acetylene. The three lamps woul not be sufficient, as it would take a lon while to charge the batteries. The rate o charge—that is, the number of amperes t send through the batteries—will depen upon the battery capacity in ampere hour The makers will give you the charging rat Assume the rate to be 5 amperes and th each 16-candlepower lamp takes ½ amper then it will require ten 16-candlepower lam or five 32-candlepower lamps to obtain t resistance. Care must be taken regardi two things in connecting. The lamps mu be on the positive side of the charging cu rent and the positive charging wire mu connect to the positive battery pole. To d termine the polarity immerse both wires water containing a little sulphuric acid. ing then close together but not touchi bubbles will form at each wire, but on much more rapidly than the other. The which shows the greatest action is the ne tive pole.

RAILWAY INSPECTION CARS

Cincinnati, O.—Editor MOTOR AGE—C you furnish me, through the column of Readers' Clearing House, the names and dresses of companies manufacturing auto biles for railroad use? When automobi are used on the railroad, what is done w the steering gear after the flanged wh are attached, and will the other parts of machine require any special adjustments would like to know where I can se flanged wheels for my car, or if it woul advisable to purchase a machine spec built for railroad use.—E. T.

When the automobile travels on a road track, as Mr. Glidden recently tou the steering gear, of course, is not used may be locked. The wheels must be fla for the purpose. The Olds Motor W and Waltham Mfg. Co. have made se inspection cars and they probably coul range to furnish you wheels. With a fla wheel there would be no necessity for other special fitting on the car ch



A METHOD OF LUBRICATING THE CR

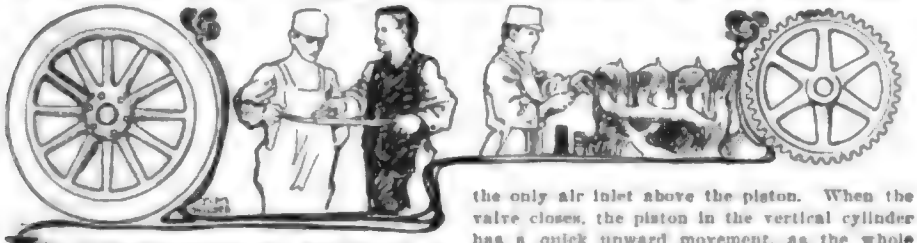
Current Automobile Patents



LETTERS patent No. 800,166, dated September 26; to Ralph L. Morgan, of Worcester, Mass.—The commercial truck of this inventor has a crane attached for assisting in unloading. The motor is placed anywhere beneath the platform of the car. Beneath the carrying platform is a cross shaft driven from the motor and on one end of this shaft, outside of the truck frame, is a capstan. The latter operates a jib-crane fastened to the side of the frame and which will swing over the load carried on the truck so that any of it can be removed and deposited on platforms either higher or lower than the truck. The boiler furnishing steam for the engine is carried on the front end of the truck. The same inventor has another device for attachment to his truck for aiding in unloading. It frequently happens that the platform of the truck is not on a level with the platform to which the goods carried have to be unloaded onto. To overcome this the truck is given a double bottom, the top one is pivoted to the upper ends of four short arms, one at either corner and the bottom of the arms are pivoted to the bottom platform. When the platforms are touching, these arms are resting at an angle. The front end of the top platform is connected to a piston working in a large horizontal cylinder beneath the driver's seat. Should the top platform be required to be raised to the level of the unloading platform, steam is permitted to enter the piston and the top platform is drawn forward, which movement raises it. In this manner it can be raised to any desired level.

Letters patent No. 800,614, dated September 26; to James R. Hubbard of Chicago—The invention relates a method of controlling the speed of a gasoline motor by restricting the opening of the automatic inlet valve. The illustration shows a horizontal motor with the inlet valve in the center of the head and the valve stem in a long cylindrical chamber. The end of the valve stem is connected through a lever and bell crank with a vertically moving piston in a vertical cylinder at the head of the chamber containing the inlet valve stem. The cylinder carrying the piston is closed at the top with a downwardly moving check valve, within which is a small opening. When the inlet valve opens it tends to draw down the piston in the vertical cylinder, which movement is restricted by the slow entry of air above the piston owing to the small opening, being the only air inlet above the piston. When the valve closes, the piston in the vertical cylinder has a quick upward movement, as the whole top of the piston, being a lifting valve, opens, allowing a quick closing of the valve. The small opening in the top of the piston for admitting air on the down stroke of the piston can be increased or diminished according to the needs of the motor.

Letters patent No. 800,497, dated September 26; to Stanley W. Shaw, of Galesburg, Kan.—The invention relates to the construction of the crankshaft of a gasoline motor, so that an enclosed flywheel can be used. The crankshaft has a single throw, being intended for a single cylinder motor. At either side of the crank pin is a large metal disk, with which the pin is integral, and the crankshaft is also integral. To the outer side of each disk is bolted a separate flywheel, which works within the crank case. The connecting rod has room to work on the crank pin between the disks.

Letters patent No. 800,337, dated September 26; to Floyd Burnham, of Fresno, Cal.—The inventor's tire for automobile wheels consists of two tubes, an outer one serving as a casing and an inner tube in which is constained an endless rope made out of hemp or other material. The object of the inner tube is to keep moisture away from the rope and thereby preserve its life.

Letters patent No. 800,308, dated September 26; to Albert De Laski, Peter D. Throop and Henry Deck, of Trenton, N. Y.—The clincher tire described has lips of rubber similar to the ordinary tires, but on the inner sides of the lips are facing grooves, in which lies a band or ring of soft rubber for holding the lips in the rim hooks. The soft rubber ring is in turn retained in position by a ring of harder rubber, which is held in position by the inflation of the tire.

Letters patent No. 800,281, dated September 26; to William Esch, of Chicago—The inventors' device is an automobile ice harvester, with a rotating cutter driven from the motor of the machine. The frame of the machine is rectangular, like the ordinary automobile frame, with the rear wheels used for propelling and the front wheels for steering. The cutter is driven by chain from the differential jack shaft. The steering wheels carry a central ridge on the tread to increase adhesion and on the rear wheels are metal disks for engaging with the ice for driving.

Letters patent No. 800,418, dated September 26; to Richard Varley, of Englewood, N. J.—The device is for controlling the spark and throttle of a gasoline engine. The circuit is opened by one mechanism and closed by another, both of which can be worked at any time in relation to each other or simultaneously. Arrangements are also included to throttle the explosive mixture to the motors at the opening or closing of the circuit. By shifting both the closing and opening mechanism the cycle of the engine can be altered.

Letters patent No. 800,269, dated September 26; to Thomas P. Corbey, of Columbus, O.—The device is for aiding in the removal of cushion tires. It consists of a lever, of bell-crank shape, with one arm serving as a handle and the other a tire engaging arm. Pivoted to the angle of the lever is a hook arm for engaging the vehicle wheel.

Letters patent No. 800,372, dated September 26; to Andrew J. Haskell, of West Bethel, Me.—The invention is a spark-igniter—starting mechanism for gasoline engines. The hammer-blow igniting mechanism is in the cylinder head and operated by a shaft paralleling the cylinder bore and carried on the side of the cylinder. On this shaft is a cam that works the inlet valve and is connected with the igniting device. This cam carries the igniting device until a certain instant, when it is released, permitting the spark to occur.

Letters patent No. 800,572, dated September 26; to William B. Hayden, of New York, N. Y.—The inventor has a mechanism for preventing the backward movement of the rear wheel of an automobile when ascending a hill and in making a stop when the brakes refuse to hold. Fixed to the wheel is a circular band, similar to the inside of a brake drum. In this band is a groove. On the axle is a spring-operated toggle that engages in the groove of the band. The toggle has a tooth which holds on the band and prevents back rotation but does not hinder a forward movement. The device is operatd by a pedal, and when not applied does not interfere with the reversing of the machine.

Letters patent No. 800,570, dated September 26; to James Hartness, of Springfield, Vt.—The inventor has what he terms a compensating bearing for road wheels of vehicles or other revolving parts. The shaft tapers but the journal does not. Between the journal and the shaft is inserted a tapered bushing.

From the Four Winds

SEEKING ROAD INFORMATION—AN EVERY DAY OCCURRENCE IN THE COUNTRY

Near the Mound City—Pretty bits of country roads are numerous around St. Louis. A motoring party in a St. Louis car recently investigated these picturesque highways with a camera, several fine views rewarding them for their trouble.

Some Farmers Progressive—Farmers who are not motorphobists are being discovered every day. In fact some of them are modern enough to attempt to educate their horses to recognize the automobile as an established institution and is willing to give out road information to the motoring touring party, while he shows the horse there is nothing to be afraid of in his greatest rival—the modern automobile.

Whoa, Dobbin!—The Automobile Association of Center County, Pennsylvania, has been organized with the following officers: President, George C. Watson, State college; vice-president, A. C. Mingle, Bellefonte; secretary and treasurer, Robert F. Hunter, Bellefonte. Executive committee, George C. Watson and C. D. Fehr, State college; John Porter, Lyon, and Robert F. Hunter, Bellefonte. The purpose of the association is not to antagonize horse owners but to promote the benefits of horse owners mutually with that of automobilists.

Latest in Furs—London furriers have gotten out their fall styles for motoring women. As seen in the cut on the next page, the woman in the car is wearing a coat of woolly cream serge, semi-fitting at the back, though loose in the front, with large sleeves widening at the cuff, which turn back and are fastened with a large pearl button. The lining is of squirrel, the sleeves being of the same fur, with wind cuff. The other coat is of Russian pony skin, the back piece being made from a single skin, with the natural dark line of the animal's back running down the center. Squirrel also composes the lining and a deep beaver collar and wide cuffs give it a wintry touch.

Dig Up Hatchet—The automobile war is in full operation again in Grand Rapids, Mich., the flying squadron of the police department having started the ball rolling by arresting four automobile drivers. Although the motorists have made no sign as to what their course will be, it is intimated that there will be something doing in a short time. There are several automobile cases awaiting trial in the circuit court, these having been appealed from the police court.

Quakers Wideawake—The Automobile Club of Philadelphia's tours and runs committee, which has charge of the preliminaries of the hill-climbing contest and the annual cross-country run, is actively at work on the details of those events, both of which will be pulled off some time this month. The cross-country run, which will be for the H. Bartol Brazier cup, will this year be over a four-cornered course totaling about 100 miles, and from the number of entries already received will far exceed in importance those of former years. The hill-climb will probably be held on Chestnut hill, from the Missahickon creek bridge to the railroad station on Main street. Other courses are being considered, but as Chestnut hill possesses the necessary qualifications for such a test it will probably be selected.

FRENCH PRESIDENT TRIES MOTORING

Out of the Ordinary—An unusual i dent occurred to B. J. Wenebel, a Pitts chauffeur, the other day. His autom collided with a fire plug, broke it off an street for two squares was flooded fo hour before the damage could be repa

Loubet's Debut—President Loubet France, made his first public appear as a motorist at the recent army m vers when he reviewed the soldiers from rear seat of his new C. G. V. autom Many of the generals of the French followed suit and motor cars were as as bears around a bee hive.

Graphic Trophy Race Off—A heav accompanied by a rain prevented the ning of the Graphic trophy contest o Isle of Man, billed for the day foll England's big Tourist trophy race. T cars had been nominated and the c was to have been over a 5-mile c In all probability the affair will be off on some course in the United Ki other than on the Isle of Man.

Hope for Kiser—Earl Kiser nee give up hope. Michael J. Dowling, speaker of the Minnesota house of sentatives, who is shy both legs, one a the fingers of his one hand, has just an automobile from Olivia, Minn., turn, a distance of 96 miles, in 7 The car is equipped with special ap so Mr. Dowling can use his artifici to advantage.

Doing Good Work—The Minneap M. C. A. has enlarged its course struction for automobile drivers, a endeavor to teach the principles gasoline engine, as applied to the bile, in a very thorough manner. course consists of twenty-four lesso lectures and practical demonstrat complete equipment of apparatus h installed, and the most prominent bilists of the city have consented operate in the conduct of the year Walter Milnor, a recent graduate Throop Polytechnic Institute, is structor.

Prominent German Killed—Th end of Adolf Altmann, president German Motor Technical Society ar known member of the German Mo has cast a gloom over German a circles, where the deceased was high esteem not only as a clever but also as a man. Herr Altm in harness. He and a Dr. Becher commissioned by a firm to be prese experimental exhibition of a new c by Engineer Schomburg for the p reporting on its practical and c value. The exhibition took place i at Breslau. In the course of the a terrific explosion occurred. Her owner of the cellar, and the luckles were killed on the spot; Herr Alt

Digitized by Google

Engineer Balmrek of the Gasmotorfabrik Deutz survived their terrible injuries a few hours only.

Wisconsin's Strength—According to the latest returns, the state of Wisconsin has more than 1,400 automobiles registered, of which number 410 hail from Milwaukee. Racine boasts fifty-six, Oshkosh fifty-four, La Crosse forty, and Madison thirty-eight.

Slow Pay—Ordinance Officer Murray G. Livingston and City Treasurer Steel are having their own trouble in collecting the city license fee from Pittsburg motorists. They have sent repeated polite requests to pay up, and, inasmuch as the city is "out" about $3,000 yet on fees, they say their requests will be followed soon by a score or more of law suits.

Foxy Bridegroom—Attorney Charles S. Estabrook, of Syracuse, N. Y., recently outwitted some friends who intended to follow him with automobiles to the railway station after his wedding and there perform the usual rice and old shoe throwing act. Mr. Estabrook was married to Miss Marguerite Curry, the daughter of a millionaire widow, at the latter's home at Magnolia, Mass. The friends had three automobiles in which they intended to jump as soon as they saw that the bride and groom were preparing to go to the station. Mr. Estabrook bribed some of the servants and in the darkness proceeded to disgear and dismantle the automobiles. After the ceremony the bride and groom changed their apparel and stole down a ladder, jumped into their automobile and were soon speeding on their way to the station. When the jokers woke up to the fact that they had gone, they rushed for the three cars. The necessary levers were manipulated, but the machines refused to budge.

Farmers Boycott—There are several towns in Ohio where automobiles are prohibited, or seemingly so. In Fayette County it is reported that a movement is on foot to form an organization for protection against excessive speeding of automobiles on the public highways. Some of the farmers carry revolvers for the purpose of popping over drivers who won't listen or obey the wave of the hand in slowing down when meeting fractious horses or teams on the highway. Others resort to stretching barbed wire across the roadway in front of approaching automobiles. So strong are the farmers against the advent of the automobile that it is said that the business men of Washington Courthouse, the county seat town, are prohibited from buying motor cars, the farmers asserting that when the automobile comes in they, the farmers, will go out. Other towns throughout the state are likewise affected. At Benton Ridge, 10 miles west of Findlay, the same spirit prevails. Jacob Whisler, who conducts a large general store and has an extensive trade with the farmers throughout the country, was about to purchase a fine Winton touring car during the summer, but he was politely informed by the farmers in that section that if he did they would withdraw their patronage. So he didn't.

Two Smart Motoring Costumes

After Better Streets—Members of the Automobile Club of America are urged by President Dave H. Morris to report to the new committee on city streets any New York pavements in bad condition, needlessly torn up or obstructed. The new committee has promised a needed reform in this direction and the club wants it to get all the necessary information.

Unknown Pays Fine—Chief Saddington, of Ogontz, Pa., who has become the terror of ordinance-breaking automobilists along the Old York road, north of Philadelphia, had the unique experience last week of being paid a fine of $12.62 and not knowing from whom it came. A car drove up to his residence during his absence and the occupant, without a word to Mrs. Saddington, handed her the amount and whisked away without leaving his name. The chief believes the money came from one of a number of Philadelphia motorists whose car numbers were caught and who were notified to appear before him for punishment for fracturing the local speed laws.

Antipodean Hill Climb—The Automobile Club of Australia recently promoted a hill-climb which attracted fifteen competitors, divided into four classes. The Marobura hill at Coogee, near Sydney, was used, the course being about 500 yards, with the grade running from 1 to 4 and 1 to 12. There were two sharp turns. The competition for 6-horsepower cars and under was won by P. O. Sherwood, in a de Dion, in 3 minutes 14 seconds; the event for 8-horsepower cars and under went to P. Britz, in an 8-horsepower Richard-Brasier, in 2 minutes 40⅘ seconds; the third division, for 12-horsepower cars and under, to M. Maillard, in a 10-horsepower Richard Brasier, in 2 minutes 19⅗ seconds, and for the cars over 14-horsepower to O. G. S. Lane's 16-20-horsepower Martini in 1 minute 40 seconds.

To Amend Road Laws—In view of the present laws not providing for the building of new roads or the keeping in repair of those already constructed, the prosecuting attorney and the county commissioners of Lucas county, Ohio, of which Toledo is the county seat, will go before the next legislature with two bills, one providing for the building of new stone roads, the other creating a fund for the maintenance of those now constructed. It is proposed that the state pay part of the expense of constructing new roads, the county another portion, the township a third and the property owners who reside along the thoroughfare to be improved a fourth; that the farmers to be assessed according to the acreage of the farms. For repairs, it is proposed that crushed stone be placed in sufficient quantities along macadamized roads, and upon the discovery of ruts, the farmers may make repairs.

One of the Garden Spots to be Found Near St. Louis

BRIEF BUSINESS ANNOUNCEMENTS

New York—Smith & Mabley have opened their new garage at Broadway and Fifty-sixth street.

Charleston, S. C.—The Sumter Automobile Co., of Sumter, has been incorporated with a capital stock of $2,000.

Albany, N. Y.—The Gas Engine Whistle Co., of New York city, has filed articles of incorporation, with a capital stock of $10,000.

Philadelphia, Pa.—Metzger & Wells are estimating on an automobile garage to be built at 220-222 South Fortieth street for F. K. Mears.

Chillicothe, O.—A new addition to the Logan Construction Co. is in process of construction and probably will be completed about October 20.

Los Angeles, Cal.—The Pacific Pneumatic Wheel Co. has been incorporated with a capital stock of $100,000, of which $90,000 has already been subscribed.

Hastings, Neb.—In addition to the Olds, which they handle in western Nebraska, L. C. Jones & Co. have taken on the Franklin. They will also build a large garage and repair shop.

Milwaukee, Wis.—An involuntary petition in bankruptcy has been filed against the Western Auto Supply Co., 235 Virginia street, the amount of the claims filed being $559.75. No receiver was appointed.

Baltimore, Md.—A new garage is about to be built by M. Gillet Gill, at the corner of Mount Royal and Maryland avenues. Quarters for the Automobile Club of Maryland will be arranged on the second floor of the building.

Bay City, Mich.—A new automobile factory is to locate here. The work on the new buildings is to commence immediately. Seventy-five thousand dollars' capital is necessary to secure the enterprise, of which $50,000 is already in sight.

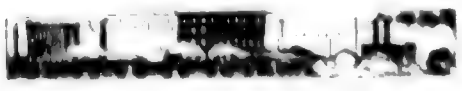
City of Mexico, Mex.—L. G. Browne has applied for a concession looking towards the establishment of a bicycle and automobile factory. The petition promises a great reduction in the price of bicycles and automobiles, providing the concession is granted.

New York—The Manufacturers' Motor Car Co. has leased a large building at 65 West Forty-third street and is installing machinery for automobile repair work. It will deal in new and second hand cars. Ralph B. Notterman is general manager and L. N. Ellis is secretary of the company.

Birmingham, Ala.—The Van Dusin Motor Car Co. will soon erect a new garage, probably on First avenue between Twentieth and Twenty-first streets. There will not be a single post in the building, the large frame being supported by the walls. It is estimated that the building will cost $10,000.

Minneapolis, Minn.—The contract to build a new garage for the Fawkes Auto Co., on Sixth street, has been awarded to J. L. Robinson. The cost is placed at $20,000. The Fawkes Auto Co. is the name by which the Minneapolis branch of the Great Western Cycle Co. is known. The company has another branch in St. Paul.

New York—A new garage is being built on the site of the old Dakota stables, at Broadway, Seventy-fifth street and Amsterdam avenue, right in the heart of the apartment section of Manhattan. Preliminary plans have been prepared by the Ansonia Garage Construction Co., the capital stock being $450,000. W. H. D. Stokes is president of the garage company.



Springfield, Ill.—The Illinois Automobile & Parts Co. has been incorporated with a capital stock of $10,000.

Columbus, O.—The American Pneumatic Wheel Co., of Lorain, has been incorporated with a capital stock of $50,000.

Pittsburg, Pa.—The Banker Bros. Co. has its new garage under roof, which will give it about as much space as it had in its old one.

Hartford, Conn.—The Palace Automobile Station has renewed its contract with the Thomas Co. and expects its first 1906 models next month.

Philadelphia, Pa.—E. C. Johnson, late of the Quaker City Automobile Co., will hereafter represent the White Sewing Machine Co. in Philadelphia.

Albany, N. Y.—The International Guayale Rubber Co., of New York city, incorporated with a capital stock of $50,000, will soon commence business here.

Springfield, Mass.—The Springfield Automobile Co. is now located in its new place, the Cooley house garage, which it believes is the largest and best equipped in New England.

New York— The Mills-Kennedy Co., which has been incorporated to deal in automobiles, has for its officers: President, Edward P. Kennedy, 91 Commercial street; clerk, A. B. White, 84 State street, Boston; treasurer, A. Ernest Mills, 57 Columbia street, Brookline, Mass.

Rome, N. Y.—A company has been incorporated for the manufacture of automobile radiators, spiral tubing and other specialties. The capital is $50,000. The name of the concern is the Long-Turney Mfg. Co., which is a branch of the Long Mfg. Co., of Chicago.

RECENT INCORPORATIONS

Oswego, N. Y.—The Barnes Gear Co. has been incorporated to manufacture steering gears and supplies for automobiles; capital, $50,000. The incorporators are Charles O. and Marcia I. Barnes, Thomas Moore, Charles A. Bentley and Fred V. Mardock, all of Oswego.

Augusta, Me.—The Gearless Transmission Co. has been incorporated to manufacture motor vehicles; capital, $500,000. Its president and treasurer is I. I. Fairbanks; clerk, L. A. Burleigh, both of Augusta.

New York—The Griswold Mfg. Co. has been incorporated to deal in automobiles; capital, $25,000. Its president and treasurer is Robert G. Griswold; clerk, R. L. Tappenden, both of Quincy, Mass.

Albany, N. Y.—The Stoddard-Dayton agency, of New York city, has been incorporated with a capital stock of $15,000 for the purpose of manufacturing and selling automobiles.

Boston, Mass.—Articles of incorporation have been filed by the Mills-Kennedy Co., which proposes to deal in automobiles. The company has a capital stock of $25,000.

Albany, N. Y.—The Hydraulic Motor Service Co. has been incorporated with a capital stock of $100,000. The company is located in New York city.

Hartford, Conn.—The Miner Garage Co. has been incorporated with a capital stock of $10,000, to deal in, store and rent automobiles.

Albany, N. Y.—The Newcomb Motor Co., of Harrison, Westchester county, has been incorporated with a capital stock of $400,000.

Springfield, Ill.—The Holyman Autom Co. has increased its capital stock $350,000 to $500,000.

Indianapolis, Ind.—The Premier Motor Co. has appointed W. Crosby, of Los A les, its agent for southern California.

Baltimore, Md.—J. L. Caldwell is to build a one-story brick garage at grove and Adams alleys. The cost wi $1,500.

Pittsburg, Pa.—The Pittsburg Motor cle Co. has absorbed the Shadyside Co. and is building a new factory on merlea street.

Philadelphia, Pa.—Plans have been by F. H. Kreisler for an addition to th tomobile garage at 220-222 South Fo street, for F. K. Mears.

St. Louis, Mo.—A. L. Dyke has orga the Auto Supply Co., with himself as ager. W. Mulford is president and T. W and E. A. Sluder stockholders.

Pittsburg, Pa.—A company has bee ganized to build a new automobile fi on Summerlea street. All kinds of au biles are to be manufactured. A bu to cost $100,000 is to be erected.

Lockport, N. Y.—The American D Steam Heating Co.'s plant has turned big automobile truck, which will carry of several tons. The truck will be u the North Tonawanda plant of the com

Toledo, O.—T. C. Whitcomb, of Clev who opened up a branch automobile a at 811 Jefferson avenue, early last has decided to quit Toledo, the agenc ing closed last Saturday. The Toled proved unsatisfactory.

New York.—A new agency will be lished to handle the Stoddard-Dayto C. H. Hill will be vice-president and g manager, and James McIlvrid is to retary and garage manager. The will open about November 1.

Dundee, Mich.—The Wolverine Auto & Commercial Vehicle Co. was recenti for the purpose of manufacturing an ing automobiles, supplies, accessorie gasoline engines. The capital stock 000, divided into 2,000 shares, the c ling interest being held by H. J. Hu Detroit. A plant will be erected at

Pittsburg, Pa.—The Hiland Automo is preparing to build an addition to rage on Beatty street, opposite th house. The new building will be 40 feet and will be double the capacity present garage, the company's storag being 35 cars. The officers are: Pr Dr. John A. Hawkins; treasurer, Dr. Uring; manager, W. A. Richwine.

Nashville, Tenn.—The Southern Aut Co., formerly capitalized at $10,000 ar ing a garage on Third avenue, has b organized and a provision made in th ter for the capitalization of the com $100,000. W. J. Cummins is presid E. E. Sweeney secretary and genera ager. The company handles the Wh dillac, Stanley, Yale and Franklin.

Middletown, Conn.—A civil action has been brought against William H president of the Simplicities Auto C interfered with the purpose to wind affairs of the concern. The Warwic & Automobile Co., of Springfield, has proceedings against Mr. Kitto to $1,000 loaned him, and the Simplicit pany, which is indebted to him, ished for the amount involved.

National Headquarters
Vanderbilt Building New York

THIS LEAGUE

Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the co-operation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

OFFICIAL STATIONS

The following appointments of official stations are announced: Willows, Cal., Willows Cyclery & Garage, 441 Tehama street, Smith & Platt, proprietors; Dayton, O., Miami Motor Car Co., 117 East Second street; Stroudsburg, Pa., Stone's Automobile Works, 1009 Main street, Clarence Stone, proprietor. All proprietors of official stations are under contract which requires them to allow a discount of 10 per cent on all bills for repairs and supplies for American Motor League members, but this discount applies only to bills of $1 and upward, and is allowed only upon presentation by the member of his unexpired membership ticket, which suggests the necessity of prompt renewals.

PROTECTION DISKS

Two stolen automobiles were reported at league headquarters last week. It is, of course, certain that these thefts will continue and increase as the use of the motor car becomes more general. The American Motor League protection disk tells its own story. It is shown by cuts on this page. It is covered with red leather and may be attached to the automobile without danger of scratching or marring the polished surface of the vehicle. The disk is supplied with a strong red silk cord which passes through a hole on the leather-covered tag, by which it may be attached to any convenient part of the car. The American Motor League will protect members from theft and from personal injury in every possible way. It offers $100 reward for the conviction of any thief who steals an automobile bearing one of these protection disks, and $25 reward for the conviction and punishment of any offender who injures the person or property of an American Motor League member while on the public roads.

$25 REWARD
WILL BE PAID BY THE
AMERICAN MOTOR LEAGUE
For the conviction of any offender who maliciously injures the person or property of a member while riding on the public road.

IN CASE OF THEFT

The league, on receiving information of the theft of any registered automobile belonging to a member, will immediately send notice and full description of stolen car to the police authorities of the various towns within a radius of several hundred miles from the place of theft with notice also of the reward offered for the conviction of the thief. The name and address of the owner of the stolen vehicle will be given, and notice will be sent to him at once in case the thief is arrested or the vehicle recovered. Similar notice will be sent to the various dealers in second-hand machines who will be thereby warned against purchase of stolen vehicles and who will also be able to identify and detain the thief who offers the stolen property for sale. Notice will also be sent to the automobile papers, and to the prominent newspapers—there being a large number of the selected list at league headquarters—and every effort will be made in each case to recover the property and convict the offender.

ASSAULT CASES

In case of assault the member whose person or property is injured should at once secure the arrest of the offender and have him taken before the nearest magistrate. If necessary counsel can be secured, or the aid of the public prosecuting attorney invoked and the criminal thus brought to punishment. The reward of $25 in such case will be paid only for the conviction which leads to the punishment.

NEW LEAGUE CLUB

The Monmouth Automobile Club, of Monmouth, Ill.—John S. Browne, president, and Alan W. Pattee, secretary—met last week and joined the American Motor League in a body. The Monmouth club will hereafter represent the league in all local work in the Monmouth district. The following members of the club have been appointed consuls: Will Bartlett, Cleo C. Duke, J. Ralph Firoved, W. H. Grooms, Morton Humphreys, William Mason, A. C. McIntosh, Roscoe McKinley, Fred B. Pattee, Dr. A. G. Patton, James Root, George A. Schussler and Fred Weir.

Other consuls have been appointed as follows: Fred H. Waldron, New Haven, Conn.; Max Siepermann, Manhattan, N. Y. C.; Dr. William Martin, Bristol, Pa.; Arthur W. Clark, Conshohocken, Pa.; George F. Armsby, Vineyard Haven, Mass.; Henry E. Knapp, Menominee, Wis.; Newton H. Davis, LaRue, O.; Charles F. Keene, Beaver, Pa.; Oliver O. Jarrard, Mauch Chunk, Pa.; J. Elmer Wood, Beverly, Mass.; A. M. Haines, Bay City, Mich.; H. P. Strasbaugh, Aberdeen, Md.; Charles B. Kennedy, Madison, S. D.; E. S. Stearns, Thomaston, Me.; Arthur C. Jackson, Philadelphia, Pa.; Thomas T. Firth, Philadelphia, Pa.; Horace Brock, Lebanon, Pa.; and Fred M. Smith, of Hibbing, Minnesota.

WINTON

Economy of Up-Keep

A $3500 car for $2500—the new Winton Model K. A **thousand** dollars saved on purchase price.

And then you save on **Up-Keep.**

Up-Keep is the price you pay for service—mileage—after you buy a car and pay for it.

Up-Keep includes the cost of Fuel, Oil, Repairs, Replacements, and Tire expenses.

All these items hit your pocket-book.

Therefore, **Up-Keep** is vitally important.

Now, let's consider Fuel and Oil.

The new Winton Model K saves fuel—

1. By the use of an economical carbureter, designed especially for the cylinder capacity, power and speed of Model K.
2. By using all the gas that enters the cylinders, and not wasting any part of it.
3. In perfect fitting bearings, which reduce friction.

Model K cylinders retain their charge over night. So, you can start the motor from the seat the next morning **without cranking.** That means you can stop your engine whenever and wherever you stop the car, thus wasting no fuel in unnecessary engine running. Also, it means that Model K cylinders are perfectly ground and **do not leak compression.** Cylinders not perfectly ground waste compression at every piston stroke, and that waste costs money—just like pouring expensive gasoline into a pail with a hole in the bottom. But Model K cylinders turn every drop of gasoline into **power** to propel the car.

But, even with perfect compression, as on Model K, your engine will waste power unless all bearings fit perfectly, are of right material, and have wide bearing surfaces. Every ill-fitting bearing means **friction.** To overcome friction the engine must use part of its power, and that power used to overcome friction can't be used to drive the car. That, too, is wasteful of money. You save all this by using a Winton Model K, for its bearings are large, perfectly smooth, and of material that shows least wear. A 50 h. p. motor with poor bearings eats more gasoline and oil and produces less traveling power than the 30 h. p. motor of the Model K.

Model K saves oil—

1. By being water-cooled.
2. By the use of the Precision Oiler.

Automobile engines are either water-cooled or oil-cooled (sometimes erroneously called air-cooled).

Water is cheap. Oil is expensive. Model K is water-cooled for that reason—for the same reason that one bathes in water and not in champagne. But, of course, there's no law against oil-cooled motors: you may use that kind if you don't care for expenses.

Then the Precision Oiler. Feeds oil to each bearing in just the exact volume needed. No waste through flooding seven bearings in order to give the eighth bearing just enough oil. Then this Oiler feeds oil in direct proportion to the speed of the motor. Thus when you run slow you are not wasting oil that the bearings do not need. Further still, this Oiler has **shot-gun force** and gets the oil to the bearings in any weather, even the coldest. Oil can't clog in the pipes. Each bearing fed separately, so that oil intended for any one bearing must reach that particular bearing. We have been studying oilers for 10 years and this Precision Oiler is the best we have ever seen. That's why Model K has it.

There are other ways in which Model K cuts down **Up-Keep** expenses. Let us tell you about them. Catalog No. 2 is ready.

WHEN YOU PAY MORE

Model 4B

$1500

for a touring car or runabout than our price, you are paying for features which you get without extra charge in the

An ideal touring car at an ideal price. 18-20 h. p. (4-cylinder vertical motor). $1,500. One h. p. for every 85 pounds of weight. *No radical features or untried devices for which you will have to pay for the experiments.*

It embodies the best features of the most famous cars, but it is different in at least one essential—price. A 4-cylinder touring car at $1,500 seems unusual, you say? It is *more* than unusual—*it's wonderful.*

MITCHELL

It is not only **"the car you ought to have at the price you ought to pay"**

Model 2B

$750

It is **more.** It is absolutely the best car—the most perfectly constructed—the most simple to operate and the most stylish in appearance on the American market. You cannot **possibly** do better than to buy a **Mitchell.**

2 cylinder, 9 h. p., vertical motor, mounted in front. This Runabout is as carefully designed, as up-to-date and smart in appearance as any three or four thousand dollar car ever built. It has amp'e power for all conditions of road and its hill climbing abilities are unsurpassed. It is *all* that *any* man may want in a Runabout.

MICHELIN

Every important race in 1904-1905 in every country in the world was won on MICHELIN TIRES.

The largest tours made all over the world have been made on MICHELIN TIRES.

Each automobile wheel equipped with MICHELIN TIRES will carry more guaranteed weight than any other pneumatic tire made in the world.

Thus in racing, touring, and carrying weight, MICHELIN TIRES have proved beyond a doubt their superiority and the facts are incontestable.

MICHELIN TIRES cost more—They wear longer.

If you keep tabs on your tire expenses for one year you will find MICHELIN TIRES 50 per cent cheaper than any other.

MICHELIN TIRES do not rim cut—MICHELIN TIRES are safer.

Insist on MICHELIN TIRES for your 1906 car.

MICHELIN round tread touring shoes.
MICHELIN flat tread racing shoes.
MICHELIN Anti-Skid (not covered with leather) shoes
and above all
Get MICHELIN Tubes Para Rubber.

Don't be deceived and allow a slick salesman to tell you their imitation is just as good.

Rating Automobiles in Terms of Horsepower

of the engine is not a satisfactory method. The term "horsepower" really means nothing. The only correct comparison is one of Ability. **The Ability of a car is measured by the amount-of-power delivered-to-the-wheels-per-100-pounds weight-of-car.**

¶When people ask us the "horsepower" of the Stevens-Duryea, we hesitate to tell them that it is 20, for the bare statement does the car a great injustice. The complete answer is that the actual weight of the Stevens-Duryea is 1650 pounds (and not a pound more)—that the engine is 3⅞ x 4½ and develops 20 H. P. at 1,200 R. P. M.—that the mechanism is so efficient tha we only lose 10 per cent of this power before delivering it to the wheels whereas the best of other cars lose at least 30 per cent, and some nearer 50 per cent.

¶We then tell them that allowing a loss of 10 per cent leaves us 18 horsepower delivered to the wheels. Dividing 1650 by 18 gives 92—that is to say, the Stevens-Duryea gets one horsepower delivered to the rear wheels for each 92 pounds weight of the car. The best that other automobiles can show is 125 to 200 pounds per horsepower.

¶The Stevens-Duryea owes its Ability to a new system of design—patented and known as the Unit Power Plant mounted on the car on Three Points.

¶Our booklet explains all.

POPE Toledo AUTOMOBILES

The NEW Type XII, 35

POPE-

PRICE, $3,500

Some advance and interesting data on the LATEST and GREATEST achievement of the WORLD'S LARGEST AUTOM PLANT.

MORE POWER, MORE SPEED, MORE ROOM, MORE STLYE, MORE STRENGTH—LESS WEIGHT.

Every one in the trade **the world over** is now familiar with the unparalleled and unapproached record of the justly renowne **Toledo.** A few months ago we could not ourselves see that it was possible to produce a better car than that with which we ha **every notable speed, endurance and hill climbing contest.** But our wide experience, new methods, new and improved machinery quantities, and **above all** the **highly successful** culmination of experiments in **specially treated steels** which have been in progress past four years, have enabled us to produce in Type XII, a **car that is a long step in advance** of our fondest wishes or expectations

Motor Four Individual, Twin Head, Cylinders, 4-cycle Copper Jacketed, developing **under brake test** 43 to 44 H. P. Water by the matchless Pope-Toledo Radiator. **All gears encased.**

In this space it is impossible for us to go into any deep exposition of the many points to be considered in producing the efficiency for the least weight in gas engine design. What **has been** accomplished in the Pope-Toledo in this respect might be stated in the claim that in this now highly efficient motor **the very remarkable result** has been attained of **SECURING ONE H. P. EVERY TEN AND EIGHT-TENTHS POUNDS OF WEIGHT,** and this, too, **without** in any sense **sacrificing** the **strength** or parts. This proportion of weight to horsepower has not been achieved by any mere laboratory test, by running the engine impractical speed, but under the ordinary conditions which prevail.

Ignition Jump Spark, Coils and Batteries. Provision made for Magneto. Control is simple, flexible and positive. The car driven **on high speed behind a team walking** or up to its maximum speed, **simply by the use of throttle and** both located on the Steering Wheel.

Control The **Pope-Toledo** Engine has been developed to such a point of efficiency that we are now able to run it from 200 to 1200 R. P. M., at which point it delivers its **greatest efficiency.** It is not only exceedingly **quiet under all con** but the use of a scientifically constructed Carbureter gives **great latitude of power** to the engine **at varying speeds.** Heretofo bureters have been generally adapted to deliver their **greatest efficiency** to the engine at a maximum speed. The Pope-Toledo Ca is developed to such a point of fineness, that it is **self-adjusting** to all conditions of speeds, so that **with the Spark and Throttl** and always **on the high gear,** you can drive a Pope-Toledo **anywhere,** taking all ordinary hills without rushing them and without gears.

Transmission Transmission is of the Sliding Gear type, three speeds forward and reverse, being **absolutely direct** the high gear with **no idle gears** in mesh. Ball bearings at all important points. The Transmission XII is **one of our great forward steps,** mentioned above. The steel we use in this transmission, of **210,000 pounds tensile s** will play a most important part in the future development of the Pope-Toledo. True, it is very **expensive to make** and sti **expensive to work.** By its use we are enabled to produce not only the **lightest,** but the **strongest** and **most efficient transmission eve in any automobile.** This steel is of the finest quality, more expensive and harder to work than any used by any maker in While it is true that some of the European makers use some very fine steels, we do not hesitate to say that the steel herein ment **superior from every standpoint** which **we have proven** to our own satisfaction by **every known test** and **by actual experience** fro it in the cars themselves **under the most severe and arduous road conditions.**

Frame All steel Frame **of few parts,** tested to a safe load away above what is required. All steel, light, flexible and stro ing the car very **easy to ride in,** and **easy on both tires** and **engine.**

Double Direct Outside Chain Drive

At this stage of automobile development, but few arguments need be advanced to show that on of efficiency, which means **reduced friction, weight** and **durability,** the chain system of power trav **AS APPLIED TO LARGE AND POWERFUL TOURING CARS,** is a long way ahead of the Cardan **from every standpoint.** We give herewith a table of exhaustive tests conducted in France in the to determine this point.

It has been thoroughly demonstrated, and **engineers are agreed,** that bevel gears are not as efficiency as Spur Gears, and that Chain Drive shows **greater efficiency, longer life,** and **less loss of power** than either Spur or Be Recent French experiments on the efficiency of Bevel gears, Spur gears and pitch chains, as applied to motor cars, **prove beyond** that **the chain drive is decidedly superior.** The results of these experiments are as follows:

	New	Worn
Roller Chain, Lubricated and exposed to dust	94%	92%
Bevel Gear, Steel on Steel, Running in Oil Bath	88%	82%
Spur Gear, Steel on Steel, Running in Oil Bath	92%	90%
Spur Gearing, Leather Pinion, Cast Iron Wheel	88%	80%
Spur Gearing, Steel Pinion and Fiber Wheel	88%	80%
Spur Gearing, Steel on Steel, greased and exposed to dust	90%	80%

Digitized by Google

I. P., "Quiet-Mile-a-Minute"

OLEDO

POPE Toledo AUTOMOBILES

LLY EQUIPPED

Chain drive is **decidedly** more **flexible** and **efficient**, requires **less care**, and on account of its flexibility, the motor and transmission and chassis are **not subjected to violent shock.** The matter of repair and replacement is **infinitesimal** as compared with bevel gears. You can tow a car with a broken chain, but you cannot do so with a broken bevel gear; and the older and more worn the gear the more power it consumes. Isn't it significant that in the elimination trials for the Gordon-Bennett Race, in which out of 70 or 80 cars the best three from each country were to qualify, that notwithstanding **over 50% of the entries were shaft driven,** out of the entire lot **only one shaft-driven car was able to qualify.** In the race **this car was not able to even make a showing** against all the chain-driven cars.

Brakes The Pope-Toledo system of Brakes is incomparable. Both foot and emergency brake act on the hubs of rear wheels, which are very efficient and easily adjusted to wear.

Gasoline Capacity 17 gallons, sufficient for 270 miles—from ⅛ to ½ more mileage for the same quantity of gasoline **than any car in the world.** Gravity feed to Carbureter.

Axles The Axles on Type XII are of the I Beam Type, FORGED IN OUR OWN PLANT of the best steel obtainable, being tested to **110,000 pounds tensile strength.**

Wheel Base 104 in.—Standard tread, 54 in.

Wheels 34 x 4, front and rear. We make all of our wheels here in our own plant. **All wheels spoked and assembled by hand.** Ball bearings of large dimensions.

Body Design Entirely new and original, along beautiful lines distinguished and distinct. Double side entrance. Very large and roomy tonneau, **especially easy of access.**

Front Seat and Tonneau **Of Mirror Finished Steel,** large and comfortable front seat divided. Deep and heavy upholstering.

Hood and Guards Improved Hood, opening from either side; Guards oval shaped, **made of aluminum,** following curve of wheels. Front guards large and flaring.

Tires We shall adopt for regular equipment **the best tire on the market,** determined by observation and our wide range of experience. Rims also of standard sizes, admitting the use of any Foreign or Domestic tire.

Equipment Full set of lamps, horn, tools, floor mats, tire pump and jack. A very complete outfit **of the highest quality.**

Proportion of Horsepower to Weight Not further back than a year ago it was considered good practice to have 100 pounds of car weight to one horsepower. How much has been accomplished not only **without the sacrifice of strength,** but by **actually increasing strength and durability,** can be best understood by stating that the new model Pope-Toledo has **ONE H. P. FOR EVERY 54 POUNDS OF WEIGHT.** It seems unnecessary to produce any arguments as to what this means. Certain it is that one of the chief points must be in durability not only to tires (which of course is a most important factor) but also to **all moving and wearing parts.** Experience and deep study of the entire subject of automobile building have demonstrated that to attempt to make a car strong by merely increasing the size and consequently the weight of the parts, not only **does not constitute strength** but is actually **a source of weakness,** for the larger and heavier car is sure to contain within its weight **the germs of its own destruction.** We have aimed therefore to keep **the horsepower up** and **the weight down** without for a moment losing sight of the importance of strength and safety.

Weight Distribution With the weight more evenly distributed in this new model than ever before, it must become evident to any one posted in the art that a great deal has been accomplished not only for the **durability of the machine** but **for the tires** themselves. The even distribution of weight and strength, aside from motor design, has probably received more careful study from us this year than ever before, and has only been possible through the wide knowledge we have gained from the thousands of our cars in use and from whose performance we have been able to apply the proper result in the increase of power and reduction of weight, with increased durability and strength.

We also build Landaulettes, Limousines, and a Gentleman's Roadster of 20 H. P., four cylinders. Special cars built to order of 20, 30, 35, 30 and 60 H. P. Further details given upon request.

25 H. P. DOUBLE SIDE ENTRANCE - -	$2,800
35 H. P. FRONT ENTRANCE - - - -	3,200
40 H. P. DOUBLE SIDE ENTRANCE - -	3,500
60 H. P. - - - - - - - - - -	6,000

And upwards according to specifications.

Three of the 1906 Models

Type G

The Big-Little Car

5-passenger Touring Car; weight, 1,300 pounds; 35 miles an hour.

$1,800

FRANKLIN

Type G, the new Big-little, Shaft-drive, Three-speed, Four-cylinder, Air-cooled, Side-door car carries 4 or 5 people over American roads more miles in a day or a year—and safer, easier and cheaper than any other car but a *Franklin*.

Small in weight, bulk and operating cost. Big in capacity and performance. A 12 "Franklin-power" engine which delivers up more actual "go" than the average car of 20 horse-power rating. Construction, material, springs and air-cooling that make all the power available on all roads all the year—summer and winter.

Costing 50 per cent more per pound to build than any other make of car and yielding 100 per cent more comfort, safety and enjoyment.

Type D. High-power Touring Car

This is another 1906 model, 20 "Franklin-power" car. It is the strongest car of its weight, and the lightest for its power. No car is more luxuriously comfortable, nor speedier on American roads.

Type E. 12 "Franklin-power" Gentleman's Roadster

As a business runabout; a superintendent's car; for a doctor or other professional man, or a suburbanite; for 2-passenger touring; or as a speedy roadster for the owner of a big touring car, there is nothing to compare with it.

It is an all-the-year-round car. No cold can freeze it. With air-cooling there's nothing to freeze. It needs no warm barn in winter, but stands always as ready as a saddled war horse, travels through snow like a plow; and when topped is perfectly comfortable in any weather.

It is the ablest, speediest, handsomest car of its type.

All three cars show a few detail improvements over our former models: Brake and clutch levers put forward—so that the driver gets in and out easily. Force-feed, wire-belt oiler on the dash. Ball-bearings on rear axle and transmission. And more effective brakes.

But not a single change or departure from the time-tried and victorious principles which make *Franklins* the coming standard American type.

"The Motor Car of the Future"

Send for book which describes all our 1906 models.

CHRISTMAS DIAMONDS ON CREDIT

THE LOFTIS SYSTEM AT CHRISTMAS TIME

is a great and timely convenience to thousands. It enables persons in all circumstances to make beautiful and appropriate **Christmas Gifts** with a very small initial cash outlay.

Everyone at Christmas time is anxious to give to their loved ones handsome Christmas Presents but it is not always convenient. The **Loftis System** of Credit, **means convenience.** Diamonds, Watches and Handsome Jewelry of all kinds for Christmas Presents on convenient terms.

You Are Welcome to Credit whether you are a moderate salaried employee or a wealthy employer. The **Loftis System** makes any honest person's credit good by adjusting terms to meet their earnings or income. Do not think that you must give a cheap, ordinary present because you can only spare a few Dollars just now. With five or ten Dollars for a first payment you can give a Wife, Sweetheart or Mother a beautiful Diamond which will last forever, enhance in value and continually bring pleasant thoughts of the giver's generosity.

Love is the Real Santa Claus. It is love which brings the joys of a Christmas remembrance and a Diamond is the most appropriate of all gifts for a wife, sweetheart, sister or mother because it is the true token of love. **It is the gift of gifts. Write today for our Big Handsome Christmas Catalogue.**

Our Christmas Catalogue for this year will be the largest and most complete we have ever issued. **Write for a copy today** and glance through the wealth of Gems, Fine Watches and miscellaneous Jewelry illustrated on its many pages. Beautiful Xmas presents for all. Diamond Rings, Brooches and Pins for Wife, Sweetheart, Sister or Mother. Diamond Studs, Scarf Pins, Fine Watches, Charms, etc. for Husband, Father, Lover or Brother

At your leisure in the privacy of your home you can select the Diamond, Watch or piece of Jewelry you prefer. Write us and we will send you any article you may select subject to examination and approval. Examine it thoroughly. You are perfectly free to purchase or not just as you please. We pay all charges. We take all risks. We deliver goods anywhere in the United States.

We invite you to open an account with us, become acquainted with the famous **Loftis System.** Remember it means convenience. Every transaction is on honor, prompt and satisfactory, one fifth the price to be paid on delivery. You retain the article, sending balance in eight equal monthly amounts direct to us.

Cash Buyers are welcome too, and we have an equally attractive offer for them, as follows. Pay cash for any Diamond, and we will give you a written agreement to take it back at any time within one year, and give you spot cash for all you paid—less ten per cent. You might for instance, wear a fifty dollar Diamond for a year, then send it back to us and get forty-five dollars, making the cost of wearing the Diamond for the entire year, less than ten cents weekly. No other house makes this offer. **Write today for Christmas Catalogue.**

Diamonds As An Investment are unexcelled. They are increasing in value every year. The Chicago Journal says in an editorial that they will advance twenty per cent in value during the coming twelve months. What other present is there so acceptable and so profitable? **Write today for Christmas Catalogue.**

The Gold Medal Highest Award which we won at the World's Fair, St. Louis.

Do Your Christmas Shopping Now. Do it conveniently and leisurely in the privacy of your own home. Don't wait until the Christmas rush is on. **Now** is the time to secure the choice selections and have ample time to inspect the goods. **Write Today for our Big Handsome Christmas Catalogue.**

A Test of Merit. In competition with the entire world at the St. Louis World's Fair last year our goods, prices, terms and methods won the **Gold Medal,** the highest award given to any exhibitor. No stronger endorsement of the **Loftis System** could be given. **Write Today for our Big Handsome Christmas Catalogue.**

Our Reliability. We refer you to your local bank, and they will consult their commercial guides Dun and Bradstreet and tell you that our responsibility and promptness are unquestioned. We give a signed guarantee as to the quality and value of every Diamond sold. Every Diamond we sell may be exchanged at full price at any time for a larger stone.

WRITE TODAY FOR OUR CHRISTMAS CATALOGUE.

Diamond

Wrapped Tread Tires

Was given by the Vanderbilt Cup Trials. Eight cars were equipped with Diamond Tires, and not a finger was touched to any Diamond Tire throughout the race.

S. H. Dingley, driver of the Pope-Toledo, first to finish said, "They are the best tires in the world. I cannot say enough of the satisfaction I have had from them."

Joseph Tracy, who drove the Locomobile finishing second, said, "My Diamond Tires gave me absolutely no trouble."

Robert Jardine, driver of the Royal, third in the Trials, said, "I cannot ask for better tires under any conditions."

Frank Nutt, the Haynes-Apperson driver, taking fourth place, said, "From start to finish I had no occasion to give my tires a thought. Their record was perfect."

THE WINTON MOTOR CARRIAGE CO.
MANUFACTURERS OF WINTON MOTOR CARS
CLEVELAND, OHIO, U. S. A.

Sept. 14, 1905.

The Steel Ball Company,
840 Austin Avenue,
Chicago, Ill.

Gentlemen:

In reply to your favor of the 12th inst., would say that Mr. Alexander Winton has always recognized lubrication as one of the most important problems to be solved by automobile builders.

It is safe to assume that the Winton Motor Carriage Company has devoted more thought and experimenting to this feature than any other automobile manufacturing company in the country.

For more than a year the Hill Precision Oiler has been subjected by Mr. Winton to the most exhaustive tests, both in our experimental department and also in exceedingly severe and prolonged road work. The most satisfactory results have been obtained, and as a result, believing it to be the most perfectly developed lubricating device yet produced, Winton cars will be equipped during the coming season with the Hill Precision Oiler.

Yours very truly,

THE WINTON MOTOR CARRIAGE CO.
Chas. D. Adams
General Sales Manager.

FRANKLIN MOTOR CAR

369-371 Commerce St.

DALLAS, TEXAS, Sept. 6, 1905.

Continental Caoutchouc Co., 43 Warren St., New York.

Gentlemen: The writer has just returned from Buffalo, N. Y., where he finished a very good transcontinental run. We started from Dallas with a set of your tires which had been in constant use for five months, but these tires carried us through to Buffalo without a single puncture, or without requiring repumping. However, notwithstanding the fact that our route carried us through the roughest part of the Indian Territory and Missouri, we were out to make time, and we spared neither the car nor the tires, and consider that the tires performed in a most remarkable manner.

On our arrival at St. Louis we were informed by your agent that he had no tires in stock which would fit our car. We hesitated about going on with the tires in the condition they were, but decided to see just how much wear they would stand, and so did not renew any of them, although we had two extra tires in our hamper. We started from St. Louis running on the fabric, and the tires carried us to Buffalo without any trouble whatever, seeming to be in as good condition when we arrived at Buffalo as they were when we left St. Louis.

We have had the car shipped back to Dallas, and upon its arrival we will send the tires to you for inspection.

The writer has driven automobiles for a long time, and has had lots of experience with different makes of tires, but this trip to Buffalo was an eye-opener, and the writer must confess that he does not believe there is a tire on the market that could have duplicated the Continental performances on this trip. We were primed for all kinds of trouble when we left Dallas, and carried extras in the way of casings and tubes and a variety of repair outfits, for which we expected to find almost daily use. Perhaps you can realize how remarkable it was to go through this long trip without having even to use the pump on any of the tires.

Assuring you of our appreciation of your skill in building tires, and thanking you for past courtesies, we beg to remain,

Yours truly,
S. H. BOREN AUTO CO.,

SATISFACTION and the OLDSMOBILE

Have you ever talked with an Oldsmobile owner? If so, you must have been impressed with the satisfaction he expressed with his machine. Users of Oldsmobiles are our best advertisers. You naturally grow to like a machine that gives you thoroughly satisfactory service, and you are glad to tell your friends about it.

At one time and another we have had a good deal to say about the Oldsmobile for doctors' use. Here's what one doctor says:

> "My runabout has attracted considerable attention. *It always goes* and I am never delayed except occasionally on account of tires. I live on the top of a high hill, and cannot go anywhere without going up and down some long, steep hills. I am out in all kinds of weather. My car is practically as good as the day I bought it and it has had hard usage. *The expense of keeping it in order has been very small.*"

We have hundreds of letters along the same line and names and other information will gladly be sent on request. If you are interested in a machine for business or family use write us for further information. By calling on our nearest agent, you can easily arrange for a demonstration, which is the most convincing argument we can present. Send for Catalog 52.

Garford Touring Car Parts

The great problem of the hour for the automobile manufacturer is to develop the details of his engine. This study is so absorbing and important that the duty of producing axles and other parts has been left to other specialists.

Our specialty is the manufacture of parts for the very highest class of cars—parts that are as good as life insurance. We make:

REAR AXLE: Independent Shaft Drive, Ball or Plain Bearing, Weight Carried Entirely on Axle Tube

FRONT AXLE: I-Beam Section Nickel Steel Bed, Ball or Plain Bearing

CHANGE GEAR

STEERING GEAR

CLUTCH

DISTANCE ROD AND BRACKET

PROPELLER SHAFT

LEVERS FOR EMERGENCY-BRAKE AND CHANGE-GEAR

Parts of one size are suitable for cars weighing up to 2400 lbs. and of 30 h. p.
Parts of the other size are suitable for cars weighing up to 2800 lbs. and of 50 h. p.

SEARCHLIGHT SWINDLERS

The success of the Rushmore Lens Mirror Searchlight has been so complete that as a matter of course the lantern makers have been compelled to either try to imitate it or go out of business.

A number of them have conspired to keep us out of the automobile shows, have claimed that we do not make the celebrated Rushmore Lens Mirror and that they get their cheap flat lenses from the same place, and have resorted to every contemptible trick to deceive people into buying their trash.

Certain so-called jobbers have tried to push the sale of the imitation lights by issuing lists of what are insinuated to be our prices in comparison with their alleged cheap prices. The statement that we ask the prices quoted is a deliberate and malicious lie. The prices they offer are but a few cents lower than ours, while the fake lights they offer are by comparison not worth their weight as junk.

Some of the fake jobbers refuse to furnish the Rushmore light when requested to do so on the plea that we cannot make delivery. That statement is likewise a deliberate lie. They offer to refund your money if not as represented, but you had better hold on to your cash.

We do not ask any money in advance, but will send the Searchlight on ten days' free trial to anyone worthy of credit. The fake jobber can make but 25 per cent to 30 per cent on the Rushmore, while he clears 100 per cent to 200 per cent on the fake lights which he obtains on consignment. Do you wonder that he is willing to cheat you?

Our prices are the lowest for the quality and we ship from stock.

Glad to Get Back To GOODRICH TIRES

Mr. H. C. Baxter of Walpole, N. H., in a letter of ~~September~~ 12, 1905, writes as follows:

"I am glad to get back to the use of your tires, after having satisfied my desire to test a foreign make, which I have found did not give me as good service on our country roads as yours, which I have used for years, have given me. I shall use your make in the future. At present I have a 24 h. p. Peerless, which I am using to make business trips between our canneries in New Hampshire and Vermont."

Yours truly,

H. C. BAXTER.

THE BAILEY "WON'T SLIP" TIRE.

Regular Goodrich construction, but provided with the Bailey "WON'T SLIP" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyrighted mark have been inspected and pronounced perfect. We guarantee our tires only on rims so branded.

Timken-Lemoine Front Axle (Roller Bearing)

TIMKEN Axles and Roller Bearings are simply perfect in principle, design, construction and in operation. They *do what others almost do.*

That's why they meet the requirements of exacting engineers of the leading automobile manufacturers. They're made a little better than seems necessary—result, they do what others *almost do.*

We have an efficient hustling corps in our selling organization, on the theory that our business is to assist you to increase your business.

Put the burden of the proof on us, use our axles and bearings and your experience will be that of thousands of others—not a dissatisfied customer.

Write us about it. Direct drive axles, divided and solid rear axles, knuckles, special bearings and cups, wheels and channel rims.

DON'T EXPERIMENT

Just Sell

THE FORD

MR. AGENT:—Over 2,000 Automobile buyers decided during the past season not to experiment. They all bought "Fords." It is even more important for the retailer to *sell* a car of known merit than it is for the purchaser to *buy* one. The buyer only loses his *money*, but the Agent who sells a car not up to standard loses both *prestige* and *reputation*.

The success of the Ford Motor Co. is built on the success of the Ford Cars, and you know how great our success has been. Remember that people like to do business with successful firms, and a *car with a reputation is easier to sell than an unknown*.

You know the general rush to the Ford exhibit at the shows and how they all ask *"What has Ford this year?,"* plainly indicating that automobile men look to Henry Ford for new ideas and originality of design.

We have a surprise or two up our sleeve this year—particulars about October 15th—nothing before—except that there is certainly good business ahead for the Ford agent in 1906, and it might be well to write us and see if we can give you the proposition and the territory you require.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

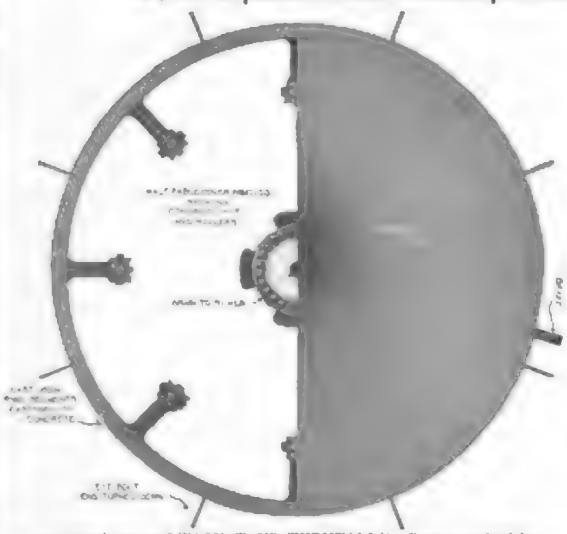
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.



Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

Why Premier Cars

Appeal to All Classes

To the Professional Man—because of its simplicity.

To the Business Man—because of its readiness to go at all times

To the Repair Man—because of its perfect accessibility to working parts.

To All Men—because of its low cost of fuel and maintenance.

We have much data from drivers on this latter point: for instance, one writes us: "The total cost of my running this season—5,000 recorded miles—is only a trifle over one cent per mile for the car, or 1-5 to ¼ cents per mile per passenger; total for repairs, fuel, etc., excepting tires."

These are points to remember when purchasing a car.

The Air Cooled Season never ends.

Side Entrance $1,500. Runabout $1,250

THE AUTO-METER

on a car tells the speed of travel and the distance traveled. It is absolutely accurate.

"Built Like a Chronometer."

When you are whirling along, a glance at the Auto-Meter before you, tells you **exactly** how fast you are going if your pace be as slow as a fraction of a mile or as fast as 60 miles an hour.
When a trip is finished, the Auto-Meter tells **exactly** how many miles you have gone on that trip.
When the season is over the Auto-Meter tells **exactly** how many miles you have covered during the season.
All this is worth while. Is it not?
Get acquainted with the Auto-Meter. It will lead to lasting friendship.
Write for catalogue and pamphlet, "Indisputable Evidence." The latter gives the interesting experiences of many prominent automobile owners

THE AUTO-METER

"BUILT LIKE A CHRONOMETER"

TELLS THE SPEED OF TRAVEL TELLS THE DISTANCE TRAVELED

Tells both with absolute accuracy

The **Speed Dial**, six inches wide and easily read, records the speed of a car from a fraction of a mile to sixty miles an hour and does it unerringly.
The **Trip Dial** records the distance traveled on a trip or for a day.
The **Season Dial** records the total distance covered in a season.
There is satisfaction in knowing how fast your car is traveling, satisfaction in knowing how far it has traveled. You enjoy this double satisfaction with an Auto-Meter on your car. Some one of your friends surely has one. Ask him about it.

In the meanwhile let us send you a catalogue and interesting pamphlet, "Indisputable Evidence."

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the **two** cycle two cylinder Elmore engine. Understand—the **two** cycle two cylinder Elmore engine produces **two impulses every time the flywheel turns.** As you know, the two cylinder **four** cycle furnishes only **one** impulse every **fourth** time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

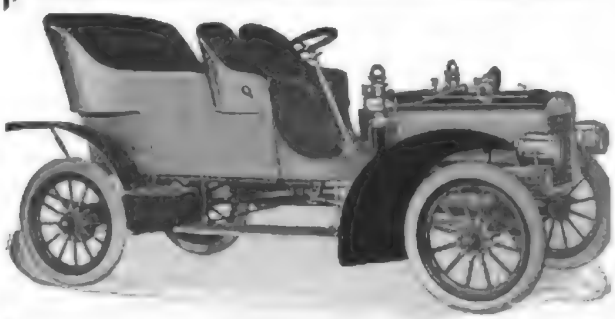
MOLINE



18-20 HORSE POWER

Model "B" - $1,600

Four cylinder vertical motor that develops more than the rated H. P. Pulls through heavy roads and up hills in a way that surprises the owners of higher priced cars.

Has all the good features of most $2,000 machines and costs $1,600

For the first time this season we can make immediate deliveries

We have only a few of them left and they will go quickly. Perhaps our proposition might interest you.

Model "D" Our stock of these substantial 12 H. P. Touring Runabouts is decidedly limited. The price we are making is clearing them out fast. If you want one, speak quick.

THE COIL THAT DOES THE TRICK

In the Climb to the Clouds

Chas. Soules, driving a Pope-Toledo fully equipped Touring Car, made the ascent in 29:37 2-5. This is considered a most wonderful performance. Besides

SPLITDORF COILS

were winners in nearly every event. Ask the Glidden Tourists how they like the Splitdorf Coil. Seventy-five per cent of the cars on the tour were equipped with them.

HERE IS DR. PARKER'S LETTER:

Mr. C. F. Splitdorf. June 24th, 1905.
Dear Sir: I feel that in the recent 200 mile contest my success, in a large degree, was due to your coil. It seems to me that your latest is superior to anything in use to date. I tell my automobile friends to give me a SPLITDORF for reliability every time. Very truly, C. B. Parker.
167 Remsen St., Brooklyn, N. Y.

Winner of Recent Economy Test of Long Island Automobile Club

C. F. SPLITDORF 17-27 Vandewater St. NEW YORK CITY

The Largest and Most Successful Coil Maker in the World.

THE HAYNES 1906 four cylinder REGULAR STOCK TOURING CAR qualified for the Vanderbilt Cup Race in competition with a long list of the most powerful specially constructed racing cars ever built in America.

Compare the cylinder capacity of the engine in the HAYNES car (5 in. bore x 6 in. stroke) with that of all other entrants. Nutt had been around the course in this car only three times prior to the race and was the only contestant who had never before driven in a race. The only stop he made with the HAYNES car was necessitated by an oil can bouncing into the fly wheel and spilling oil on the master clutch, causing it to slip.

Just think what it means for a stock touring car to win honors from specially built monster racing cars. That is what THE HAYNES STOCK CAR did. IF YOU ORDER A HAYNES 1906 TOURING CAR YOU GET AN ABSOLUTE DUPLICATE OF THE CAR DRIVEN IN THIS CONTEST.

We are now booking orders and closing agencies for 1906 HAYNES CARS. Write us to-day.

Among *the* Leaders *in* Eliminatin' Race

OUR regular stock model finishes third in Vanderbilt Cup Race trials. Just think what we are offering you this year. It is like this. You sit behind the wheel of a *Royal Tourist* with one hand on the throttle lever. Move the lever an inch or so and you have an ideal vehicle, under perfect control, for city use or country touring. Move the lever a little more and you have a motor car, fit to compete with the speed machines especially built for the *Vanderbilt Cup Race*. Please bear in mind the fact that the famous Royal that did so well in the Elimination race held Sept. 23 is the same as the one you buy from us in every particular except, of course, you get a luxurious and handsome body, instead of a couple of tin seats.

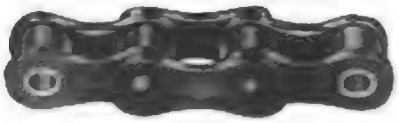
Chain Drive Wins
Vanderbilt Cup Trials



"DIAMOND" CHAINS were on the winning car in the eliminating trials for the Vanderbilt cup. The second car to finish was also driven by "DIAMOND" CHAINS.

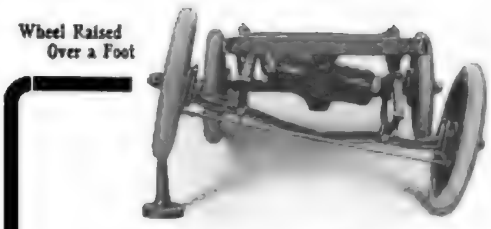
BOTH COVERED THE COURSE IN ABOUT 22 MINUTES LESS TIME THAN THE THIRD CAR, WHICH WAS GEAR DRIVEN

Judicious selection of materials and accuracy of manufacture account for the successful performance of "DIAMOND" CHAINS.

TRADE ◇ MARK.

When your old chain is worn out try a "DIAMOND." It fits any standard sprocket.

DIAMOND CHAIN MFG. COMPANY
INDIANAPOLIS, IND.



Real Comfort on Rough Roads

It isn't enough to say "this car goes anywhere" So does a log-wagon; that doesn't mean that you would want to ride on it.

THE MARMON
"A Mechanical Masterpiece"

Is the only car that is not built on the unyielding principles of a log-wagon. The flexibility of its running gear is such that, over the roughest roads, its mechanism is always in alignment, free from binding and twisting strains. It can be run at good speed over rough roads with a freedom from jar, jolt or vibration—a very luxury of motion—that is unknown in any other car, all due to an exclusive patented Marmon feature.

Double Three-Point Suspension

Cast aluminum body on one frame, power plant on another frame, each frame suspended on three pivotal points. Eliminates the ruinous strain inevitable in the rigid suspension of all other cars. Means greater efficiency and less wear on all parts, tires included. Four cylinders air-cooled. A carefully constructed, high-grade proposition for those who want nothing but the best. :: :: :: :: :: WRITE FOR BOOKLET No. 1.

PATENTS PENDING IN ALL COUNTRIES

The Little Wonder Carburetor Manufacturing Company

347 Franklin Street
BUFFALO, N. Y.

This carburetor will fit all classes of motors, from one-horse power up, and is especially adapted to automobile and marine engines.

The "Little Wonder" Carburetor, used in connection with our Hot Air Generator on the exhaust pipe, is guaranteed to increase your horsepower from ten to twenty per cent, economizing in fuel consumption, giving a perfect mixture in quantity and quality at all engine speeds; it is 100 per cent safer than the float-feed carburetor, and is positively guaranteed not to ignite or explode, and is absolutely impervious to flame or back-firing.

The "Little Wonder" Carburetor is hot-air jacketed, as enclosed cut shows, thereby increasing the vaporization of the gasoline, and giving a hot gas mixture under all atmospheric conditions. Our Carburetor will not leak, freeze, flood or cause any trouble, as is the case with other carburetors now on the market. Our object in placing this carburetor on the market has been to supply the increasing demand for an entirely automatic, simple, reliable and absolutely fireproof form of carbureting device. That we have succeeded in our efforts has been thoroughly proved by the appreciation of the many users and advocates of the pump-feed type of carburetor. In the "Little Wonder" Carburetor the air as well as the gasoline can be regulated at will by the operator. Our Carburetor is so simple that anyone of ordinary mechanical ability may perfectly adjust and apply same to motor.

Prices quoted upon application.

Generator, listed $10.00 **Carburetor, listed $15.00**

Ask for quotation and give diameter of exhaust pipe, 1½" up.
We build Gas Engines and Steam Engines; also Racing Machines for roadway and waterway, all combined in one. See cuts.
Ask for prices on our Wheel Crank for pulling off and on wheels.

Respectfully yours,

J. C. W. FERRAR, General Manager and Owner.

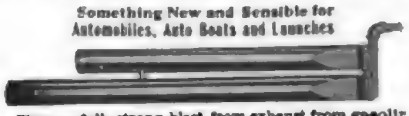
A PLEASURE TO HEAR
THE GABRIEL HORN
Something New and Sensible for Automobiles, Auto Boats and Launches



Blows a full, strong blast from exhaust from gasoline engine, or can be attached to steam, same as ordinary whistle; blows with less than one pound pressure.
Each horn is tuned to a musical key—no discordant screeching note—is easily blown, and is strong as durable.
Comes in three styles—single, two or three horns.
Write today for Catalogue, giving prices and full information.

Bausch & Lomb
MANGIN
Search Light Mirror Lenses

Afford the only means of utilizing ALL of the light produced by the burner of an automobile headlight. You never can have too much light if you want to ride safely at night. Be sure your lamp has a B. & L. Mangin Mirror.

¶ These mirrors are of optical glass as accurately ground and polished as the search-light mirrors used on battleships, silvered by our own process, which assures the utmost brilliancy and permanence and tempered to withstand heat and vibration.

¶ See that your lamps have these mirrors. They are used by all the best lamp makers.

¶ When used on launches and motor boats of all kinds you are insured against accidents.

WANTED—Second hand motor cycle for cash. Must be a bargain. B. G. Raymond, St. Cloud, Minn.

FOR SALE—1905 Marion air-cooled car, or will exchange for a 1905 White. Dr. A. B. Poore, Cedar Rapids, Ia.

FOR SALE—Haynes-Apperson, 16 h. p. touring car; used very little; in perfect condition; a snap for the early buyers. Burney Bird Auto Co., 319 Wabasha St., St. Paul, Minn.

FOR SALE—1904 Northern touring car, with new 1905 motor, extra tires, large headlight. A bargain. Address C. E. Haynes, Cadillac, Mich.

MANUFACTURERS

Desiring a practical "Auto" man with sound business judgment, experience in manufacturing lines and repairs on cars, for salesman, agent, office, etc., will correspond immediately. Address C. B., Motor Age.

WANTED—First class automobile shop man. Must be a good all-round man. State age, experience, present wages, wages expected. Write for further information and send references to Abbott Cycle Co., New Orleans, La.

FOR SALE—Model L Rambler; has double opposed motors, 16 h. p.; looks well and in good condition; tires almost new; sell cheap. One 1905 Model F four-cylinder, air-cooled Premier; new; never run; sell at a bargain. W. E. Rudy, Lima, Ohio.

PEERLESS 1904, four cylinder, 24 h. p., $1,500; aluminum body; tires new; will give one hundred mile demonstration. Bargain. D. W. Worthington, 326 N. Broad St., Philadelphia, Pa.

FOR SALE—Rambler runabout, in first class condition, $250; must sell. Chas. Newcomb, Huntington, Ind.

BARGAIN—1904 White Steamer, in first class condition; looks like new nearly; not much used; thoroughly reliable. Buy the best. Alfred L. Wilson, 105 Miller Ave., Columbus, O.

FOR SALE—A good established automobile business located in the northern part of Illinois in city of 40,000. Only automobile business in city, with over one hundred cars in use. Party owning business engaged in other lines and cannot give sufficient time to the automobile work. Address J. G., Motor Age.

FOR SALE—Knox, $600. Nearly good as new. John W. Higgins, 228 West St., Worcester, Mass.

AUTOMOBILE FIRM closing out business. Studebaker electric runabout (brand new) at great reduction. Pierce stanhope (slightly used, fine condition) very cheap. Address 561 Woodward Ave., Detroit, Mich.

FOR SALE—1905 "Franklin" runabout in absolutely first class condition, used for demonstration only, and has had the best of care and is in every respect as good as new. R. D. Hamlen, 230 Grand Ave., Milwaukee, Wis.

FOR SALE—Olds Runabout, just overhauled and in best of running order. Rear tire nearly new. New top, never used. $100 worth of extras. All for $370. Will demonstrate. C. D. Dullo, No. 42, Webster, Iowa.

MARION side entrance, four-cylinder car, $1,050. A. Zell, Park Ave. and Biddle St., Baltimore, Md.

FOR SALE—Packard Model L, four-cylinder, rear entrance, perfect condition, new last November, run but 1,500 miles; price $2,000. Also Packard, four-cylinder, Model N, side entrance, perfect condition, new in June, run 2,000 miles; price $2,100. So perfect the condition of both machines that they can scarcely be told from new cars. Address Theodore Strawn, Ottawa, Ill.

FOR SALE—1905 Olds Runabout; excellent condition; not run over 800 miles; $220 worth of extras. First check for $570 takes it. I. A. Coon, Manchester, Iowa.

FOR SALE—Light touring Cadillac, Model 1905, perfect condition. Address P. O. Box 396, Johnstown, Pa.

FOR SALE—1904 Indian motorcycle, perfect order, $125. Lock Box No. 97, Muskegon, Mich.

WANTED—Light touring car; good order, priced right. Franklin preferred. Lock Box Newport, Ind.

WANTED—Automobile agent for Illinois product. Covers four-cylinder cars second to none made in this country; prices, $3,000 to $4,000. Certain conditions make this a great opportunity for high class man with large acquaintance and capital enough to handle the business on a liberal scale. D., care Motor Age.

VOL. VIII NO. 15 CHICAGO, OCTOBER 12, 1905 $2.00 Per Year

READY FOR THE SECOND VANDERBILT

EVEN THE HORSE BUTTS INTO THE GAME ON LONG ISLAND

NEW YORK, Oct. 11—Special telegram—Chairman Robert Morrell and his cup commissioners have done all they can to have everything in readiness for the second competition for the Vanderbilt cup next Saturday over the 283 miles of highway on Long Island. The roads have all been freshly oiled, the constables who will police the course have had their final instructions, train service has been looked after, seating accommodations for the crowds arranged so far as is possible and if the weather man is kind there will be nothing to prevent the affair being a grand success. At this writing it is extremely doubtful if all the twenty original nominations will start. The withdrawal of Werner has left the German team in the hole, for while Basle and the Bowden Mercedes have been suggested as substitutes no application has been made to the cup commission to make the change, although the Bowden Mercedes has been declared eligible for the race. The Warden Mercedes has had hard luck in cracking a couple of cylinders and may have to drop out unless it can be fixed in time or an extra engine borrowed from Graves or Keene. Sartori broke his clutch this morning, but it is expected this will be easy to fix. None of the other cars have suffered any and it is expected that at least eighteen will line up for the start. That the time of the winner will exceed the predictions of the wiseacres after the trial seems certain. Practice trials by the foreigners, who have been the only ones to pull the throttle wide open, have shown that the course is undoubtedly one of the fastest ever used for an automobile road race, so it will surprise no one if between 62 and 65 miles an hour is averaged in the big event. The Americans have been saying nothing, most of them jogging along quietly, rounding out their road education and making themselves letter perfect for the actual competition. That the crowd will be a record one goes without saying, all the boxes and parking spaces

SIGNORA CEDRINO TURNS ASSISTANT MECHANIC

Digitized by Google

at the grandstand having been sold a week ago. Starter Wagner has brushed up his Italian, German and French and is prepared for the linguistic efforts of his life, so nothing remains but to run the race.

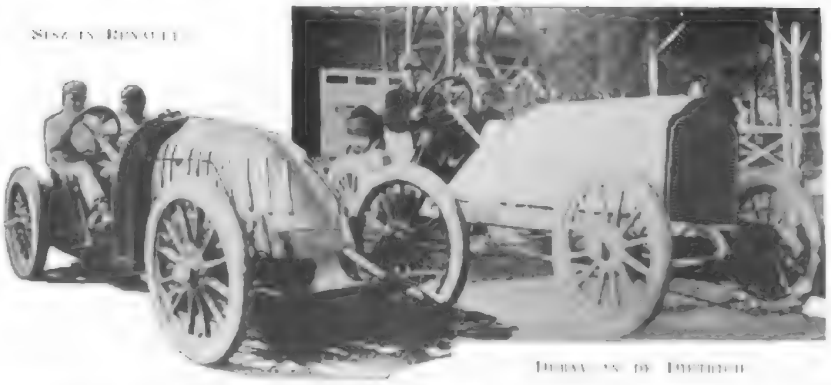
SARTORI BREAKS HIS CLUTCH

New York, Oct. 11—Special telegram—Sartori, in rounding the Jericho turn in practice with the Vanderbilt Fiat, broke his clutch this morning. In approaching the turn he threw out his clutch and in throwing it in again too quickly the break occurred. His car was towed back to the Fiat garage. It is said that a repair can readily be made in time for Sartori to start in the race.

Every effort is being made to repair the two cracked cylinders in the Warden Mercedes. Smith & Mabley, who are doing the work, expect to make a successful brazing which will carry the car through the race as well as the original. In a final emergency, as a last resort, an effort will be made to borrow an extra engine from Keene or Graves.

The Jericho pike was oiled again yesterday and left a slippery surface. The drivers accordingly practiced with care this morning. Lancia, Keene and Jenatzy made laps in 25 minutes, Nazarri 28, and Sisz 26. Christie, Heath and Dingley made slow rounds.

A story comes from the course this afternoon, that the Italian team men went to the White quarters at Bull's Head this afternoon with the idea of attacking Walter White, whom they accused of refusing to yield the road to allow Nazarri free passage in practice this morning. Walter White was not there. It is said that they went away muttering threats to ditch the White racer when they next encountered it on the road. There is no time to investigate the report and it is merely given for what it is worth. If White held the road, he had a perfect right to do so. Any attempt to ditch White would be a foolish move of equal peril to the Italian cars and it would not be good policy for the foreigners to arouse any American resentment, which might result in somebody getting roughly handled. The story is probably a mere rumor phoned in by some one who overheard some roadside gossip.



SISZ IN BENAULT

DURAY IN DE DIETRICH

Trains will leave the Thirty-fourth street ferry Saturday morning at 4 o'clock for Garden City, where an hour's stop for breakfast will be made; and another at

LANCIA, THE ITALIAN FAVORITE

5 o'clock direct for Mineola. Ferry boats will leave every 15 minutes and will take aboard all cars possible.

SPECULATION ON SPEED

New York, Oct. 10—An inkling of what may be expected in the direction of sustained speeding in next Saturday's race was given during this morning's practice by Wagner with the de Dietrich and Sisz with the Renault. That the prophesy of the foreigners that 63 miles an hour at the very least may be looked for is made with good grounds was proved beyond question. Wagner covered 3 laps at an average of 26.12, including stops for gasoline and water each time. This showed 1 hour 18 minutes 36 seconds for 84.9 miles as against 1 hour, 32 minutes 36 seconds scored by Tracy, the leader at this point in the American race. The average per hour was a bit over 65 miles an hour.

Hardly less meritorious was the run of Sisz, who covered 4 laps at an average of 26.30, or, in other words, 1 hour 48 minutes for 113.2 miles, as against Dingley's 2:00:50 in the elimination trial, the Renault's average was 64.07 miles an hour.

By way of a sop to American hopes, however, it is to be recorded that Christie picked up Wagner en route and trailed him mile after mile without being shaken off, despite the fact that only three cylinders of the direct drive racer was in commission owing to a broken porcelain.

A much to be regretted accident occurred during practice, which may rob the German team of another member. It was the cracking of two cylinders of the Warden Mercedes. It is possible, though, that Warden may be able to borrow an engine from Graves or Keene, each of whom has an extra one in his repair shop.

The chances of Basle and the Bowden Mercedes being substituted for Werner are not good. At last night's meeting of the commission there was nothing at hand in the way of a request for the substitution by Mr. Dinsmore, on which action could be taken and so none was. E. T. Birdsall's report, however, was that the Bowden car was eligible. As a matter of fact, Basle has not been over the course and putting him in the race at the last moment might be unwise. Should Warden, however, be down and out for good, there would seem to be a chance for Basle being put in after all that the German team may have more than two representatives.

At this late day there is little inclination on the part of the drivers to take the risk of fast speeding. The laps this morning were rather cautiously covered as follows: Jenatzy, 29 minutes; Cedrino, 28 minutes 30 seconds; Nazarri, 26 minutes 40 seconds Sartori, 35 minutes; Tracy, 33 minutes 30 seconds; Dingley, 32 minutes 30 seconds Campbell, 48 minutes, and White, 45 min

FACTS ABOUT THE TWO VANDERBILT CUP RACES

The course—A circuit on Long Island, starting at Mineola, where the grand stand is located, thence through Jericho, East Norwich, Brookville, Greenvale, Albertson, Lakeville and Hyde Park to Mineola.

Distance of the 1905 race—Ten rounds of 28.3 miles each; total, 283. Turns made to the left.

Distance of 1904 race—284.4 miles.

Number of entries for 1905 race—Twenty; five each representing France, Germany, Italy and America.

Number of starters in 1904 race—Seventeen, representing France, Germany, Italy and America.

Starting time of 1905 race—6:30 a. m., October 14, cars leaving at 1-minute intervals.

Number of corners on course—Six, of which five are to the left and one to the right. No controls and no official stops required.

Winner of 1905 American eliminating trial—Bert Dingley, in Albert L. Pope's 50-horsepower Pope-Toledo.

Winner of 1904 Vanderbilt cup race—George Heath, in a 90-horsepower Panhard, representing France.

Time of winner of 1905 American eliminating trial—2 hours 50 seconds.

Time of winner of 1904 Vanderbilt cup race—5 hours, 26 minutes, 45 seconds.

Average speed of Dingley—50.2 miles an hour.

Average speed of Heath—52.2 miles an hour.

Referee of 1905 race—W. K. Vanderbilt, Jr.

Chairman of Vanderbilt cup commission—Robert Lee Morrell.

Starter—Fred J. Wagner.

Value of Vanderbilt cup—$2,000

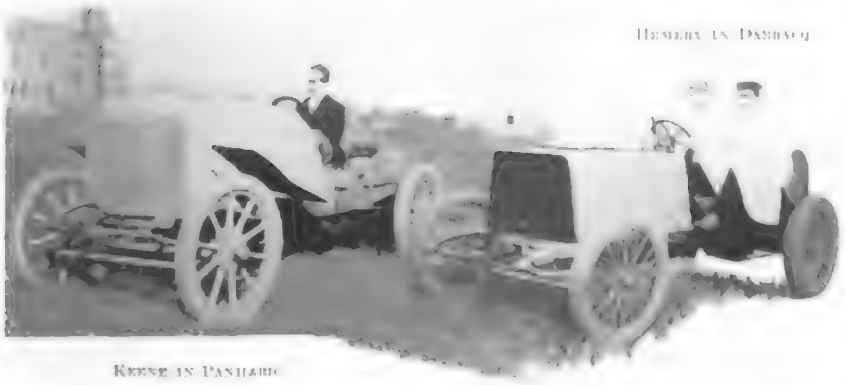
Weight limit of all cars in 1905 race—2,204 pounds.

Highest power—Duray's de Dietrich, 130 horsepower.

Lowest power—White Steamer, 40 horsepower.

Types of cars—One steamer; one six-cylinder gasoline car; all others four-cylinder gasoline cars.

Digitized by Google



KEENE IN PANHARD

utes. After covering laps in 50 minutes Lancia and Keene did not again make their appearance at the timing station at Krug's. Lytle is expected at Pope circle today by camp followers of the Pope man.

At the request of the foreign drivers Senator Morgan has postponed his banquet to them at the New York Press Club 1 week. The affair will take place the evening following the Dewar cup race. The Automobile Club of America is to give the European visitors a smoker and banquet at its club rooms next Monday evening.

Each of the three tires represented—Diamond, Michelin and Continental—will have five repair stations, each manned by an adequate force of quick repair experts. Car repair stations will be established near them by the users of their tires. Tents, grand stands and refreshment booths are now being erected all along the Jericho pike in the neighborhood of the grand stand. An addition to the latter is being built, which will add 120 seats. From the stand to the Mineola railroad crossing below Krug's, wire barriers will be stretched to keep the crowd back from the road.

KEENE KICKS ON No. 13

New York, Oct. 9—In response to a vigorous kick put up by Foxhall P. Keene at his allotment of 13 on the occasion of the drawing of the order of start at the A. C. A. last Monday night, the members of the German team met at the Garden City hotel Saturday morning and drew for the order of their start. Mr. Keene has a bit of the superstition of an all-around sportsman and particularly the dread of a turfman for the hoodoo number. He insists, though, that his kick was rather at the arbitrary allotment of his place in line by Mr. Graves and Mr. Stevens after the German team had drawn No. 1 than at the No. 13. He thought he should have had a chance to draw a place higher up in the line of starters, and so made formal protest to Chairman Morrell. This diplomat easily brought about another drawing.

For the third time the lucky Graves pulled No. 1 from the hat and again allotted it to his driver, Jenatzy. Mr. Keene bettered his place by drawing No. 5. Mr. Worden, who first was given No. 5, dropped back to No. 9, just behind Nazzarri. No. 13 fell to Mr. Stevens, who, it is reported, through Campbell, will if compelled to take that place in line, insist in substituting the letter Y on his car in place of the hoodoo number.

No. 17 again fell to Werner; but Werner did not come over because Clarence Gray Dinsmore could not get his Mercedes from the Connstatt factory in time for shipment. It is possible, though, that this number may be borne by a substitute; for as soon

JENATZY, GERMANY'S PRIDE

as Dinsmore announced the withdrawal of Werner, Chairman Morrell got busy on the Boston long-distance wire with a suggestion to Henry L. Bowden that he substitute Flying Dutchman II, his 90-horsepower Mercedes, which last year secured the track records from 3 to 10 miles at Providence, with Charles Basle as its driver. Bowden replied that there had been some home tinkering done with the transmission, which might make the car ineligible under the rules. Anyhow, he promptly shipped the racer to this city for inspection by E. T. Birdsall, of the A. A. A. technical committee, who will report his findings at a meeting of the commission at Garden City tonight.

EARLY WEEK GOSSIP

New York, Oct. 9—In automobiledom there is no talk but of the Vanderbilt cup race. Now that the foreigners have arrived and the papers are filled with their pictures and stories of marvelous speed accomplishments, the general public has caught the enthusiasm of the race and one overhears the names of Lancia, Hemery, Jenatzy and the whole outfit of cup candidates in subway and elevated train talks. As for the Long Islanders of the Nassau county vicinage, they have given themselves up soul and body to the race. At roadside taverns o' nights the farmers gather and talk race, and in the early morning hours the rustics perch on the fences to see the machines go by.

The chief center of action and gossip is at Frank Krug's, at Mineola, just below the grand stand. Here are quartered in the garages the thrifty Krug built especially for the race times, Sisz with his Renaults and Duray with his de Dietrichs, for each is supplied with two cars. In barns hard by are the Panhard of Heath and the Mercedes of Jenatzy. Less than a mile away, at Poirrier's, near Hempstead, is the Italian camp, which mechanics included numbers twenty men, the biggest outfit of the race.

John B. Warden makes his headquarters at the Garden City hotel. All these camps are well represented at the mighty gathering at Krug's, where piano-playing, singing, lively banter and warm argument come in turn. Once in awhile some of the boys from the Pope circle come over to hobnob with the Europeans.

The White outfit is at Bull's Head tavern, and the Darracq people have engaged

CEDRINO AND SARTORI, IN FIAT CARS, MEMBERS OF THE ITALIAN TEAM

the whole Bull's Head inn. Joe Tracy is at Lakeville with the Locomobile, Christie is at the Beckman estate down the Jericho pike, and Campbell puts up at the Mansion house. Foxhall Keene stops at his father's country place at Far Rockaway.

At any hour of the day a visitor to any one of the camps is sure to find a bunch of mechanics puttering with the racing cars, captained by their drivers, who seem to be working the hardest of all. There seems to be always a little bit more to be done to a car. No driver appears satisfied that it is put as it ought to be and a pulling apart of the whole machine looks to be the invariable postscript to a trial.

It has taken a lot of time to get the two Darracqs and the Lancia and Nazarri Fiats cleaned up and put in order for practice. They were shipped direct from the Florio cup race and their machinery was clogged with dirt and oil. This morning was the first time that Lancia had his racer out. He covered successive laps in 27 and 26 minutes, which was a satisfactory showing for a first tryout in the minds of those who can see none other in the race but Lancia.

The practice hours, from daylight to 7:30 o'clock, are, of course, the interesting times. Long before sunrise the camps are astir. With the first peep of day the drivers are on the road. Most of them pilot their racing cars, but others are content to practice on the turns with stripped touring cars.

There have been, as might be expected, stories of lap times scored in practice that are hard to credit, though on the whole the reports of the early morning clockers seem to be well within reason. The published statement that on Friday morning Hemery scored a lap in 21 and Duray a circuit in 22 minutes is hard to believe. This would mean an average per mile of about 45 seconds and that, too, in the face of all the sharp turns and twistings of a road route. The fastest lap in last year's race was made by Tarte in 24:04. Those who argue in favor of the acceptance of the 21 minutes and 22 minutes of Hemery and Duray point to the fact that a lap last year was a fraction of a mile longer, that two stops for controls had to be made and that the 1905 cars are seconds faster to the mile than those of last year. On the other hand it must be remembered that last year the racers had two very long straights for fast going. Even bets have been made that neither 23, 22 nor 21 minutes wil be beaten on the day of the race. Friday is the only day that Hemery and Duray have attempted fast going.

The Americans, barring White, have been conspicuous by their absence from the course the past week. Every morning, though, Walter White has made his two or three rounds at a safe, even rate of going. He is absolutely non-committal as to his opinion of his chances and will go no further than to intimate his belief that the average time of the leaders will be by no means as fast as some of the quoted laps would indicate. Tracy got back from the factory with his Locomobile yesterday and gave it an easy try-out this morning. Christie has been at work a week over some additions and alterations to his car. Dingley got back to Garden City with his four-cylinder Pope-Toledo on Thursday and in his try-out this morning went a bit faster than his first lap in the eliminating race, which he did in 27:58, the fastest of the race. Lytle was due to reach Pope circle yesterday, but was not reported on the course this morning.

In the hurrah that is being made over the practice of the foreigners one hears little mention of the Americans. The latter as yet have not made any high speed attempts and are making confidants of no one as to their hopes or plans for the race. Dingley, Tracy and White are generally estimated as having the best chance at making a creditable showing. Christie and Lytle are regarded as big gambles. The former's great speed is recognized, and should any great surprise be sprung by the Americans it is surmised that it will come either from White or Christie.

Automobilists who have persisted in speeding over the course have fallen into the time traps literally by the dozens. Included among the victims have been Chairman Morrell himself, and several of

NAZARRI

CEDRINO

CHEVROLET

SARTORI

Digitized by Google

KEENE CAMPBELL SISZ

the foreign drivers. The uniform fine has been $25.

Some nasty stories have been brought to Chairman Morrell of obstructions encountered on the track. In view of them he will have the course patrolled the entire night before the race. The deputies and spectators will protect the circuit on the day of the race.

Caillois, who finished second to Thery in the Bennett cup race, cables that he will reach here the night before the race and asks for an automobile to meet him at the dock to hurry him to the course.

After all, Webb Jay will not see the race. He will be moved from the hospital to the Iroquois hotel tomorrow, where he will remain for a week before returning to Cleveland. It was hard to persuade him that the journey and excitement of the race would be too risky a venture for him.

SKETCH OF THE DRIVERS

Of the twenty men named in this year's Vanderbilt cup race, only four of them started in the initial event—Campbell, Tracy, Lytle and Sartori. Seven of the twenty drove in the Bennett this year—Jenatzy, Duray, Dingley, Lancia, Tracy, Nazzari and Lytle.

Jenatzy, billed to lead off, won the Bennett 2 years ago and was second to Thery in Germany in 1904. He is a Belgian and an electrical engineer by profession. He is the veteran of the crowd, having been one of the five competitors in the first Bennett. He has the reputation for being a daring driver, ever ready to take a chance in order to win. He drives a Mercedes.

Duray, of the French team, in a De Dietrich, will chase Jenatzy down the long, yellow road on Long Island and will be one of the favorites, because of his showing in European road races this year. He finished sixth in the Bennett, third in the French trials, seventh in the Ardennes circuit and second in the Florio. He is also famous as a record-breaker.

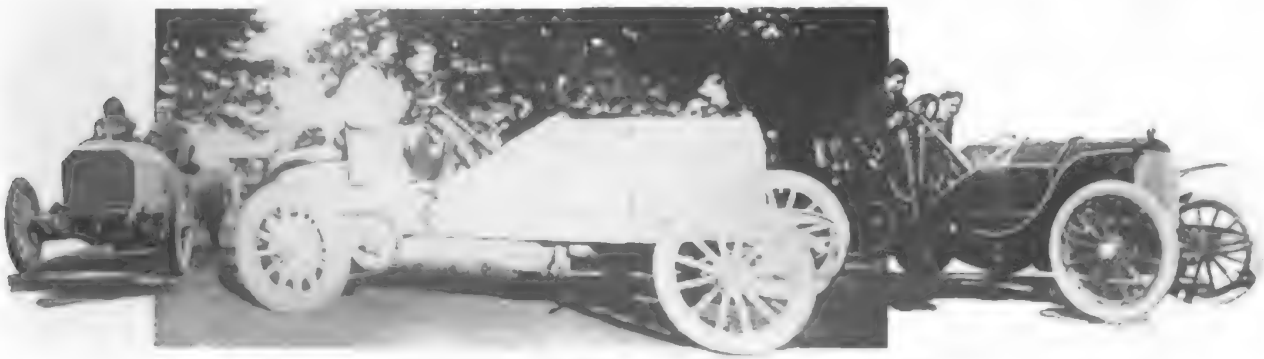
Dingley, in a Pope-Toledo, starts third and is the first American off. His win in the trial last month was his greatest motoring achievement, for he failed to finish in the Bennett. He is a Californian and gained his reputation by driving a 24-horsepower Pope car a mile in 1 minute ⅗ seconds in competition.

Lancia, in a Fiat, fourth to start and the leader of the Italian team, was famous only as a successful driver in touring events, up to last year, made his reputation by his showing in this year's Bennett, in which he threatened to beat Thery, leading the latter at one time, but being put out by a radiator accident. He was also a competitor in the 1904 Bennett, finishing eighth. Lancia ran third in the Florio.

Foxhall Keene, general all around sportsman, equally good at golf, polo or any other sport he takes up, had the supposedly unlucky number, 13. He is an American, although driving a car for Germany. He started in the Bennett race a few years ago, and is a careful and skilled motorist. He drives a Mercedes and starts fifth.

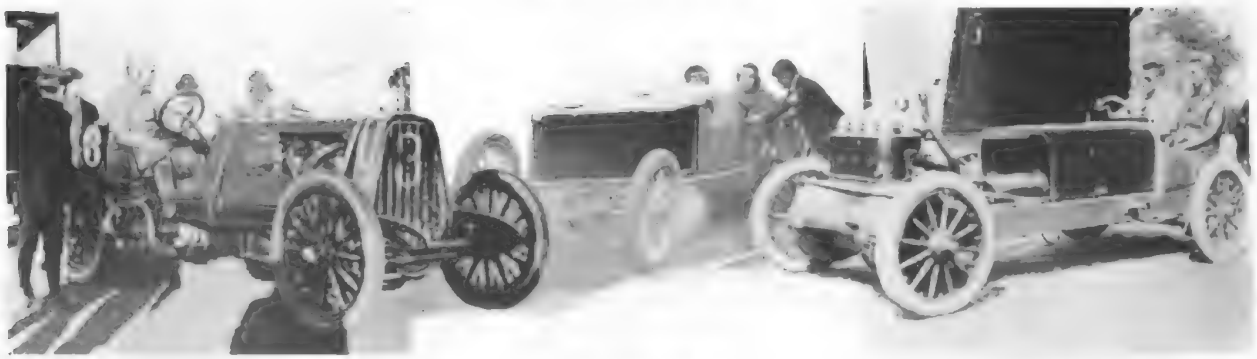
Wagner, sixth to start, is one of the French representatives who failed to qualify in the French eliminating trials, but who got on France's Vanderbilt team through the scratching of Thery and Caillois. Wagner finished fourth in the trials, just missing a place in the big race. He also started in the Ardennes circuit race, landing fourth money, while in the Florio cup race he finished eighth. He is in a Darracq.

Tracy, seventh to start, was runner up to Dingley in the trial. Tracy gained his technical education as an apprentice in British railroad engine shops and in 1898 built a gasoline motor of his own, while employed as an engineer in a New York apartment house. He drove the Bennett Peerless racer 1 mile in 55⅘ seconds at Ormond in January, 1904. He also took part in the Cuban road race last year, fin-



THREE OF THE GERMAN TEAM, JENATZY, KEENE AND CAMPBELL, IN MERCEDES MACHINES

Digitized by Google



DINGLEY'S POPE-TOLEDO THE WHITE STEAMER CHRISTIE'S FRONT-DRIVE

ishing second to Carricaburu, losing by only 30 seconds. His car is a Locomobile.

Nazzari, the Fiat Italian, who starts eighth, is renowned chiefly for the race he put up in this year's Bennett event, in which he finished second to Thery, beaten less than 17 minutes. He also competed in the Florio cup race, but sixth was the best he could get.

John B. Warden, Mercedes, starting ninth and representing Germany, is one of the two driving his own car. He is a man of international fame and in last year's Bennett drove a Mercedes car for Austria, dropping out in the third lap.

Sisz, Renault, who starts tenth, has not done much in road competition this year. He started in the French trial, but fifth was his fate in that event.

Christie, in a Christie, billed to leave eleventh, has made a great reputation for his Blue Flyer on the beach courses at Ormond and Cape May. So great was the confidence of the cup commission in his ability to make a showing with his car in the big race that he was unhesitatingly selected when the commission made up the team on its own accord.

Cedrino, in a Fiat, the Italian, No. 12 on the sheet, has done fairly well in track and beach competition in America this year. He has only been in the country a short time, coming here with an established reputation as a speed merchant on the other side.

Campbell, Mercedes, who gets away ninth, was substituted on the German team because of the withdrawal of Baron de Caters. Campbell was the first to start in the Vanderbilt last year, finishing fifth.

Heath, Panhard, starts fourteenth. He is the winner of the first Vanderbilt and since that victory has been out of the racing game. He comes out of his retirement in an effort to repeat his success of a year ago. Heath is an American by birth, but has resided in Europe for years.

Lytle, Pope-Toledo, fifteenth away, has the unique distinction of being the only American who ever finished a Bennett race. Lytle has been driving motor cars since 1895, when he handled a Duryea in the London to Brighton race, which he won. He also took part in Chicago and New York races the same year. He is driving one of the selected cars for America.

Chevrolet, No. 16, is inexperienced in road racing, but in the short time he has been before the American public as a track racer he has demonstrated his ability, having repeatedly beaten Barney Oldfield and having smashed the 1-mile record on the Morris park track. He is in as an Italian representative, being at the wheel of Major Miller's Fiat.

Hemery, No. 18, of the French team, in a Darracq, is one of the favorites because of his showing in the Ardennes circuit race, which he won from a crack field. He was also in the French trials, but finished ninth. He was picked to win the Florio cup, but Ruggio, Duray and Lancia slipped in ahead of him.

White, No. 19, is the last American to start. He will be at the wheel of the only steam car in the race, for which reason his work will be watched with interest. His only racing experience was in the American trial, in which he failed to finish. The commission, however, picked the White as one of the American team.

Sartori will start last and will represent Italy in the Fiat car nominated by the donor of the cup, A. G. Vanderbilt, Jr. Sartori was in last year's Vanderbilt, too, but one lap settled him. On the track Sartori has been a good man in his time, although now he is out of that branch of the sport.

GEORGE HEATH

FIRST VANDERBILT RACE

Since the running of the first Vanderbilt cup race there has come a new generation of motorists, enthusiasts all of them, but for the most part unfamiliar with America's great international road race. It is for the benefit of the recruits that MOTOR AGE delves into history and repeats what the majority of automobilists know, for few forget what happened one short year ago—how George Heath, representing France and driving a 90-horsepower Panhard, won the cup by such a narrow margin from Albert Clement, Jr., also a French team man, in a Clement-Bayard, that it was some little time before the real winner was known; how Herbert

Lytle, in a little 24-horsepower Pope-Toledo, struggled gamely through the crowd which overran the course, and finished third, and all the other interesting incidents connected with this motoring demonstration over the Long Island roads. The four countries that will again strive for the cup Saturday—France, Germany, Italy and America—were represented in the first contest for the trophy, which is evidently destined to become fully as famous as is the America's cup in the yachting world.

Seventeen nominees started, the French team being made up of Gabriel, in a 90-horsepower de Dietrich; George Heath, in a 90-horsepower Panhard; M. G. Bernin, in a 90-horsepower Renault; Albert Clement, Jr., in a 90-horsepower Clement-Bayard; Tarte, in a 90-horsepower Panhard, and Teste, in a 90-horsepower Panhard. Representing Germany there were A. L. Campbell, in a 60-horsepower Mercedes; George Arents, Jr., in a 60-horsepower Mercedes; E. E. Hawley, in a 60-horsepower Mercedes, and William Luttgen, in a 60-horsepower Mercedes. Paul Sartori and William Wallace, both in 90-horsepower Fiats, representing Italy, while Joe Tracy, in a 30-horsepower Royal; A. C. Webb, in a 90-horsepower Pope-Toledo; H. H. Lytle, in a 24-horsepower Pope-Toledo; Charles Schmidt, in a 30-horsepower Packard, and Frank Croker, in a 75-horsepower Simplex, carried American colors in the Long Island affair.

Only two of the lot finished the entire 284.4 miles, Heath winning in 5 hours 26 minutes 45 seconds, averaging 52.2 miles

WALTER CHRISTIE

an hour, with Clement second in 5 hours 28 minutes 13 seconds, an average of 52 miles an hour. Lytle went 9 laps, or 255.96 miles, in 6 hours 24 minutes 20 seconds, an average of 40 miles an hour. Schmidt, another American, was fourth, doing eight laps, or 227.52 miles, in 5 hours 50 minutes 27 seconds, 39.1 miles an hour. Campbell was fifth, covering the same distance as Schmidt, in 6 hours 30 minutes 9 seconds—35 miles an hour. Tarte and Luttgen each went 199.08 miles, Gabriel and Croker 170.64 miles, Webb 142.2 miles, Hawley 113.76 miles, Teste 85.32 miles, and Bernin, Werner, Arents, Sartori, Tracy and Wallace 28.44 miles each.

Mishaps were numerous. Tarte's rear tire came off, Gabriel suffered from a broken pump connection, Bernin had a broken propeller shaft, Hawley a broken spring, Arents upset, his mechanic being killed; Werner jammed his brakes at a railroad crossing, Webb ran into a tree, Croker had tire troubles, Tracy was put out by a cracked cylinder, while Wallace and Sartori experienced clutch troubles.

Heath's fastest lap was at the rate of 67.8 miles an hour, Teste being credited with the fastest with a 71-mile average. The total number of miles, exclusive of controls, covered by the seventeen contestants who completed one lap or more, was 2,502.72, or an average of 147.22 miles per car at the general average pace of 39.5 miles an hour. The twelve European cars covered 1,677.96 miles, exclusive of controls, or an average of 139.83 miles per car, at the average rate of speed of 43.9 per hour. The five American cars did 824.76, or an average of 164.95 miles per car and at the average rate of speed of 28.7 miles per hour.

The eight European cars driven by European drivers covered 1,023.84 miles, or 127.98 miles per car; at the average rate of speed of 43.5 miles per hour. The four European cars, driven by American drivers, covered 654.12 miles, or 163.53 miles per car; at the average rate of speed of 44.9 miles per hour. The nine cars of all kinds driven by European drivers covered 1,251.36 miles, or 139.04 miles per car; at the average rate of speed of 43 miles per hour. The eight cars of all kinds driven by American drivers covered 1,251.36 miles, or 156.42 miles per car; at the average rate of speed of 35.4 miles per hour.

AMERICA IN THE VANDERBILT CUP RACE

WHY have the foreign makers entered so many cars in the Vanderbilt cup race? From all that has been said of late respecting the Bennett and Vanderbilt trophies neither is particularly desired by the makers or the associations abroad, yet there must be some good reason for the expenditure of the amount of money needed to enter a team and carry it through a contest of such magnitude.

The fact is the foreign makers do not propose, if possible, to let it be said an American-made car won first or even second honors in its own race, much less in an event on the other side. The foreign makers are wrapped up in the idea that they have the best cars and the fastest cars, and they propose, cost what it may, to show to the effete easterners that America cannot build a car such as they would desire to own. There can be no other reasonable excuse for the entries of the foreign makes of cars other than pure advertising, in light of all that has been said about such contests within the past few weeks, and, this being so, what the foreigners propose to show is apparent.

It is conceded by most well informed people that a foreign car will win the Vanderbilt cup race, but it will not necessarily be because of better design or better mechanical work on the foreign cars; it will be a case of power alone, or possibly power and daring on the part of the drivers, for it must be conceded that in point of daring and experience the foreigners have a great lead on the American drivers.

But the winning of this big American automobile event will not show that American cars are not the equal of the foreign cars, and it will not prevent the American cars from going over the course at a good speed and in finishing in a most satisfactory condition. It will not prevent it being shown that American tires are such as will stand with any made abroad; further, it will not prevent the American drivers from showing that they know how to get their machines around such a course in good shape, which, after all, is the most important thing to be considered.

The American who will recall the last Vanderbilt race will remember how successfully two small-powered home-made cars navigated the course and finished without a scratch. It is true they were only third and fourth, respectively, but it is also true that they finished, while several foreign cars, of which much was expected, did not finish at all. Then and there did America begin to command the respect of other than its own makers and its own buyers. The demonstration, notwithstanding the absence of a popular win, was sufficient to boom the sale of American cars and to take a little edge off the sale of foreign-made cars, which had, however, made much of a showing in road competition.

American buyers of foreign machines have been led in their selection by speed and reliability shown in big road events, and just as soon as they realize that American machines can show equal reliability, combined with moderate speed, the luscious fruit will pass from foreign hands.

All the makers who entered cars in the Vanderbilt event did not hope to win even the eliminating trial, much less the final, in case their cars qualified. Most of these cars, however, made such a good showing as to prove the reliability of American-made cars.

This is what the race was designed to do. It has fulfilled its mission and the makers have fulfilled theirs. The American buying public has been shown what American cars can do, notwithstanding the fact that some cars were shut out of the big race by the arbitrary action of the cup commission. And there are just as good cars made in this country as those in the trial event, so that the buyer has a big field from which to select in making his purchase for next year.

No matter what may be the result of Saturday's race, American makers will have nothing for which to make apologies, unless it be in speed, and that is largely a matter of power. Power considered, the public may rest assured that America will not be lacking in its showing when the result of the race is known.

The American maker is in the position of having everything to gain and nothing to lose in such a competition; the foreigners are absolutely on the defensive. If an American car should win, it will come pretty near settling the foreign business in America; if the foreign car wins, it will be nothing more than was expected. The American makers are profiting by the race whichever way one may consider it, so that they have been more than justified in entering against the foreign giants—the pick of the world. After the years spent in developing the foreign racing car, the loss of this race will come as a severe blow, but with forethought worthy a prima donna, the foreigners have said this is their last.

The makers of American motor cars will regret any such action quite as much as will those interested in road speed contests simply for the sake of the sport they furnish. The American maker is grateful for the comparisons he has been enabled to make between his car and that of foreign manufacturer, and without the appearance of the foreign car in American contests he may be deprived of making such comparisons and of improving his manufacture as a result of such comparisons. He will, however, have the privilege of sending his car abroad to pit it against those entered in foreign competitions, and this will probably be the result, for it must not be supposed that an American will stop short of convincing the world that he is the equal if not the superior of any maker.

When the foreigner has left the American field of speed trials and the American maker attacks the foreigner on his own ground it will be all the more to the credit of the visitor should he succeed in wrenching from his adversary's grasp the honor for which the foreigner will fight to a finish. All in all, the outcome of this big event will prove profitable to the American in whatever light it may be seen.

DO SOMETHING; D—N IT, DO SOMETHING

AN American jurist, prominent during civil war days, had a son who had never showed tendencies to set the world afire; in fact, he was as near the ne'er do well class as he could be. His father was brilliant as a lawyer and one of the most prominent men of Lincoln's time. He had done everything to encourage his son to be something, but with poor success. Finally, becoming exasperated, he called the young man in and gave him a final talk, ending with this: "D—n it, do something—get drunk, if necessary—but do something."

Well might this advice be directed toward the automobile organizations, large and small, of this country. Winter turns into spring, spring into summer, summer into fall and fall into winter, and beyond hearing what will be done, the time for doing is still far, far in the future.

It would not require many columns of any paper to tell what the clubs and associations of this country have done for motoring during the past few years. The automobile orchard is filled to overflowing with ripe fruit, but the fruit is left to rot and to fall to the ground. With the exception of those directly interested, no one will deny this assertion.

Is all the work done? Have motorists received all they might receive? Are all laws reasonable? Are all roads improved? Are all benefits secured? Are all road crossings blessed with guide posts? Are all railroad crossings protected? Are all shipping rates fair? If the answer to these questions is yes, then why the automobile associations? If the answer is no, then why this state of somnambulance?

"D—n it, do something—get drunk, if necessary—but do something."

Jump Sparks

"Will the auto craze be merely a craze?" asks the Hub, a carriage paper. Will water become water?

Over across the pond they think motor boat racing a frost this year. America has a counter-claim in announcing airship racing a failure.

Megargel has had to use the cable to get him out of difficulties in Wyoming. But that's better than using the telegraph to wire for financial help, as some of the Clarences and Claudes do occasionally.

All those who finish behind the winner of the Vanderbilt cup race will find the little word "if" awfully handy in postmortemings to the newspapers after it is all over.

France declared herself just before the Bennett race and won it. Maybe she believes announcing she will not defend the Vanderbilt cup if she wins it will land that trophy for her, too.

What chance has the football player to gain any notoriety this week with the Giants and the Athletics playing for the baseball championship and the Vanderbilt cup race being run in the east? But football will be IT for the succeeding 30 days.

If there was a babel of voices and a confusion of tongues at the drawing of positions for starting in the Vanderbilt cup race, what may be expected at the finish of the race if America should happen to win the event?

Any motorist who has faced the glaring headlight on the front of an interurban street car will recognize the justice of the kick of his Pennsylvania brethren who want the street car companies to subdue the blinding shaft of light. They certainly want the glim doused.

In forcing the French makers to recognize the right of the English manufacturer to bid first for the business to be found in the United Kingdom by compelling them to exhibit at the Olympia show, John Bull has sort of put one over on his friend, the enemy across the channel.

Last Sunday the driver of a horse struck a match with which to light the lamps on his buggy. His horse became frightened at the flash, ran away, and the man's wife was killed. The only reason an automobile was not blamed for the accident was that no automobile was around at that moment. But it required an automobile and a chauffeur to stop the horse and save the other occupants of the rig, so count one for the automobile, anyway. Furthermore, the chauffeur proved so modest that he left without even making known his address or his identity.

T W

Final preparations made for running of Vanderbilt cup race Saturday; course is rerolled and fast times are reported to have been made; German team has redrawing because of Keene's objection to No. 13; Basle a doubtful starter.

W. H. Baker, general counsel of National Association of Automobile Dealers, tells of growth of body from seventy-five to 126 members; demands meeting with recognition.

Annual convention of Carriage Builders' National Association, held in Philadelphia, pays considerable attention to automobile industry.

Ballot for space at Olympia show, which opens in England November 17, held, there being 250 stall holders; France forced to exhibit.

Ford, Christie and Thomas cars already entered for Dewar cup race to be run on Coney Island boulevard, New York, next Wednesday.

Annual cross country run of Automobile Club of Philadelphia for Brazier cup won by G. P. Fletcher in a Packard.

Megargel, on his way west, encounters all sorts of difficulties in Bitter creek region of Wyoming.

England holds dust trials which prove nuisance is largely question of speed and dust.

Chronograph Club of Boston secures control of McMurtry timing system.

Entries already coming in for next year's Tourist trophy race.

Madam du Gast, the prominent European motorist, has not been heard from for a long time, having apparently dropped from sight for some unknown reason.

WHERE IS MADAM DU GAST?

Anyway, let's hope the winner of the Vanderbilt, whoever he is, is good to his folks.

What a nice lot of advertising the donor of a trophy receives! Only in the case of young Mr. Vanderbilt he neither needs nor desires it.

England has just held a set of trials to discover a way to lay the dust. Over here the average motorist is scratching under his bonnet to find a scheme to raise the dust.

Even if the Vanderbilt cup does go abroad there is consolation in the knowledge that the America's cup is apt to remain on these shores for some time to come.

Barney Oldfield has been forced to smash into paper fences in order to get his name into the public prints. Even this is forgotten, however, in all this excitement over the Vanderbilt cup race.

Those makers who announce that not for about a month will samples of their 1906 cars be ready for public inspection might be reminded that other makes are not only on view but are on the road in the hands of purchasers.

In the Minneapolis pack has been discovered a joker which thinks it funny to steal cars and scare the owners. When this joker is discovered some of the angry owners will make him look like a torn deuce.

Foxhall Keene balked at being awarded No. 13 in the Vanderbilt race, so a second drawing was had, the number going to Campbell. Another holler followed and so the Stevens Mercedes will carry a letter Y instead of 13. Of course, none of these drivers are superstitious—they just hate to take any chances on Providence.

Some insurance companies which undertook to knock automobiling because it was thought to be a dangerous pastime might show more forethought by encouraging automobiling and recklessness as an assistant business-getter. Insurance companies will need some help pretty soon if they receive a few more rippings up the back such as some have had of late.

Those carriage makers who held their annual convention in Philadelphia couldn't say too many nice things about the automobile. It is plainly evident that these gentlemen are far-seeing enough to know the side the oily, unctuous substance obtained from cream or milk by churning is applied to the article of food made from flour or meal by moistening, kneading and baking.

JUST LIKE AUTOMOBILE SHOW

Thirty-Third Annual Convention of Carriage Builders' National Association Recognizes Motor Car by Giving It and Its Accessories Prominent Part in Exhibition

Philadelphia, Pa., Oct. 9—The thirty-third annual convention of the Carriage Builders' National Association, in session here Tuesday, Wednesday and Thursday of last week, was chiefly remarkable for the part which the automobile played in its deliberations. Not alone in the papers read and the resulting discussions was the automobile feature prominent, but it was particularly evident in the exhibition of carriage and wagon-building accessories, which filled every inch of space of the big Second Regiment armory drill floor, the sessions of the association being held in one of the big company rooms on the Broad street front. The automobile feature was not allowed to overshadow the carriage in any respect, but the body builders who make and in a few instances exhibit tonneaus; the tire people, who slipped in a few solid and pneumatic automobile tires with the numerous reels of carriage tires; the paint and varnish men, who called attention to the enamels especially designed for motor vehicles; the leather and carriage trimming concerns, whose motor car upholsterings occupied prominent places on their booths; the lamp makers, who sprinkled a few automobile lamps among their other wares; the spring cushion manufacturers, who all prominently displayed tonneau and front seats of various shapes and thicknesses and prices in their exhibits; the makers of tops, whose exhibits and catalogues invariably included the extra-long article called for by the automobile—all helped to give the exhibition the appearance of a display of automobile accessories.

The Cleveland Hardware Co., with one of the largest and most comprehensive exhibits in the show, came out boldly and devoted the entire central section of its display to automobile irons. The Fitch Gear Co., of Rome, N. Y., bearded the lion in his den and bare-facedly exhibited a highly-polished carbureter on a velvet-covered table! And so on throughout the show. The deliberations of the association, which lasted 3 days, were punctured at intervals by references to the relations of the carriage builders to the automobile trade, and the growing necessity of the former cultivating the latter wherever possible, owing to the identity of the two trades, not only in the matter of business, but in the objects they are striving for, such as good roads, uniform freight rates, and other things.

In his address on the opening day, President W. W. Ogden, of Newark, N. J., in the course of his remarks stated the present conditions very plainly to the delegates. He said:

The motor car has rapidly come into prominence during the past decade, and is threatening to compete with the horse-drawn vehicle to a greater or less extent. That the automobile has for the past 2 years especially materially lessened the demand for high class pleasure carriages is admitted on all sides. The enthusiasm of the wealthy and leisure classes for this new form of recreation is general throughout our land and shows no signs of abatement, and the most pronounced opponents of this new claimant for the rights and privileges of the highways are beginning to admit that the automobile has come to stay. The carriage maker has already been called on by the engine builder to equip his motor with durable and luxurious bodies and to upholster and decorate them as long experience has enabled him to do in the production of the finest pleasure carriages, and those who have taken up this new branch of industry have found the demand constantly increasing. The repairs and renovations of all parts of a motor car, with the exception of the engine and driving gear, should be, and usually is done, in the carriage maker's shop.

It would seem, however, that as a rule the carriage trade has been slow to appreciate the advantage of getting in touch with this new and growing industry. The carriage maker and vendor is better equipped to handle every branch of this business, with the exception of the manufacturer of the engine and driving gear supported in its frame, than are enthusiasts without experience in the manufacture and sale of vehicles. In order to do it, they are obliged to equip salesrooms and plants at heavy expense, no better and oftentimes not so well adapted to the purpose as the plant which the carriage maker and vendor already possesses, and could use for this purpose without increased expense, and it would seem to be in the province and power of the carriage trade to share largely in this new industry. I bring this very important subject to your attention in a general way, believing that it will be a subject of debate and discussion in our business session.

The subject of technical education, always meriting our thoughtful consideration, will come before us at this meeting with new interest. The automobile industry demands a high order of skill in designing and constructing bodies and equipment that will endure the strain of high speed, and the vibration caused by engines of high power, combined with the greatest possible elimination of weight and the graceful outline, and luxurious upholstering, and harmonious colors that wealth and fashion are demanding and are willing to pay liberally for. Conference with gentlemen prominent in the National Association of Automobile Manufacturers leads me to believe that they are willing to join with us in enlarging and extending the work of our technical school, if we will provide a special course in designing and constructing automobile bodies, and make provision for a class to be instructed in the best methods of obtaining attractive and harmonious results in color schemes and upholstering. They may be found ready to contribute liberally to the support of our school if these features are provided for. I trust the suggestion will be considered and discussed in our deliberations.

The question of good roads is another important one that has been before us in the past. We have a powerful ally in the National Association of Automobile Manufacturers and the various automobile clubs that have been organized in the various part of the country. They are all enthusiastic and insistent in their demands for better public highways. They are ready and eager to unite with any and all organizations that will further this important work. I recommend that the matter be given due consideration. It might be thought wise that a committee of our association be given power to act with the organization I have alluded to, in securing action on the part of counties, states and the national government for the creation and betterment of public highways.

The report of the executive committee, which was read by Daniel T. Wilson, of New York, its chairman, still further enlarged upon the opportunities afforded the carriage trade by the necessities of the automobile builders. It said:

The advent of the automobile has gradually given to the carriage trade a needed expansion, which is now rapidly growing, and, if fostered, bids fair to add very largely to the total volume of business. Especially is this so with the builders of the highest grade of vehicles, where the expenditures for automobiles have curtailed the purchases of horse-drawn vehicles. By constantly catering to the special needs of automobile owners and encouraging the dealings between carriage builders and the users, as well as the chassis builders, there is no doubt the carriage trade will at last reach its greatest development and prove more profitable by making it possible to run the factories steadily throughout the year. Though seemingly an intricate and new industry, in reality it is no more difficult to make and supply the needed carriage parts than to make a horse-drawn vehicle, and we earnestly urge all to seek this trade—which cannot be properly handled by any but carriage builders. When the great demand is somewhat supplied, the business of both horse-drawn and motor-driven vehicles will supply a steady and satisfactory business, as it has already done in France.

In the same report attention is called to "the splendid work of education and real accomplishment that the automobile manufacturer and user have given to the cause of good roads, to the incalculable benefit of the nation."

The annual banquet, which was held in Horticultural hall, was a huge affair, over 600 covers being laid. Almost every speaker made some reference to the automobile and to the advisability of carriage and motor car builders laboring in unison to gain the ends which are so necessary to the success of each.

While no official action was taken on the report of President Ogden on the proposed coalition between the Carriage Builders' National Association and the National Association of Automobile Manufacturers looking to the establishment of a school for technical education in which the carriage men would be taught the secrets of the motor car makers, while they in turn would instruct their friendly rivals in the secrets of their art, the matter received considerable attention at the banquet. In private conversation the diners discussed the proposition in all its angles, most of them coinciding with President Ogden in his belief that it would be a good thing for all concerned. Taken all in all, this convention is bound to result in good all around. The carriage men have no animosity against the motor people, but show a disposition to put their shoulders to the wheel.

Among the 102 separate exhibits the following were more or less intimately identified with the automobile trade:

Tires and Rubber Accessories—Kokomo Rubber Co., Kokomo, Ind.; Sweet Tire & Rubber Co., Batavia, N. Y.; Hartford Rubber Works Co., Hartford, Conn.; Milwaukee Rubber Works Co., Cudahy, Wis.; Goodyear Tire & Rubber Co., Akron, O.; Consolidated Rubber Tire Co., Akron, O.; Republic Rubber Co., Youngstown, O.; Pennsylvania Rubber Co., Jeanette, Pa.; B. F. Goodrich Co., Akron, O.; Firestone Tire & Rubber Co., Akron, O.; Victor Rubber Co.; Stein Double Cushion Tire Co., Akron, O.

Automobile Leathers and Trimmings—Jacob Gerhab, Philadelphia; John F. Kelly Co., Newark, N. J.; Rutter & Turner, New York city; P. Reilly & Son, Newark, N. J.; Louis Dusenbury.; Fabrikord Co., Newburgh, N. Y.; George Stengel, Inc., Waverly Park, N. Y.; L. C. Chase & Co.; William H. Horstman & Co., Philadelphia; American Patent Leather Co., Newark, N. Atlanta, Ga., was selected for next year's meeting of the association. A. G. Brunsman, of Cincinnati, O., was elected president.

TOURIST TROPHY AFTERMATH

London, Sept. 30—We are still enjoying the aftermath of the Tourist trophy race chiefly out of the mouths of those who did well in it, with disclaimers, dissents and disagreements from those who did not race at all. C. S. Rolls, who no doubt is well pleased, has given his conclusions to the press as follows:

"I see no reason why the Tourist trophy, if properly boomed, should not rival in importance—and even supplant—the Bennett race. Its superiority lies in the important fact that it encourages the production of a type of vehicle which is of interest to the buying public, instead of a more or less freak machine of inordinate horsepower, which is useless—and may be most harmful for ordinary road work. In conclusion, I should add that, looking at the matter simply from the point of view of sport, I am entirely in favor of motor racing in every form, for I personally know of no better sport; but it is idle to suppose that manufacturers who spend thousands of pounds in building and entering for a race do so for the sport of the thing, and, secondly, this is, in my humble opinion, one instance in the history of the English people where the interests of sport do not coincide with the best interests of the movement as a whole."

The following entries have already been received for next year's race. The regulations will undergo a careful examination before they are issued: John S. Napier, Arrol-Johnston; A. Rawlinson, Darracq; A. Rawlinson, Darracq; C. S. Rolls, Rolls-Royce; C. S. Rolls, Rolls-Royce; C. S. Rolls, Minerva; T. B. Browne, James & Browne; C. Harman Wigan, Vinot & Deguingand; D. Citroen, Minerva; Captain W. H. Bennett, Dixi; Cyril C. Maudslay, Maudslay; John S. Napier, Arrol-Johnston; R. Dennis, Dennis; R. Dennis, Dennis; Harry Smith.

EMPIRE REGISTRATIONS GROW

Albany, N. Y., Oct. 7—During the month of September there were 480 cars registered with the secretary of state, which makes the total number registered close to 23,000. The makes of machines leading in the returns were: Cadillac, 45; Pope, 22; Rambler, 20; Oldsmobile, 19; Autocar, 18; Ford, 17; Maxwell, 16; White, 15; Winton, 15; Locomobile, 14; Reo, 14, and Franklin, 11. The leaders among foreign cars were: Panhard, 14; Rochet-Schneider, 13; Renault, 9; Mercedes, 9; Bollee, 6.

FRANCE HAS TO SHOW

John Bull Forces Rival to Take Space in Olympia Exhibition, First of Winter

London, Sept. 30—The final ballot for space at the Olympia show, which opens on Friday, November 17, has been held, and the full list of exhibitors discloses that there are 250 stall holders. Of these 140 are exhibitors of motor cars, thirty-five of which will exhibit French and other continental models. When the Society of British Motor Manufacturers and Traders decided to alter its Olympia show date from February to November, with the avowed object of antedating and so anticipating the Paris motor exhibition, not a few skeptics ridiculed the idea that the Olympia show could possibly have any serious ambitions of rivalling the magnificent display which the French trade annually provided in the Champs Elysees. But the men who proposed to make this not merely an ambition, but a reality, knew better than their critics the conditions under which the whole situation was being moulded. They were neither deceived by the apparent calm with which the French show promoters received the challenge nor disturbed by the derision of critics on their own side of the straits of Dover. They gave it as their opinion that the French and German firms who were working the British market would either have to come over and help to make the Olympia show a spectacular as well as a trading rival to the Paris show or would hand over their British customers to the prior influence of the Olympia show salesmen. The French trade replied in effect and by deputy that their new models would first appear at their own show, which would always continue to attract all foreign buyers as the leading automobile exposition of the world, supported by the trade leaders of every country. That was either bluff or miscalculation, or both. It did not need the all too suggestive statistics of George Prade to prepare the British trade for a change of French trade policy on the subject, for they knew, through the London concessionaires of the leading French concerns, who were prospective exhibitors at Olympia, that they would have 1906 models on view or none at all. As events have now shown, the commercial strategy of the British trade leaders has been wholly successful. Placed on the horns of a dilemma, the French trade has sacrificed dignity to profit, as most people expected that it would do when it came to a showdown.

The 1906 models of Panhard & Levassor, Mors, Richard-Brasier, Gladiator, de Dion, Clement, Talbot, Darracq, Vinot & Deguingand, Berliet, Brouhot, Aster, Germain, Martini, de Dietrich, Peugeot, Minerva, Mercedes, Fiat, Itala, etc., are all promised for the opening of the Olympia show. In this way it receives, somewhat unwillingly no doubt, the cachet for which the British trade has been finessing, and as if to emphasize its victory only one English car firm has officially applied for and obtained space at the Paris salon—Humber & Co., of Nottingham. It is confidently expected that the trading results of Olympia will be such that the French trade will bring forward its show date so as to anticipate Olympia and so the sparring for wind between the two shows will probably prevent an early declaration of dates on either side.

It is, however, quite evident that the Olympia building is entirely inadequate to the consolidated requirements of the British trade and so proposals are on foot to split it into two or possibly three exhibitions, spread over the winter season from early November to early March. The first show would be devoted to pleasure vehicles, so that the continental makers might not draw away British buyers and could themselves have greater show facilities at Olympia. The second would be an industrial and marine motor show and the final a sort of retailers' mart for those who consider that the most suitable time for a motor show is when people are about to restart active motoring—for it is not an all-the-year-round-pastime here.

FOOLISH SORT OF JOKING

Minneapolis, Minn., Oct. 9—Automobile thieves and practical jokers are making life a burden for owners of cars in Minneapolis and St. Paul this fall. During the past month nearly a dozen machines have disappeared from the streets, or have been taken from the private garage of owners, either by thieves or by friends who sought to scare the owner of the car. The most notable disappearance was that of the 50-horsepower Thomas Flyer belonging to C. R. Lamb, of Minneapolis. The car was taken from in front of the Orpheum theater during the evening performance, and Mr. Lamb has been unable to locate it. Police officials of all cities in Minnesota were sent a description of the car, and the first result was the arrest of a Minneapolis dealer who was on his way to North Dakota to deliver a Model car. The dealer, after some trouble, was released. Many of the cars which have been taken have been later found at the outskirts of the city, much the worse for a hard drive. Asa Paine, racing secretary of the Minneapolis club; A. C. Bennett, Northwestern agent for the Winton, and others declare that the machines are taken by practical jokers, who wish to scare the owners. The police have taken the matter in hand, however, and practical joking in that line is expected to be at a discount from now on.

WILL EXCHANGE PRIVILEGES

New York, Oct. 5—Following today's meeting of the directors of the American Automobile Association, announcement was made of the conclusion of arrangements for reciprocal exchange of privileges and use of the touring information bureaus by members of the Touring Club of France, the Automobile Club of Great Britain, the Motor Club of Belgium and the American Automobile Association. The A. A. A. will also have an especially appointed consul in Paris to give touring information to touring members. It is expected that later the German Automobile Club will become a party to the quasi-union.

FIGHTS HIS WAY WEST

Megargel Runs Into Many Difficulties Crossing Wyoming Ditches and Gulches

Arco, Idaho, Oct. 11—Special telegram—The Reo Mountaineer arrived here last night and left for Hailey this morning. We were lost in the desert Sunday in a heavy snow storm and arrived at Pocatello nearly frozen. The weather was milder today. There is thick ice every morning and snow on all the mountain tops. The Reo Mountaineer, after some very severe mountain climbing, during which it certainly made good its name, pulled into Montpelier last Thursday night. During the last days on the road it had been mountaineering from morning until night, last night having been spent at Diamondville, Wyo., one of the highest towns in the Rockies.

Rain that held us up at Bitter Creek for 4 days played havoc with the trail all the way across the state of Wyoming. Huge gulleys or gulches, as they are called here, were washed across the trail, averaging several to the mile. Some of these gulches, directly across our path, were some 20 to 30 feet deep, and we had to shovel a road down their sides and up again, generally making use of the cable to haul the Reo Mountaineer up the almost perpendicular sidewalls. The Reo Mountaineer was the first vehicle to tackle the trail after the rain, passing freighters and emigrants at every station, waiting for the roads to improve before setting out again. At one point we thought we were stuck, for a chasm opened up entirely across the road, some 20 feet deep and about 5 feet wide. After shoveling dirt into this hole for some 2 hours without any visible effect, we drove over to the Union Pacific tracks, 2 miles away, and brought two of the widest ties we could find to the hole. Placing these across the gulch, we cautiously drove the Reo over on the ties. I'll bet it will keep some of the freighters and emigrant outfits guessing how they can get their wagons and horses across this hole without bridging the entire chasm.

Bitter creek is a little stream, naturally—so small, in fact, that I've often wondered how it received a place on the map of Wyoming. We drove the Mountaineer across it just east of the Bitter Creek station on the Union Pacific line, the water in the creek at that point being some 3 inches deep. That night it rained and when we attempted to recross the creek at a point some 6 miles below the station known as Point-of-Rocks, we found quite a different proposition before us. The little creek that we had begrudged a place on the map was then a howling torrent, rushing down between its clay banks, tearing them apart and gouging them out until where an almost dry ford had been the day before some 9 feet of water crossed the trail and barred further progress.

I attempted with hip boots to see how deep it was. A diver's suit would have been more appropriate, I found out a few seconds later as I emerged, dripping wet, after one of the hardest swims in my career. We did find a point where we could jump across, but I'll wager the water at that point, which was only 6 or 7 feet wide, was at least 12 feet deep, and the point where we jumped across was inaccessable for automobiling, even had we been able to bridge the stream. There was nothing to do but camp out on the side of the stream and wait for the water to go down, which we did with the best possible grace, eventually crossing with our cable and windlass in 3 feet of water.

While we have used our cable and windlass several times, we have always managed to attach the end of the cable to a friendly tree, telephone pole or fence post. This was not the case one day last week, and we had to go through the operation of planting a dead man, as it is called in the west. This consists of sinking a piece of timber or bunch of sticks across the road and attaching the cable to the middle, digging a narrow trench for the cable to run in. Fassett dug the grave and didn't get it deep enough, consequently Mr. Dead Man came to life after we had taken a few turns on the windlass. In fact, he came back at us as though he was angry at the idea of being planted. A deeper grave settled him all right and the Reo Mountaineer was soon drawn from an almost bottomless gulch to the top of the embankment.

CAMPING IN A DESERT

SAMPLE OF GRADES ENCOUNTERED BY MEGARGEL

Towns are very scarce in Wyoming and we loaded up with gasoline at Rawlins, carrying enough, we thought, for the 125-mile stretch to Rock Springs. We, however, hadn't figured on the deep sand, gulches to climb and week's layup for low water at Bitter creek, so our tank gave out, with Rock Springs within sight.

All through Wyoming we had to put up at railroad section houses on the Union Pacific line and our meals were composed of canned goods, even the milk being condensed, for no animal can live on the desert tracks, without railroading hay and grain in from some distant point. Now we are in Idaho and there is green grass to be seen once more, for everybody is irrigating and we have irrigation ditches to cross and recross all day. The improvement in the fare, however, is ample compensation for our trouble in this respect. As we are figuring now, it will be about October 15 when we arrive at Portland and some 12 or 15 days later when the Reo Mountaineer gets into San Francisco. There is grave doubts of our getting across the Sierra Nevada mountains before the heavy winter snows set in, but we are going to attempt it at any rate and trust to be back in New York before the first of the year.—PERCY F. MEGARGEL.

LOSING FIGHT BY STURMEY

London, Sept. 30—The Duryea Power Carriage Co., of Coventry, appears to be in a rather bad way. Henry Sturmey, who was the founder of the Autocar newspaper and the father of the British automobile press, has fought a long and a gallant fight for Charles Duryea's car on this side, but he has been beaten to his knees and now appeals through the medium of a letter to one of the financial papers for financial aid to carry on the venture. The story of the British Duryea car is an object lesson in the folly of endeavoring to educate the public. It is at least 6 years since Henry Sturmey determined to abandon all else and push the Duryea car. It was even then a novel design on this side, but it has since became unique. The public here did not take too kindly at any time to the horizontal engine, principally because of its comparative inaccessibility; but the Duryea fared even worse than the other cars marketed with that type of engines. At any rate the commercial progress was so slow that Henry Sturmey considered that it must be due to the prejudice against its foreign construction. He accordingly started to manufacture it in Coventry. He invested all his own capital in laying down the plant and buildings for the purpose of getting the assistance of the big engineering firm of Williams & Robinson of Rugby for parts too havy for his own works. The car has shown up well wherever it has been put into speed competitions and Sturmey has kept it fairly well before the automobile public. But after less than 2 years' trading with the British-built Duryea, the company he founded went into voluntary liquidation with a view to reconstruction. But apparently the proposed reconstruction has not eventuated, hence his present appeal. He asks for any sum from $25,000 to $250,000 and offers as an inducement figures showing the probability of an output of 200 cars per annum. That seems a modest ambition, but it is very doubtful if the appeal will secure the desired result. The constructional side of the motor car indus-

Digitized by Google

try does not seem to attract British investors, although the situation is not quite as bad as it was some short time ago.

The English Duryea car has had considerable success in many countries where it has been used, particularly in the Orient, where a considerable number has been sold. In Japan there are many Duryeas and nothing but praise has come from their owners, so its failure to catch on is attributable to lack of style rather than to mechanical defects.

DUST TRIALS IN ENGLAND

London, Sept. 30—The Automobile Club of Great Britain and Ireland dust trials on the London to Bath road, near Maidenhead, last Saturday have not gone far to aid interests in the manner hoped. The conditions for testing were suitable, a fine stretch of deep natural dust being secured, along which ordinary traffic was also passing as well as the baker's dozen of cars impressed into the club's service. All but one of these were ordinary touring vehicles, ranging in power from the single-cylinder 6 horsepower to the four-cylinder 25 horsepower. One car had special attachments to wheels and under the frame intended to demonstrate that the dust could be prevented from rising, but results did not justify that sanguine view. What was indicated and clearly was that the dust nuisance is largely a matter of speed—and dust. At 15 miles per hour the passing cars did not cause sufficient dust disturbance to make it at all objectionable. At 20 it began to be so, but at 25 miles per hour all the cars threw up dense clouds. In this particular the motorists have furnished some evidence against their own contention that it is imperative that the system of road surfacing now pursued is obsolete and must be amended in the interests of progress. Fifteen miles an hour is a funeral pace for a big-powered motor car driver, but as an alternative to a long and costly alteration of the main roads of the country it is to be feared that everybody else will consider the problem one easy of solution, especially as it will furnish one more reason why motorists should not be allowed to drive at any pace in excess of 20 miles an hour.

GETS M'MURTRY TIMER

Boston, Mass., Oct. 10—The Chronograph Club of Boston has secured the sole and exclusive right to use the McMurtry timing apparatus, which proved so successful at the last Ormond meet, and which has met with the approval of all interested in the accurate timing of motor contests. Mr. McMurtry was in Boston recently and concluded negotiations with President John C. Kerrison which was commenced over a year ago. The club has agreed that the apparatus shall be used only at sanctioned meets, while on the other hand Mr. McMurtry has entered into contract that the apparatus shall be used only with the consent of the local club, and when operated by himself or others delegated by the Boston organization. It is not generally well known, but it is a fact that Mr. McMurtry is the only honorary member of this 12-year-old club.

ODD RACE OF QUAKERS

Fletcher, in Packard, Wins Cross-Country Run of Philadelphia Automobile Club

Philadelphia, Pa., Oct. 9—The annual cross-country run of the Automobile Club of Philadelphia for the Brazier cup was run off last Saturday over a course 109½ miles in length, and was won by G. P. Fletcher, who drove his 28-horsepower Packard over the route in 5 hours 1 minute. There were nine starters, and of these six finished. The course was a four-legged one, with checking points at each corner—at Newton, Norristown, Wilmington and the club house. The affair was a handicap and 5 minutes was allowed to elapse between starts. The first car sent away was Horace Allen's 4-horsepower Oldsmobile, at 8:15 a. m. One hour was allowed the contestants for luncheon, which could be taken anywhere along the route. Although Fletcher has won the cup beyond possibility of a doubt, one of the rules of the run is that none of the contestants shall be warned or apprehended for fast driving under penalty of disqualification. Until reports have been received from every point along the course, the runs and tours committee, which has charge of the event, will reserve its decision. One of the contestants, William Longatreth, driving a 16-horsepower Maxwell, was unfortunate enough to be thrown out of the race for breaking the speed ordinance near Norristown. Two others—E. L. Hawkins, in a 10-horsepower Autocar, and Horace Allen, in a 4-horsepower Oldsmobile—met with accidents near the same place and were compelled to abandon the run. Fletcher, who started at 8:50—next to last—swung into the lead on the next to the last leg, and reached Wilmington, the last checking point, 23 minutes ahead of the second man.

No definite route was laid down for the contestants to follow, the only requirement being that their time cards should be signed by the umpire stationed at each corner of the course. The roads were in fair condition and the weather glorious. The six contestants finished in the following order:

Name	H.P.	Car	Correct time
G. P. Fletcher	28	Packard	5:01:00
J. R. Seeds	15-20	Locomobile	5:41:30
C. W. Kelsey	8	Maxwell	6:04:00
W. M. Swain	24	Winton	6:28:00
C. J. Swain	40-50	Winton	6:42:30
Allan Nood, III	4	Oldsmobile	7:41:30

As usual on the annual race day, there was a smoker in the evening at the club house, at which upwards of 200 members and their friends were present.

NEW TRADE PRACTICE

Buffalo, N. Y., Oct. 7—Swapping automobiles may become as common a practice as hoss-trading used to be if the practices of some Buffalo dealers are followed by others. Comus Penney, who recently became a member of the Jaynes Automobile Co., started out the other day for a drive to Lockport. When about half way to the lock city he met William A. Heacock, of Lockport, driving toward Buffalo. Heacock knew Penney slightly and knew that he had gone into the automobile business. So he took a chance that Penney might be willing to make a trade. They dickered for a time and finally the deal ended with Penney driving back to Buffalo in the machine in which Heacock had started out, while Heacock returned home with a new car. Not to be outdone in respect to quick deals, Ralph Butler, of the Jaynes company's force, started out yesterday to drive to his home in East Aurora. On the way he met Dr. B. D. Shedd, of Arcade, who was driving to Buffalo. The two exchanged greetings and soon dropped into discussion of the merits of their respective cars. Butler telephoned the Jaynes office this evening that he had made a trade with Shedd and the terms he got were approved.

TRADE ASSOCIATION GROWS

New York, Oct. 6—W. H. Baker, general counsel of the National Association of Automobile Dealers, called at the MOTOR AGE eastern office today. In the course of a lengthy conversation on the progress and objects of the association he said: "In the past month our membership has increased from seventy-five to 125, which includes only dealers of recognized standing. We believe that the future prosperity of the business and proper restriction of production will lie largely with such an organization as ours, providing it be properly conducted. We are asking the coöperation of the manufacturers in the creation of a reliable distributing body. Our demands are meeting with recognition. They are not unreasonable. We ask for the prepayment of freight charges, the complete equipment of cars with the sundries necessary to run them and the omission of equipment that belongs more properly to the agent to sell, a rearrangement of the discounts on the basis of business done and the type of car, a more reasonable price for demonstrating cars, a cutting off of discounts to owners banding together to get wholesale discount, and that the smaller dealers be compelled to take subagencies from the larger dealers. We demand of the tire companies that they leave to us the selling of tires. We want makers to be bound to make the deliveries they contract for and that the dealer in return be compelled to accept all cars for which he may have contracted. Makers are becoming convinced that what we ask is reasonable and that we are factors in their business, worthy of help and encouragement."

DEWAR RACE NEXT WEEK

New York, Oct. 11—The entries of the Ford, Christie and Thomas cars and at least one of the Darracqs is assured for the Dewar cup race, which will be run over the trotting speedway mile on the Coney Island boulevard next Wednesday morning. The Fiat directors are to discuss today making an entry. Charles Heineman is willing to start the Ross steamer, the holder of the cup, if a driver can be found for it. Joe Nelson is under consideration. When the Vanderbilt race is over it is expected that the European cracks will be ready to consider competition for the cup. They are too busy now to talk anything but Vanderbilt race.

The Realm of the Commercial Car

An Atlantic Coast Motor Tally-Ho

SUMMER RESORT TALLY-HO

THE MOTOR Tally-Ho Co., of New York, is one of the leading concerns devoting its exclusive efforts to running pleasure automobiles between the many summer resorts in New Jersey and along the Atlantic coast. The observation cars used by the company are large sixteen to twenty-four passenger vehicles, provided with enclosed seating space or canopy tops, as the occasion demands. Two of the observation routes conducted by it are the Asbury Park route along the New Jersey coast and the other a run from Philadelphia through New Jersey to Atlantic City. The former route has been used since 1904, but the latter is new, it being scarcely a month since the first car commenced regular trips. To be abreast with the times and make the running of observation machines an all-the-year-round business the Motor Tally-Ho Co. operates its machines in the winter season in and around New Orleans and on the Florida routes, where the popularity of the big twenty-passenger machine is as great, if not more so, than along the better known northern shore points. The machines used on all of the routes are known as the Manhattans and are built by the Mack Bros. Motor Co., of Allentown, Pa.

Since the first placing of the first car at Asbury Park, a little more than a year ago, and the subsequent rushing of two others in response to the feverish message, "Send more cars as soon as possible; we can't handle the crowd!" the success of the Motor Tally-Ho Co. has been a surprise. Breakdowns were frequent in those early days at Asbury Park. They always came at the most unfortunate moment. Scores of people were often turned away after reluctantly receiving their money back; or, worse, stranded on a country road and ingloriously towed to their destination or sent home on the train. In spite of these drawbacks, however, the enterprise flourished; and during the short Asbury Park season of 6 weeks, the three cars, each holding from twelve to fourteen persons, carried no fewer than 5,518 summer visitors to Long Branch, Spring Lake, Sea Girt and Lakewood. This is a round trip of 45 miles, through wooded roads and farming lands; and gives an opportunity to such as desire it to inspect the estate of George Gould. The way back to Asbury Park runs through the deserted village of Allaire, a romantic spot, once the home of some 5,000 busy workmen and their families. Here was the Allaire Iron Works, which did an enormous business until the discovery of the Pennsylvania coal fields brought about the wholesale desertion of business and dwelling houses, which makes the village one of the show places of that region today.

Three hours are allowed for this Lakewood trip; this includes a rest of ½ hour; for although the cars have a maximum speed of from 30 to 35 miles an hour, it is not considered desirable, for purposes of observation, to go so fast. They average from 15 to 20 miles an hour on the regular trips, and there seems to have been no desire for more rapid motion on the part of the passengers. Charter parties have been an important feature of this season's work, and there were days when three and four cars were engaged in this way by persons preferring to ride with their friends rather than with strangers on the regular trips.

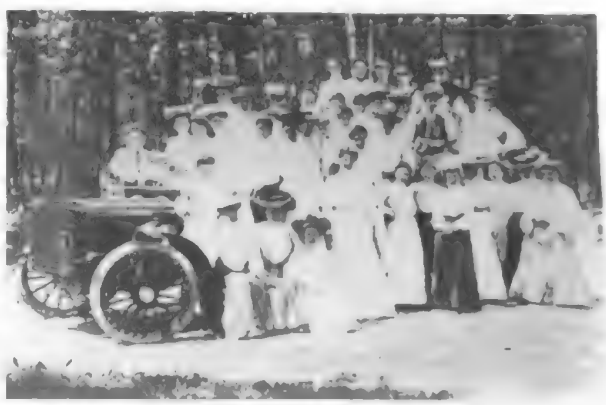
The cars have 60-horsepower motors, and carry fourteen people comfortably. They run smothly and can be relied on to make a long journey without mishap. The writer recently had the good fortune to take the 60-mile run from Philadelphia to Atlantic City, and on the following day the 100-mile trip from Atlantic City to Asbury Park. The performance of the cars on both occasions was admirable. They maintained an average speed of 15 miles an hour and ran through without a hitch of any kind. The ride from Atlantic City to Asbury Park was particularly enjoyable. The road nearly the entire distance lies along the coast; through cozy villages and thriving towns, where the leisure populace turns out in large numbers to view the big automobiles; past prosperous farms, and fragrant groves of pine and scrub oak. Then come the salt marshes, always a delight to the artistically constituted person. A stop is made at Toms river for dinner, where an excellent meal is to be had at a reasonable price. Thus rested and refreshed the remainder of the journey is accomplished without fatigue.

The president and general manager of the Motor Tally-Ho Co. is George H. Wright. Willis H. Heath is the treasurer. The main office is in the Flatiron building at Twenty-third street and Broadway, New York. The men who operate these large machines are selected with great care, and are necessarily intelligent and resourceful, both as drivers and mechanics. During 15 months of almost continuous running the company has not had an accident. By accident is meant any mishap that could place the lives of passengers in jeopardy for a single instant.

As to the operation of these cars, the management has furnished the following facts: The amount of gasoline consumed is ⅓ gallon per mile, and the average cost of operation, including work on repairs, 9⅓ cents per mile. This does not include the cost of duplicate parts, such as tires, which, by the way, are of solid rubber, since the weight of the machines is about 6,000 pounds. The tires are made by the Hartford Rubber Co., and are 4½ and 5-inch Turner Standard B, 36 inches outside diameter. The cars run on an average 110 miles each a day; the maximum distance covered by any one car in one day being 160 miles.

During the New Orleans season—from December to April—three cars ran 9,954 miles and carried 8,456 people, while this season in Asbury Park shows a record of 10,813 miles and 7,067 people carried. Directly on their return from New Orleans and before the opening of the Asbury Park season, they ran 5,131 miles and carried 7,320 passengers in Brooklyn.

The Cuba Motor Tally-Ho Co., an offshoot of this company, is now operating Manhattan cars similar to those used in Asbury Park between Havana and Gueries and also from Havana to Guanajag, as well as in the city of Matanzas. This company, which is under the management of C. E. Codd, has an order placed with the Mack Bros. for ten more cars of the same size and design, which they will place in Cienfuegos, Remedios and Caberien. They are also putting six 5-ton trucks on the road



A Motor Tally-Ho's Load

Digitized by Google

for handling pineapples and milk around Havana. Special freight carrying bodies necessary for such work are required, but in all other details the construction will be identical with that of the observation machine and the strength of all parts well proportioned.

After a week's operation, with the most delightful weather conditions imaginable, the new automobile stage line running between Philadelphia and Atlantic City has leaped into popularity at a bound, and places on the single car, the Manhattan, now running must be booked several days in advance. The time schedule calls for shoreward trips, starting from the Bellevue-Stratford in Philadelphia at 9:30 a. m. Tuesdays, Thursdays and Saturdays. Return trips are made on Mondays, Wednesdays and Fridays, starting from Hotel Chalfonte, Atlantic City, at the same hour. During the past week the car's full capacity of twenty passengers has always been taxed, with an overflow which must content itself with future bookings.

The Manhattan's frame is built of channel steel 5 inches deep, and the wheel base measures 12 feet, with wheels of the Sarven patent, 2-inch spokes, and equipped with 4½-inch solid Turner endless tires, which the Mack company, the builder, has decided best meets the requirements for heavy cars designed for passenger service. The springs are half-elliptic, of Swedish oil-tempered steel made especially to carry the load. The four-cylinder vertical motor has a 6-inch stroke, with a 5½-inch bore. The crank case is of aluminum, the saft itself being made of the best nickel steel. The valves, all on one side, are drop-forged nickel steel, both inlet and exhaust being of the same size and all interchangeable. The ignition is by the Remy jump-spark magneto, with dry cells for starting only.

The sliding gear transmission is of entirely new construction, with three speeds forward and reverse; the gears are made of chrome nickel steel, and the drive is direct on the high gear on the mainshaft. The bearings on the axle and countershaft are of the Timken roller type. The bearings on the transmission are made by the Hess-Bright Co., and are similar to those used on Mercedes, Panhard and many other large foreign touring cars. The carbureter is of the new Holley pattern, while the circulating pump, of the centrifugal type, is peculiar to the Mack cars and is made after the company's own designs. The force-feed oilers are mechanically operated. The clutch is of the conical type, leather covered, 17 inches in diameter and controlled with the regular French system; all foot levers and hand levers interlocking with the clutch. The differential, of the bevel gear type, has the countershaft riveted to master gears solidly enclosed. The chain is of the Whitney roller pattern, 1½-inch pitch. There is an emergency brake on each rear hub, besides two on the countershaft. The radiator is of the copper tube disk type, with fan for circulation, the bonnet being of steel with trimmings of brass.

The body is designed to carry twenty passengers—four on the front seat, five each on the second and third and six in the tonneau. The speed of the motor is normally 1,000 revolutions per minute, and at this rate the car is geared to do 18.7 miles per hour; this speed can be maintained with a full load over the generally level roads between Philadelphia and Atlantic City. A speed of 30 miles per hour is possible under the most favorable conditions, while on a 25 per cent grade 6 miles an hour can be made on the low gear; an 8 per cent grade can be taken on the high gear with twenty passengers aboard. The 24-gallon tank contains sufficient for a 120-mile run over ordinary country roads, it having been demonstrated that the fuel consumption averages just about 1 gallon for each 5 miles. The consumption of cylinder oil on the same basis will approximate ½ gallon and machine oil 1 quart.

One of the Cars as it Appears When Empty

During the past week a careful record has been kept of the operating cost, with the following result, on the 100-mile basis:

Gasoline, 20 gallons at 15c	$ 3.00
Cylinder oil and grease	.60
Wear of rubber tires, estimated at 2½c per mile	2.50
Housing, cleaning and care of car	2.00
Operator's wages, etc.	3.00
Total cost per 100 miles	$11.10

The Mack company, whose plant is located at Allentown, Pa., about 60 miles north of Philadelphia, has built fifty-one of these large gasoline passenger buses—thirty-four in the past 12 months—and all of them are still in operation. In addition to its passenger cars it has built and delivered several safe and brewery trucks, railroad cars and delivery wagons, besides separate engines for motor boats and automobiles.

GERMAN POSTAL PROGRESS

Germany leads all other countries in the use of motor wagons for covering postal routes in her great cities and for her leading postal routes in rural districts. This is due mostly to the poor railroad service given in many parts of the country. In these districts horse stages have been relied upon for years to deliver and collect the mails. The urgent calls for faster service, coming as they have from all parts of the country, have, however, led the postal authorities to make special tests with motor wagons. These tests have been under way for several months, until now the authorities, after reports made by their technical experts who followed the tests, have purchased a few machines for regular use.

The machines under test are not restricted to any form of power. Gasoline, alcohol and benzine motors, however, were preferred. Steam and electric machines were not discouraged. Of the three classes—gasoline, alcohol and benzine—perhaps alcohol was most favorably considered, partly because of the greater expense of gasoline and the home production of alcohol from vegetables, making it the cheapest and most convenient. Alcohol has been experimented with for a few years and now carbureters have been made for its use in which it offers no greater difficulties than ordinary gasoline.

The machine favored by the postal authorities and the latest to be purchased is an 8-horsepower N. A. G. motor van designed to carry a load of 3,300 pounds. Before making the final purchase a special test of 10 days was given the machine, in which it showed up to great advantage both in economy of fuel, load carrying and ease of control. The speed feature, being restricted to 12 miles per hour, did not enter largely into the test. The machine was manufactured at the factory of the Neue Automobil Gesellschaft, of Berlin, and is a regular stock chassis, fitted with specially made body answering the requirements of the postal department. The motor has two vertical cylinders mounted beneath a very short bonnet in front of the footboard, a cellular radiator forming the forward end of the bonnet. The fly wheel is practically beneath the forward part of the footboard. The sliding gear case is beneath the removable board of the footboard. Drive from the gear case is through a short shaft to the countershaft, on the ends of which are sprockets for double side chain drive. The braking system includes regular lever-applied emergency brakes on the rear hubs and pedal-applied ones on the drive shaft in the rear of the gear case. The steering wheel is on the top of a vertical column and carries on it spark and throttle control, as well as the change-speed lever, the only side lever being the emergency brake one.

The carrying compartment resembles a small undertaker's wagon with plain, tightly closed sides and a rear entrance. It is much higher than the head of the driver and the front end forms the back of the operator's seat. The body is made weather and fireproof, the latter used as an extra precaution. For work in rough districts sprags are dropped from the centers of the side pieces of the frame and can be raised or lowered at will from the seat. A further precaution is added in shoe brakes applied to the rear tires as well as the regular hub ones. The running gear is strongly made, being intended for heavy service and long life. Artillery wood wheels, the front ones of medium weight and the rear ones very heavily constructed, are used. On both are heavy solid rubber tires with smooth tread. The double rubber tire is being fitted to a few

Digitized by Google

NEW RECO TEN-PASSENGER MOTOR BUS

machines, but the pneumatic has been resolutely ruled against.

At the present time the Berlin authorities are also experimenting with a type of 3-wheel machine for use over light routes in the cities. The machine has a carrying capacity of 200 pounds and is propelled by a 3-horsepower motor. The carrying box is in front of the driver, who sits high and well to the rear, leaving the motor and carrying capacity well in front of him. Part of the work of these three-wheelers is the carrying of the mails from the main postoffice to the city branches. So great has been the success attending their use that the authorities hope to remove all horse vehicles and use the motors instead. This type of vehicle, while light in weight and cheap in maintenance, has good speed and carrying capacity.

MOTOR FIRE ENGINE

Will the large, cumbrous, rattling fire engine be replaced by small gasoline motors mounted on little two-wheel carriages that can be pulled along by a couple of men and taken in places where the big horse machines could never reach? This seems to be no pipe dream at the present moment, for an English factory has brought out its first little wonder in the shape of a single cylinder gasoline motor mounted vertically on the front of a cart, and behind it, and connected up, is a rotary pump with connection for rubber hose from the hydrants and other to the hose for conducting the water to the flames. The whole outfit is little higher than a small boy and is drawn by a pole with end cross-piece, which can be taken hold of by either two or four men and the motor drawn at a fast run to the scene of the fire. Where the blaze is on the ground floor and has not attained headway before the arrival of the miniature brigade, the little wonder can cope successfully with the fire, but where headway has been made little can be done. The scope of such a fire engine is in crowded parts of cities where they can be installed by private concerns, the cost of purchase being little and the method of operation as simple as a chemical engine. It would be possible for a firm of any standing to have one or more in its place and several employes capable of running it. The motor is an 8-horsepower de Dion, the weight of the outfit is 360 pounds, and it will throw a stream of water to a height of 59 feet. With the motor running at normal speed the discharge pressure is 90 pounds per square inch and the output 20 cubic meters per hour. As yet this motor fire engine has not come into general use, but those who have seen demonstrations of this useful little machine predict for it great possibilities when its practicability is generally understood by the property owners, whose interests it is designed to conserve.

AN ACME DEMONSTRATION

Carson, Pirie, Scott & Co., one of Chicago's largest retail merchandise houses, made a 3-day demonstration recently with an Acme delivery wagon. The machine used was the two-cylinder machine recently described in MOTOR AGE. On October 3, 4 and 5 the demonstration was made. On October 3 the first load left the store at 9:15 on the South Park route, carrying 108 packages. The assistant shipping clerk, a regular wagon driver, and package boy accompanied the car, in addition to the regular driver of the machine. The route of delivery covered that territory from Sixty-first street to Seventy-fifth street on the south, and Stony Island avenue to Wentworth avenue on the west. The entire load was delivered at 1:10 and the wagon had returned to the store at 1:45 for the second load, which left the store at 3 o'clock with thirty-seven packages, covering the same territory as the first load in the morning. The entire load was delivered and the car returned to the store at 6. On these two trips the amount of gasoline consumed was 7 gallons and ¼ pint of lubricating oil.

On October 4 it started from the store at 12:30 on the Oak Park route with 130 packages. It arrived at Oak Park at 1. The territory covered was Oak Park, Harlem, River Forest, from Twelfth street, to North avenue, on the north, and Austin avenue to the Desplaines river on the west. The delivery was made and the car returned to the store at 6:30. The amount of gasoline consumed was 6 gallons and ½ pint of lubricating oil.

On October 5 the first load left the store at 9:15 with 124 packages, on the northern trip, arriving at Devon and Evanston avenues, the first stop, at 10:15. The territory covered comprised that lying from Lake Michigan to Bennett avenue on the west, and from Devon avenue to Central avenue on the north. The complete delivery of the load was at 1:45. The second load started from the Evanston barn, Chicago avenue and Main street, at 4:20 with thirty-one packages, covering the same territory as the morning route. The delivery was completed at 5:45. The amount of gasoline consumed was 9 gallons, and 1 pint of lubricating oil. Time could have been saved in delivering the second load by the return of the machine to the store instead of the long wait made necessary in sending the parcels for the second load to Evanston by train, to be distributed from the Evanston barn. In all the gasoline used was 22 gallons, costing $2.31, and the lubricating oil 1¾ pints, costing 14 cents, or a total of $2.45. The total number of packages delivered was 480, and the mileage covered during 3 days' demonstration was 158 miles, at an average speed per hour of 9½ miles, which is considered good going.

GERMAN POSTAL TRICYCLE

NEW RECO BUS

The Reo Motor Car Co., of Lansing, Mich., with its usual energy has come to the front with a ten-passenger motor bus. Chassis construction is featured by the use of pressed steel side pieces, curving downward in front, where the spring hangers for the semi-elliptic springs are secured. The rear part of the frame is carried on full elliptic springs, radius rods extending from midway of the side pieces of the frame to the rear axle casing. Tubular axle construction is used and the axles run on roller bearings. The weight of the bus approximates, with canopy top, 1,700 pounds; the wheel base is 90 inches and the tread 55.

The power is supplied from a two-cylinder opposed motor of Reo construction, suspended lengthwise of the frame and with a bore and stroke of 4¾ by 6 inches, respectively, rated at 16 horsepower at normal speed. It is the 1906 motor of the Reo touring car. A special adjustable friction clutch serves to connect the gear with the crankshaft. Drive on the high speed is direct, the maximum speeds ranging between 18 and 24 miles per hour. Ignition is by jump spark, with current from either of two sets of dry battery. The gasoline and water supplies are 13 and 3½ gallons, respectively. The bus body is typical in with a central aisle and rear in every sense. The driver, with a couple of passengers, occupies the cross front seat and behind it are two facing side seats, with a central aisle and rear entrance.

Digitized by Google

COMMERCIAL STEPPING STONES

Better Than Trolley Line—The establishment of a motor bus line is talked of from the center of New Bedford, Mass., to Buttonwood park, one of its leading suburbs. An electric line has often been talked for over the same route, but the people have objected to the laying of the tracks along the streets.

Another Undertaker In—Syracuse, N. Y., undertakers are all lining up with motor propelled ambulances. Undertaker McCarthy uses a gasoline one and now a competitor, William P. Hart, has arranged for the installation of an electric one. Horse ambulances are used by the latter, but the field of the electric is for long runs. The vehicle will cost $3,000.

Another Railroad in Line—O. J. Collman, general manager of the Kansas Southern & Gulf Railroad, is responsible for the statement that as soon as the construction of the line is completed it will be equipped with gasoline motor cars for passenger service. Because of the high speed of the motor cars it will be possible to make four round trips each day between Blaine and Alma, the former in Pottawatomie and the latter in Wabaunsee county, Kansas.

Wideawake Boniface—The enterprising proprietor of the Marshall house, York Harbor, Me., owns a Knox bus for transferring passengers to and from the railroad depots. The wagon has facing side seats with center aisle and rear entrance. In warm weather a top of the folding variety is used, the sides, front and end being rolled up, but in wet weather, when down, it can be transformed into an enclosed car, with the large tarpaulin windows furnishing sufficient light for the passengers to read with ease on dull days, if they are so inclined. Travelers are much taken with the new line, one well known drummer giving vent to his approbation recently, remarked: "Good-bye Dobbin and welcome motor. The change has not come a minute too soon. Who wants to ride in a slow, shaking horse bus when a smooth-running, speedy automobile is better in every way?" The fares charged by the bus is not more than that with horse vehicles, but the

Scots Find Good Use for Motor Wagons

greater loads carried, faster time made and longer hours of daily use are the money savers in connection with them.

Is Now Consistent—The Pope Mfg. Co., of Hartford, Conn., in order to be consistent, as all automobile manufacturers should be, has commenced the use of automobiles in transporting goods between railroad depots and the factory. A light electric machine is used for carrying the lighter freight pieces and a big electric truck for the heavy parts.

Glasgow a Devotee—Glasgow, Scotland, not only believes in municipal ownership, but is also a devotee of the motor bus and motor wagon. The city corporation has recently purchased an Arrol-Johnston, 12-horsepower motor tower-wagon for repairing breaks in the overhead trolley wires. The motor is a two-cylinder one, working at 800 revolutions per minute. The gear box carries gears for four forward speeds and a reverse, with final drive by double side chains. The forward speeds range from 1 to 16 miles per hour. Noticeable features of the machine are roller bearings, phosphor bronze hubs for the road wheels, solid tires, irreversible steering gear, forced feed lubrication, and magneto ignition.

Use Steam Wagon—James B. Clow & Sons, Chicago, Ill., are using a Coultard steam wagon in delivering iron and tile piping from their yards to all parts of the city. The machine has a 30-horsepower motor and is capable of making 10 miles an hour with a heavy load. Two hundred gallons of water capacity is provided and coke furnishes the heat.

Has Regular Time Table—The bi-daily automobile service between the Bellevue-Stratford hotel, Philadelphia, and Atlantic City, N. J., has been started. Regular trips are made from Philadelphia on Tuesdays, Thursdays and Saturdays, leaving the hotel at 2 o'clock. The machines leave the Chalfonte hotel, Atlantic City, at the same hour on Mondays, Wednesdays and Fridays.

Making Demonstration—The Pardee-Ullmann Co., Chicago, distributors for the Packard car, has been making demonstrations with the Packard truck for several stock yard concerns within the last month. Swift & Co. were given a 5-day demonstration and the Anglo-American Packing and Provision Co. a 7-day trial. The truck was used in delivering meat to the companies' branches around the city.

Educates Operators—The London General Omnibus Co., of London, Eng., is wrestling bravely with the driver proposition by having all of its drivers take courses at the Battersea Polytechnic Institute. Relief days are provided each week, when the drivers take several hours off to attend instruction, pay being given for lesson periods. The company deserves praise for its determination to give the motor bus a fair deal by endeavoring to place it under the care of competent operators. The saving in the maintenance bill is being eagerly followed by the directors and already the direction in which the wind blows can be seen by the fewer breakdowns recorded and the diminishing of the number of accidents.

Motoring Honeymoon Tour of Father and Son

A Crowd Watched the Start from the Grand Hotel at Lyons

NO person can conceive of a more delightful wedding trip than that taken during the early summer by New York state's ex-lieutenant governor, Timothy L. Woodruff, and his bride, and his son, John W. Woodruff, and his bride. It is permitted to but few fortunate newly married couples to spend their honeymoon automobiling through France, Switzerland, Austria, Germany and Belgium, as did the Woodruffs, who took this beautiful trip just when everything was at its prettiest and the roads, always smooth, at their smoothest. Mr. Woodruff, while nominally a resident of Brooklyn, has a home in Syracuse, where he is president of the Smith-Premier Typewriter Co. and spends most of his time in that city when he is not mixed up in politics. The trip had been planned a long time before the Woodruffs were married. In fact the car, a Fiat, was especially built for them in Italy and shipped to France, where they met it. Mr. Woodruff had run a Fiat car about New York city and had decided that it was just the machine in which to make a tour through Europe. He sent his chauffeur, Candido Bastianello, an Italian, over ahead of the party to superintend the preparation of the machine and to get it thoroughly tested out preparatory to having it shipped to Paris. There was not a breakdown during the 27 days of the tour, in which something like 3,000 miles were covered at a good rattling pace. It was not the intention of the tourists to see how fast they could go, but rather to enjoy the beautiful scenery and to gain the rosy health which can only be secured by such a trip. The party would have taken much longer for the journey had not business engagements been pressing. A hot campaign in New York, too, required the presence of Mr. Woodruff. In public life Mr. Woodruff is the boss of Brooklyn, but in private life he is a plain, congenial gentleman. Before starting the story of the trip it might be well to tell how near he came to being president of the United States. He was a candidate for vice president the second time William McKinley was nominated for president. Owing to the insistence of the republican leaders that Theodore Roosevelt be sidetracked by forcing him to take the nomination, Mr. Woodruff was left out. What happened later is well known. President McKinley was assassinated and the vice president became president. Had not the leaders wanted Roosevelt out of the way, Mr. Woodruff might have been vice president and consequently president. Mr. Woodruff now has his eyes upon the governorship of the Empire state.

Shortly after the weddings, the Woodruffs sailed for England, having made all the preparations in advance for the car and for the details of the tour. Two delightful weeks previous to July 1 were spent in England, where the party was entertained by Sir Thomas Lipton, whose penchant for yacht racing has made his name famous in America. Mr. Woodruff had entertained the noted tea merchant at his lodge in the Adirondacks several times and a strong friendship had sprung up between them. Accordingly, as soon as Sir Thomas found out that the Woodruffs were in England, he made elaborate preparations to entertain them. He took

Repairing a Puncture

the party from London to Southampton, where his big yacht, Erin, was anchored and there the party remained for the next 3 nights, the days being spent in touring through southern England in Sir Thomas' 60-horsepower Daimler car. The famous New Forest and other trips in southern England were taken. The party found the roads as good as those traversed later in France, although they were narrower and dangerous on the turns. The weather was delightful and every member of the party thoroughly enjoyed the little side trips from Southampton. Sir Thomas proved to be a royal entertainer.

The Americans started for Paris about July 1 and here they were met by Candido, the chauffeur with the big Fiat car, which developed 43 horsepower. A temporary body had been placed on the car, the manufacturers finding it impossible to get out the finished product in time. It did nicely, however, for the trip and upon the completion of the tour the car was sent back for the permanent body and will be shipped to this country, where Mr. Woodruff will run it in New York. After doing Paris and taking in the points of interest

Motorists Sightseeing in the Alps of Switzerland

Digitized by Google

usually visited by tourists, a courier maid was engaged to go ahead with the trunks and to arrange for the hotel accommodations at the various stopping points. The first two days in France were spent in visiting the famous chateaus. One of the most famous of the chateaus visited was the Chateau Chambord, built by Francis I and one of the finest in France. On the way to Lyons the party took in the Bennett race. From Lyons the party went to Geneva and crossed the Alps of Switzerland, going over the highest mountain passes easily. Of this Mr. Woodruff says: "We crossed the Alps at a speed equal to if not in excess of that attained on a level in America, where the roads are a disgrace to our civilization. Too much cannot be said in praise of the European roads. Like a city pavement the roads are before you—smooth as asphalt. We traveled the roads built centuries ago, which are in just as good condition today as when they were first built. The secret is that they are properly maintained. What America must wake up to is to build good roads in the first place and then spend enough money on them to properly maintain them. We noticed with great interest the men whose

Shoveling Snow on the Jungfrau

duty it was to travel over the roads and to fill in the least bit of scratch, keeping them in absolute repair."

Mr. Woodruff, Jr., was the official photographer and succeeded in catching a characteristic snap-shot on the road from Bagas to Innsbruck. No inns being in the vicinity, the party enjoyed a meal in the open air. The two women and T. Woodruff, Sr., were on the ground, and the chauffeur was standing in the background. A strange picture was taken of the women of the party shoveling the snow of the Jungfrau. Mrs. John W. Woodruff wielded the shovel while Mrs. Timothy L. had her hand raised to throw a snowball at the camera artist. The sun was shining hot in the valleys, while on the heights the snow made the party think of winter.

En route from Austria to Berlin the party spent a day at Munich and after 3 days' sightseeing among such interesting places as Nuremberg, Rothenberg, Stuttgart, Baden-Baden, Heidelberg and Dahmstadt, reached Frankfort-on-the-Main. In Rothenberg the weather was decidedly frosty and the party had to bundle up as if in the dead of winter. Three and four

Woodruff Party Dressed for a Chilly Ride Out of Rothenberg

overcoats were necessary to keep warm. From Frankfort the party went to Berlin and from there to Cologne, thence to Brussels by the way of Leige.

"The run from Leige to Brussels," says Mr. Woodruff, "was over a Belgian block road. Over there a Belgian block road is a cobblestone road, while here it is really a block pavement. We reached Brussels at 3 o'clock in the morning, the only bad experience we had with either roads or car during the entire trip. Considering the good luck we had on the rest of the tour, it does not become me to say much about that little experience."

From Brussels the party journeyed back to Paris, having been gone 27 days and having covered 3,000 miles without accident. Plenty of tires were carried along and the machine was never seriously delayed on this account. It is interesting to note that during the trip the tires received fourteen punctures. While the tourists made no effort at speed, no car passed them during the entire trip. They saw many American tourists abroad taking advantage of the good roads and the beautiful scenery. Mr. Woodruff, Sr., since his return home, has been bemoaning his luck in having to cut short his honeymoon in this manner. The 27 days on the road passed all too quickly for the party, and the few discomforts they encountered in the way of tire troubles and cold weather in Rothenberg was more than made up to them by the grand roads they had to travel over and the magnificent scenery upon which they were permitted to feast their eyes. So delighted are the Woodruffs with the joys of automobile touring that it is more than probable that another summer will find them again hiking across the pond for more touring of this sort, or else go west in their own country and investigate the beauties of Yellowstone park and incidentally get a chance to compare the roads of America with the highways of Europe. Anyway, the Woodruffs enjoyed touring.

Picnic Lunch on Road from Pagasto

Digitized by Google

ROADSIDE TROUBLES

An Ounce of Prevention

Copyrighted by the American Motor League

By Chas. E. Duryea

GENERAL HINTS — Axle Seized—A dry wheel or axle bearing will sometimes begin to cut its metal surfaces and seize so tightly as to prevent turning. The first evidence is lessened speed and apparently lessened power. If the metal particles can get away promptly enough, the bearing simply wears out very rapidly. A stop should be made at once and oil applied, the thinner the better, which will probably stop further cutting. The bearing should be taken apart, all loose particles removed and the rough spots smoothed with a file. If hard spots are found projecting above the surface, they must be cut out with a chisel, if they are too hard for a file, as is sometimes the case. The same procedure applies to any other bearing, of course. Bearings should always be perceptibly loose; tight bearings give trouble.

BACK FIRING—This is of two kinds. Properly it means firing in the tube leading from the carbureter and is usually caused by a sluggish inlet valve, a very defective inlet valve seat, a spark occurring during the suction stroke or ignition during the suction stroke, either from some red hot part or from the exhaust of another cylinder through an open exhaust valve. Find and correct the cause. A premature explosion resulting in a backward kick is usually due to the spark too far advanced and should be called premature firing.

BUZZING OF THE COIL—The coil should buzz only when the spark is wanted, and constant buzzing indicates a short circuit. Its cause should be found at once, for it is an indication that the batteries are being damaged. If the coil does not buzz it indicates no current, either because of weak battery or broken wiring.

BAD BATTERY—Lack of vim is very frequently due to a weak spark and should be taken as an indication that a new battery is needed. Where batteries alone are used, two sets should always be carried and their condition tested by throwing in the other set frequently. After both sets have become weak, they may be used together and will give a considerably lengthened service. Some users carry twelve to sixteen cells at a time, using four at a time when fresh, eight at a time when older, and testing out the worst ones occasionally to be replaced by a set of four fresh cells. The 2½ by 6-inch cell can be found at most telephone stations and because of its great availability is really the best size to use. It is also lower in price and lower in weight, as compared with the service rendered, than the larger cell.

MISSING FIRE—Missing fire is evidence of a weak spark and these misfires are sometimes evidenced by explosions in the muffler. A faulty connection, a loose wire, a short circuit, a dirty vibrator may be responsible for bad results from a battery. Where but one set is used a few minutes rest will sometimes recuperate them enough to start the vehicle again. A single bad cell in a series will prevent proper action of the remainder and its removal will often permit the remaining cells to do the work. An ammeter is best for testing, although a voltmeter is often used.

BEARINGS — Plain bearings have been treated under the heading of axles. Ball and roller bearings will indicate the presence of some disturbing feature, such as a broken ball, by grinding or squeaking, and if very dry will, sometimes, grind when oil only is needed. About the motor lack of adjustment is usually indicated by pounding and while this is rarely serious when first heard, it should be remedied before it is allowed to become annoying, for constant pounding will, sooner or later, break a shaft or do some similar damage. Plenty of heavy oil will lessen, by filling the spaces, and pound may indicate a lack of oil.

BRAKE TROUBLES—These are usually indicated by failure of the brake to properly hold or by the brake surface seizing and holding too fiercely. In the former event one is liable to run into something through lack of control. In the latter the vehicle may be damaged by the sudden stoppage, to say nothing of the wearing out and destruction of the brake surfaces. Apply, in one instance, common chalk or dry earth to make the surfaces hold better, or adjust the brake, if needed. In the other instance, apply a little oil or graphite. Carefully inspect all operating parts to see that nothing prevents them from having proper movement to operate the brake. Worn or broken parts, of course, must be replaced promptly, for next to the ability to go, is the ability to stop when desired. It is not enough to know that the brake will hold properly in one direction, for it should be known also that it will hold in the other. Severe accidents have occurred through lack of this precaution. Sometimes one end of the band is greasy and the other end dry, which will explain such eccentricity. The grease can frequently be removed by washing with gasoline, but care should be taken that whatever is used does not get into other wearing surfaces, for gasoline, sand and dirt are as detrimental to bearing surfaces as they are advantageous to slipping brakes. It is not advisable to use resin, although this is common practice. Resin, when cold, grips fiercely, but as soon as warmed up it serves as a lubricant and is decidedly objectionable. It is also adhesive and a resined band will sometimes stick and refuse to let go, which, of course, stalls the motor and causes trouble. It is particularly objectionable on long hills, for a brake holding well at the top refuses to hold when it gets hot, leaving one a victim of misplaced confidence. Sometimes the brake lining is worn until the metal comes in contact, which, having less friction than the leather or fiber lining, refuses to hold, or the adjustment may be at its limit, so that the band cannot be actuated further in order to do its work. In these cases a new lining is required, but temporary service can be sometimes had by inserting visiting cards or similar filling behind the lining.

BUMPING—A sensation as of running over a small obstacle at frequent intervals, producing a decided bump, is usually evidence of a deflated tire, in which the air tube has crept and formed a knot at the valve tube. If the deflation is not noticed until the bump is felt, as frequently happens, the valve tube is likely to be torn nearly or quite off and the air tube almost sure to be damaged. Of course, there is nothing to do but repair or replace as promptly as possible. Instances have occurred where this irregularity has been felt, caused by a piece of wood with a nail in it, sticking to the tire. A tire shoe blowing out at one point becomes wider and apparently softer and produces much the same feeling when running fast.

NOISES—Under this heading may also come a variety of sounds arising from various causes. Premature ignition, loose bearings, loose distance rods, a small obstacle in sprocket or gears, or a broken, or a loose framework, permitting the engine to jump at intervals. Here, again, inspection is necessary and finding the trouble half the battle. When found, the obstacle can be removed, or the part adjusted. If caused by premature ignition, examine the lubrication, sparking, water circulation and fuel supply. Premature firing will sometimes occur, because of an over-rich mixture, and frequently occurs on hard pulls, like climbing a hill.

BROKEN CHAIN—Extra chain links are easily carried and should be kept in the vehicle. When a block chain is used, it is possible to repair a broken block by wrapping with wire and leaving the chain loose enough to pass over the sprocket. Sometimes a broken side link can also be repaired temporarily with a wrapping of wire, which will enable the user to reach his destination. In the absence of chain rivets a wire nail makes a fair substitute. In a roller chain, a wrapping of wire can replace a roller, but this is seldom necessary.

BROKEN SPRINGS—A broken carriage spring is not uncommon and while the average blacksmith cannot be depended upon for the best of tempering, he can usually weld a broken leaf so as to permit the journey to be continued. To get to the blacksmith shop it will usually be found possible to block up with stove wood, fence boards or anything else available, which permits slow, but safe, driving. Care should be taken after a spring is broken to avoid hard bumps, lest the axle be also damaged.

EDITOR'S NOTE—This is the twelfth of a series of articles by Charles E. Duryea. These articles will be prepared for publication in book form and will be distributed by the American Motor League to its members during the coming year.

Current Automobile Patents

LETTERS PATENT No. 800,647, dated October 3; to William A. Hatcher, of Cleveland, O.—The carbureter known as the Brew-Hatcher has a ball-valve controlled float chamber at one side with the mixture entering it from the bottom. To the side of this chamber is the mixing chamber with the air inlet passage in the bottom and the fuel pipe from the float chamber extending vertically through the center of the air chamber. Above the air chamber is a mixing chamber, the bottom of the mixing chamber being flap valves which separate it from the air chamber and the top of it formed by the throttle. The feature of the carbureter consists in the flap valves that separate the air and mixing chambers. The construction of these valves resembles the cutting of a pie into four pieces and hinging each piece at the outside, so that the center can be raised easily. In the center, however, is a small circular opening, in which is the needle valve for admitting gasoline with but a small air space surrounding it. As the motor speeds sufficient air cannot enter this opening and the flap valves are raised a little by motor suction and more air admitted. Each flap valve can be weighted to suit the requirements of the motor to which the carbureter is attached.

Letters patent No. 800,915, dated October 3; to Edward R. Hewitt, of New York—The invention relates to the carrying of a sub frame on the main frame of an automobile. The main frame is suspended on the four springs in the usual manner and the sub frame, on which is carried the motor and transmission, is carried on the side pieces of the main frame at four points, two points on each side piece of the main frame. Two of the points of support are coincident with the center of motion of the sub frame on the main one and the other two points are either to the back or front of these points. The two former points of support are pivotal.

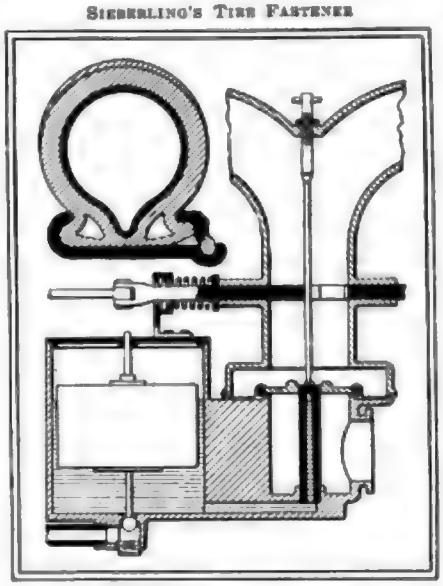
Letters patent No. 801,000, dated October 3; to William Y. Gambee, of New York—The device is a new form of connecting the steering knuckles of an automobile as well as innovations in the construction of the steering gear. Each knuckle carries a horizontal two-arm lever rigid with it, one arm extending to the front and the other to the rear. Midway between the knuckles on the car axle is pivoted a four-arm lever with arms at right angles to one another. To the forward and rear arms of the four-arm lever are fastened or pivoted the rods connecting the forward and rear ends of the steering knuckle arms and to the ends of the other arms those extending to the right and left, are pivoted rods running from arms on the base of the steering column. The latter arms are furnished with small gears which work on a semi-circular gear for lending support and holding the wheels of the car rigid.

Letters patent No. 800,684, dated October 3; to William E. Schneider, of Washington, D. C.—The inventor has a rotatory gasoline motor. The motor consists of two parts—a stationary casing and a rotating piston within it. In the latter are three tangential thimble-shaped recesses into which explosive mixtures is admitted through a valve system shown at the top of the illustration. At the lower left is shown the sparking apparatus, with recesses in the casing at that point so that when the explosion occurs the force will rest against the recesses in the casing and force the piston on in its revolution. Further around in the casing are six exhaust ports.

Letters patent No. 800,835, dated October 3; to Frank A. Seiberling, of Akron, O.—The invention relates to the method of securing pneumatic tires to the wheels. The wheel rim at one side has a clincher flange and at the other a seating for an endless ring. The tire, on the side of the endless ring, is retained on the wheel by a right angle flange held in place by the endless ring. In removing the tire the ring is first taken off, a turnbuckle loosening it, then the flange comes off and the tire can be removed.

Letters patent No. 800,864, dated October 3; to John C. Moore, of New York—The invention relates to an armor tread for pneumatic tires. The tire casing is made with a flat tread, encircling which is a flat metal band. The band is attached to the tire by studs with a large oval top passing through the armor and rubber casing and having on the inner ends a rubber protection for preserving the air tube.

SIEBERLING'S TIRE FASTENER



BREW-HATCHER CARBURETER

Letters patent No. 800,273, dated September 23; to Orson W. Davis, of Adrian, Mich.—The invention is a friction method of driving an automobile. A vertical motor is placed in front with the crankshaft longitudinally of the chassis. Axially in line with the crankshaft and to the rear of it is a transmission shaft, the front end of which is adjacent to the rear end of the crankshaft. The transmission shaft can, at will, be connected with the crankshaft through a band clutch. On the transmission shaft is a slidable friction wheel, the periphery of which contacts at opposite side with friction disks on cross shafts on the frame. The friction wheel can be moved forward or backward on the transmission shaft, by means of which changes of speed are gained. The drive from the ends of the disk shafts to the rear wheels is through side chains. The friction disks are moved against the periphery of the friction wheel by bell crank levers secured to the friction disks.

Letters patent No. 800,504, dated September 26; to L. E. Gibson, of Kokomo, Ind.—The invention is a friction clutch of the cone type. The female part is within the flywheel and the male portion is engaged from a sleeve on the transmission shaft through a double set of pivoted levers, one end of the levers being respectively pivoted to the male part and the sleeve and the other ends being pivoted together.

Letters patent No. 800,112, dated September 19; to Joshua W. Jones, of Harrisburg, Pa. The inventor's tire has a regulation tire casing within which is an inner air tube. Surrounding the tire casing is a wire protection in spiral form with the spiral holding the tire and is in turn held to the wheel by cross bolts from the lower side of it. The wheel rim has no clincher grooves, but rather the part carrying the tire is a semi-circular groove.

Letters patent No. 800,128, dated September 16, to William Gardiner, of Chicago.—The battery electrode of the inventor is made of relatively pure lead and consists of a plate suspended vertically with the connection at the top. The metal in the plate is folded with folds about 1 inch long and in the metal are transverse holes.

Letters patent No. 795,698, dated July 25; to William B. Hayden of New York.—In his fly wheel for explosive motors the inventor has the hub and spokes in a single casting keyed or otherwise fastened to the crank shaft. The rim of the wheel is two abutting metal rings that are offset to receive the ends of the spoke. The two rings are held together by cross bolts. The object of the construction is that rims of different weight may easily be attached to the spokes.

Letters patent No. 801,174, dated October 3; to John Bevington, of Cordova, Neb.—The roller bearing invented by Bevington consists of two circles of rollers, one for each end of the bearings. The rollers are not parallel throughout their length but of larger diameter in the centers than at the ends. In each end is a central rod acting as an axis for the roller, the rod itself working in the bearing in of the hoops slide one over the other.

Letters patent No. 800,784, dated October 3; to Edward C. Bailey, of Cromwell, Conn.—The device is a cushion tire for road wheels of vehicles consisting of an inner hoop which is convexed on its inner surface and flat on its outer. The ends of the hoop overlap, being adapted to slide one over the other when the diameter of the hoop is increased or diminished. Surrounding this hoop is an outer one with the inner surface flat and the outer one convex. The two hoops are separated by a series of rubber blocks, the latter being retained in position by the convexity of the hoops and adapted to slide slightly on the hoops when they are compressed and the ends of the hoops slide one over hhe other.

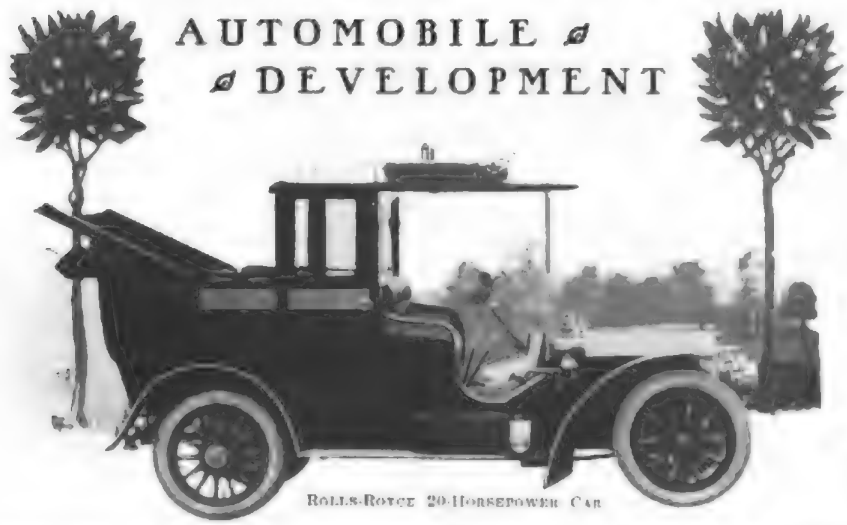
AUTOMOBILE DEVELOPMENT



ROLLS-ROYCE 20-HORSEPOWER CAR

ENGLAND'S FEATURE CAR

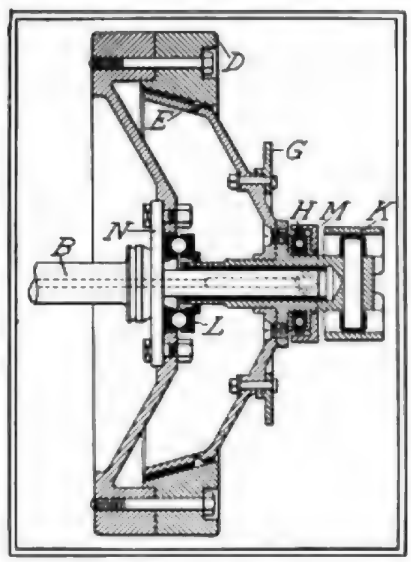
THE feature car of the recent Tourist trophy race on the Isle of Man, England, was the Rolls-Royce, the machine to take second honors, in spite of the features of construction and much talked of superiority of the machine. C. S. Rolls & Co., of London, its manufacturers, did not, however, build a machine specially for the event, but entered a strictly 1906 stock car. The 20-horsepower machine has as its leading mechanical requisites a vertical four-cylinder motor, with cylinders cast in pairs: friction cone clutch, sliding gear transmission, with four forward speeds, the third speed having direct drive and shaft drive to a rear axle of the floating type, the drive shafts of the axle not carrying any of the car weight, serving only to propel the wheels.

The frame is of pressed steel, tapering from amidships to the spring hangers. There are three cross ties in addition to the end braces, and the rear angles are also tied, not, however, to strengthen the frame so much as to provide a seating for the transverse leaf spring, upon which the rear end of frame rests, instead of, as usual, being hung from the ends of the axle springs. The wheel base is 109½ inches and the tread about 56 inches. The wheels are 35 by 5-inch drivers and 35 by 3½-inch steerers running on ordinary plain bearings of bronze or other desired metals.

The engine is of four cylinders, iron cast in pairs, 100-millimeter bore and 127-millemeter stroke, with a normal speed of 1,000 revolutions per minute, accelerating up to 1,500. The inlet valves, mechanically operated, are placed on top of the cylinders and so provide ports for inspecting the latter when necessary. The crankshaft is a nickel-steel forging running on five phosphor bronze bearings, with ring and splash lubrication. The crank chamber is of aluminum, halved and jointed horizontally, the lower half carrying the couple bearings for the shaft; a large inspection port is provided. The circulating pump runs off the crankshaft at right angles and the half-time gear is enclosed in the fore end of the crank case. Both pump and commutator are driven by skew gears, and the timing of the ignition is varied by sliding one of the skew gear wheels along its shaft instead of rocking the commutator on its axis. The commutator is divided into two parts, one forming a high tension distributor, and the other a low tension contact breaker. Only one trembler coil is necessary and the lining in each cylinder is synchronized.

The carbureter is of the usual float-feed type with a variation of the customary automatic air inlet. The middle valve is adjustable from the exterior and the whole device is extremely simple and efficient. The engine is governed on the throttle by the usual centrifugal device, and the crank revolutions can be varied by hand control from 150 to 1,500 revolutions per minute, or an equivalent of from 5 to 45 miles per hour on the top speed.

The lubricator shown on the dashboard is of aluminum, containing a pump belt driven off the engine. It maintains a normal pressure of 20 pounds per square inch, which is regulated in its feed by the conical screws attached to the sight feed tubes. The usual hand pump for extra lubrication of the engine is provided. The radiator is in the usual position in front of the bonnet and consists of the gilled vertical tubes running into end pockets, which have greatly supplanted the prettier but much less satisfactory honeycomb cooler. A belt driven fan behind the radiator helps to cool the engine. The tension of this belt is easily adjustable.



ROLLS-ROYCE CLUTCH

In the gear box practically the only variation from the design set out at the beginning of the present year is noticeable. This is the substitution of four for three forward speeds and the addition of a second sliding unit. The idea was to maintain the usual direct drive on the third, the usual top gear, and to provide a fourth or extra gear for the long downhill sweeps and fast running stretches. The gears were also altered for similar reasons. The standard figures are: First speed, 8 miles per hour, accelerated to 10; second, 16 miles, accelerated to 24; third, 32 miles, accelerated to 48. The car under notice was speeded—9½ miles per hour, accelerated to 14; 22 miles, accelerated to 33; 32½ miles, accelerated to 48, and 45, accelerated to 66 miles per hour. This will go to explain how the high average pace of nearly 34 miles per hour was maintained over the 208 miles in the Tourist race. The ordinary low speed gear is calculated to take a fully laden car up any incline of one in five, or 20 per cent. The usual foot brake is fixed at the rear end of the gear shaft, and acts through the differential gear, while the hand brakes are of the expanding double action type on the driving wheel hubs. The fixed pivots of the levers are at the bottom, and a floating fulcrum at the top ensures equality of brake pressure.

Full engine control is provided on the steering wheel in the center of which are fixed the necessary ignition and Corliss gas lever, working through the hollow steering post, so placed that the driver always has both in reach, no matter at what angle his steering may be set.

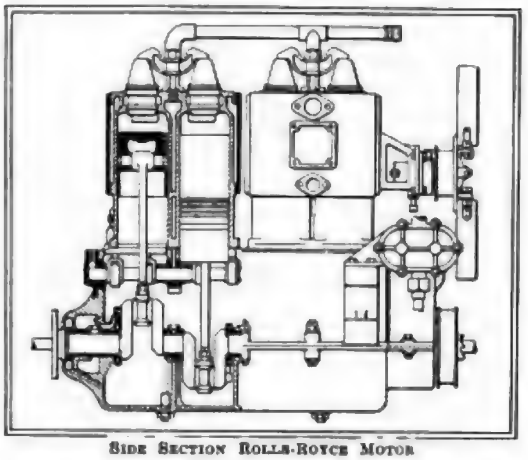
The front axle is a solid forging of nickel steel forked at each end, the steering pivots being fitted with ball bearings. The pivoted extension axle upon which the steering wheels run and are borne is bushed so that when worn the bearing can be renewed. The hubs are oil retaining and dirt excluding, end play being taken up by central flanges and washers, which also serve to ensure proper lubrication. The steering is through a case-hardened steel worm working in a phosphor bronze section with adjustable bushes to take up wear, and with ball thrust washers to take up weight of steering column.

The rear axle, which is of the live type, is designed so that the portion bearing the car load and taking up the traveling stresses is dead, while the transmitting mechanism is under no stresses other than those caused by transmitting the engine power to the road wheels. This is secured by constructing the rear axle of the two lengths of large diameter heavy gauze hardened steel tube, which run into and are flanged and bolted to the usual aluminum casting, which contains the differential and bevel gear. The wheels are then mounted on the steel tube ends by placing two hardened steel sleeves with suitable thrust washers, the wheel hubs being cor-

Digitized by Google

responding phosphor bronze bushes with large faces to take the end thrust. Inside the axle tubes suitable shafts communicate the power from the differential, each shaft having on its exterior end a jaw clutch which engages with suitable teeth formed in the outer end of the road wheel hub. The bevel gears have ball thrust blocks. Lubricant in bath form is used within the case.

In the clutch, the flywheel of the motor is slightly dished and is bolted to the flange N on the engine shaft B. Aluminum is the material used throughout. To the rim of the flywheel is bolted the ring D, forming the female part and operating within it is the male part E carried on a sleeve and secured thereto by flange and screws. A leather lining separates the male and female parts. The clutch sleeve connects with the drive shaft to the gear case through the universal joint K, secured by a vertical pin to the clutch sleeve. Engagement of the clutch is through the ring M, on either side of which are short arms for connection with the clutch pedal. End thrust is cared for by two sets of ball bearings—one set, L, between the flywheel and the bearing ring on the clutch sleeve, and the other set, H, for absorbing the engagement thrust and carried between the ring M and the flange on the clutch sleeve. A feature of the clutch is the brake disk G, so arranged that when the clutch is moved inwards for disengagement it comes in contact with a brake, which reduces the speed of its rotation and facilities the changing of the gears in the transmission gear case.



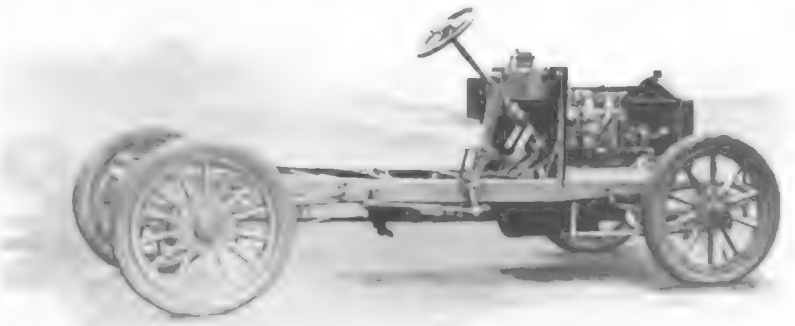
Side Section Rolls-Royce Motor

ENGLAND'S VETERAN CAR

The 18-horsepower Siddeley car, which was run through England's Tourist trophy race in the Isle of Man on September 14, was the veteran of the crowd and is an instance of the inclination, at present very apparent among European manufacturers, to return to the engine design of 2 or 3 years ago. This is not so much due to a belief in those earlier patterns as to the conviction that, as prices are falling, the simpler constructed engine and chassis must be reverted to. In addition, these simpler forms of engine have really given greater satisfaction to ordinary users, for the refinements of the past year or two have brought with them risks of failure, often out of proportion to their benefits, or they have not quite justified their cost. The car that does everything for itself is all right as long as it does it, but when it gives up it requires skilled knowledge to put it going again. This Siddeley car is over 3 years old. It was actually the first 18-horsepower car built by the Wolseley company of Birmingham for J. D. Siddeley, and, prior to the latter's 5,000-mile reliability match with Paul Meyan, had been driven upwards of 30,000 miles all over Europe. It is therefore a well-tried article and its behavior against the latest productions of other leading factories was followed with interest. The frame is of pressed steel of taper channel section. There are only three cross-members—one to carry the front part of the engine, one to carry the third support of the gear box, and one tail piece. The frame is stepped inwards 3 inches on either side of the dashboard to give a wide steering lock. The springs are semi-elliptical, 33 inches long in front and 40 inches behind. Both axles are of I-section forged solid. The front axle is of the jaw-ended type, the weight of the steering pivots being taken on ball bearings. The back axle is of the dropped type, and all wheles run on ball bearings, having four rows of balls in each hub. The four-throw crankshaft is carried on three main bearings and the bottom half of the crank case can be removed without disturbing the crank bearings. The water jackets to the cylinders are aluminum, cast in one piece with the crank chambers. The cylinders are of cast iron accurately ground to size. The cylinder heads are separate from the liners and set on with a ground joint. Both exhaust and inlet valves are mechanically operated, the valve pockets being at the same side of the cylinder, the inlet valve on top. The latter has a variable lift operated by a lever on the steering wheel and constituting the most economical form of throttle control. A bridge carries the rocking levers for this purpose and renders the valves very easy of access. By the removal of the two locking nuts the bridge can come away and the valve boxes lift right out.

Water circulation is by a gear-driven rotary pump through a gilled tube radiator. Automatic governing of engine on the usual throttle valve is adopted; the carbureter is of the ordinary float feed form and the clutch of the cone leather faced type. Three-point suspension for both motor and gear box is adopted, swivel bearings being provided for the frame joints of the differential axle case to avoid twisting stress on the latter. The internal portion of the clutch is mounted freely on an extension of the crankshaft and carries two arms for the propeller shaft between the engine and the gear box. The clutch spring is of the volute type, and is mounted on the crankshaft so that the end thrust is entirely self contained. The differential gear is of the straight-toothed type, which avoids the end thrust of the bevel-gear type. Four forward speed changes are provided, ample size being given to each pinion. The sliding gears are arranged on two sleeves and are operated by means of a drum and toothed section, which makes it impossible to present the gears irregularly. The main bevel gears are in a separate portion of the gear box to the sliding pinions, so that any steel chippings from the latter will not find their way into the bevels, which generally leads to noisy running and short life. The drive from the differential shaft to the road wheels is by side chains 11-16 inch wide and a 1½-inch pitch, running on 33-tooth sprockets on the interior faces of the driving wheels, the interior circumferences of the sprockets forming brake drums. There is no usual countershaft brake. Both foot and hand application are directed to the driving wheel drums. The right-foot pedal operates expanding cast iron shoes inside the brake drums, the shoes being expanded by adjustable toggles equalized for both wheels. The side brake, which runs in the same quadrant as the change speed lever, is pulled back to apply external band brakes on the same drums.

The steering gear is of the Panhard type, irreversible and adjustable for wear. Lubrication is gravity-fed throughout. Each cylinder and crosshead has a separate feed pipe and is independent of the splash, a diaphragm being placed at the top of the crank chamber to prevent oil splashing on the piston. The main bearings are specially fed and the crank pins provided with an oil catcher. The flywheel bearing has a ring catch to prevent oil leaking onto the clutch. The four vertical cylinders are 4 by 4-inch bore and stroke, showing 20 brake horsepower and 1,000 revolutions per minute and accelerating up to 1,800. The speeds provided for are 11, 19, 28 and 37 miles per hour; the wheel base is 7 feet 10 inches, with 4-foot 3-inch gauge. The wheels are 34 inches and the approximate weight of the chassis is 1,792 pounds. Bodies of all modern designs are fitted as per order, the only



Rolls-Royce 20-Horsepower Chassis

REGENT 18-HORSEPOWER TOURING CAR

restriction being additional price for enclosed types. The car that participated in the Tourist race was in every detail, as the rules required, a stock model, and the body with wide side entrances, heavy upholstery and fine finish conformed in every detail with the machines built for next year's trade.

THE CULVER RUNABOUT

The Culver is the name of a new runabout to be manufactured in Aurora, Ill., by the Practical Automobile Co., a recent $100,000 corporation. The machine will have a 6-horsepower, two-cylinder, air-cooled motor, with cylinders opposed and placed lengthwise beneath the center of the body. Circular flanges cool the cylinder walls and longitudinal flanges are used on the heads and valve cages. Mounted on a shaft, in line with the motor shaft, is a two-speed and reverse planetary transmission, with a sprocket between this and the flywheel for single chain drive to the center of the rear axle. A feature of the running gear is the use of larger road wheels than usual, and a still further innovation is found in the use of solid rubber tires. One of the incorporators of the concern is a physician who has had much experience with pneumatic tires puncturing, always when a hurried and urgent call had to be responded to, and the concern hopes by the use of larger wheels to partially make up for the loss of resiliency occasioned by dispensing with pneumatics.

PACKARD RATING

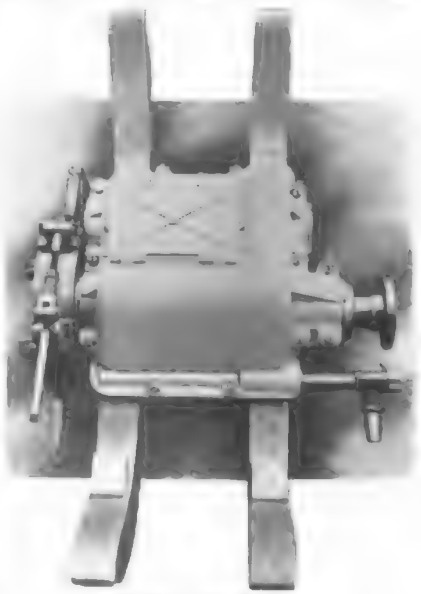
Motor Age, in a recent issue, in describing the Packard 1906 touring car, gave the rating of the same at 24 horsepower. The Packard Motor Car Co., of Detroit, Mich., manufacturer of the machine, gives facts relative to the rating of this machine. Model N, the Packard car of the present season, has four cylinders with a measurement of 4 1-16 by 5¼ inches, and is rated at 28 horsepower, and the 1906 machine has four cylinders with a bore and stroke of 4½ by 5½ inches, respectively, and is rated at 24 horsepower. The 1906 motor has frequently developed 46 and 47 horsepower on the Packard testing rack, but is nevertheless rated at 24, the reason for which is found in that it gives 24 horsepower at the motor speeds at which it will be operated 90 per cent of the time, considering that from 20 to 25 miles per hour is about the average speed at which the car will be driven, and at these rates the crankshaft speed is from 600 to 700 revolutions per minute. It has bene found on the testing rack that with the motor running at these speeds this amount of horsepower is generated. This method of motor rating is unique with many French makers, the builders of the Panhard machines rating at 24, machines that will show over 40 horsepower on the testing rack. The price of the 1906 Packard will be $4,000 and not $3,500, as appeared in the company's advertisement last week.

EDGE'S LATEST CAR

Prices of automobiles are dropping in Great Britain and some of the concerns that have previously enjoyed a lucrative trade in high priced cars have been affected so they are now bringing on the market smaller and lower priced machines. These concerns realize that the market for big cars is limited, in many cases, to replacing machines now in use, and that the big market is to be found with buyers looking for smaller machines. Perhaps the most interesting entrant into the small car field is S. F. Edge, Ltd., of Acton, London, which has ready a light car, the Regent, a machine of second grade when compared with the biggest cars now made. The Regent is an 18-horsepower machine, with four vertical cylinders carried beneath the bonnet. The cylinders have a bore and stroke of 3½ by 4¾ inches respectively and the rated power is produced with a crank shaft speed of 1,000 revolutions per minute. The mechanical valves are set in the bottom of integral ports on opposite sides of the motor, with two cam shafts required. Low tension ignition is adopted. The crank shaft is a drop forging and runs on plain bearings, all other bearings in the machine being of the ball type. Gasoline is fed to the float-feed carburetor from exhaust pressure and lubrication of the motor is by a positive pump gear driven off the end of the cam shaft. Motor cooling is through a gilled-tube radiator with water circulated by a pump gear driven off the crank shaft. In case of destruction of the pump the circulating system is so constructed that thermo-syphoning will continue to circulate the water. The clutch is of the internal cone type, leather lined, and is self-contained.

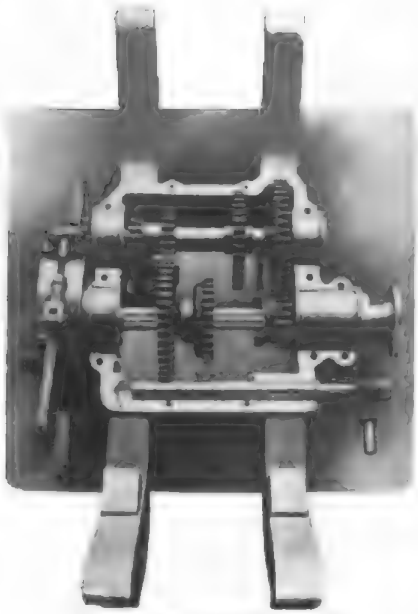
Three forward speeds and a reverse are gained in the gear box. Drive on the high speed is direct, with the counter shaft revolving. The sliding unit, two gears, is on the main shaft, and on the forward sliding gear are dental face teeth for connecting with the master gear on the clutch shaft for direct drive. The gear case is split horizontally in line with the main and counter shaft bearings, the top half being held in place by a dozen bolts, with nuts cotter pinned in place. The oil bath for the gears is provided by supplying lubricant through the inspection opening in the top at regular intervals. On the bottom of the case are four integral arms, one at each corner, for securing the case to the main or subframe of the car. The transmission from the gear box is by propeller shaft to the center of the live rear axle. Two sets of brakes are used—a single friction band one for regular use on the end of the gear shaft in the rear of the transmission box, which is pedal applied, and two emergency internal expanding ones on the rear hubs operated by lever at the right side of the car.

The car body is of rakish lines, partly occasioned by the use of a 114-inch wheel base, with the rear axle practically beneath the back of the body and the front axle, fashioned slightly along Mercedes lines, placed well to the front of the radiator. The rear semi-elliptic springs are swung outside of the sides of the pressed steel frame and the front axle has the usual motor clearance drop. The double side entrances are wide and hinged at the rear. The back of the rear seat is on a level with that of the front one and a short running board, terminating several inches in rear of the front fenders but connecting with the rear ones, are features of the body construction. Spark and throttle levers are on stationary quadrants on the top of the steering wheel. The change



REGENT GEAR BOX

Digitized by Google



REGENT TRANSMISSION GEAR

speed and emergency brake levers work in quadrants side by side at the right of the footboard. In the footboard are the clutch and regular brake pedals. The wheels are 32 inches in diameter and shod with 3½-inch tires. The tread is standard and the weight 2,198 pounds.

THE NEW COLUMBIAS

A new 20-horsepower four-cylinder car will be among the Columbia machines. In addition to this the 1906 line cars will consist of a two-cylinder car and a 40-horsepower, four-cylinder car, perpetuating the present models. All will show improvements as the result of another year's experience. The crankshafts, square shafts and all important parts of each model will be of nickel steel. The company's electric line will consist of the new lightweight brougham, which has already been described, and landaulets, hansoms and victorias, mounted on the same chassis as the brougham. The lighter Columbias, including runabouts and victoria-phaetons, will be continued. The company will continue to manufacture electric delivery wagons and trucks of load capacity ranging from 1,000 pounds to 10,000 pounds.

PHILLIPS' DUPLEX MOTOR

Double spark plugs in each cylinder and two throttle valves—one between the carbureter and one cylinder, and the other relatively placed with reference to the other cylinder and the carbureter, are the leading features of a new design of double opposed, water-cooled, automobile motor, made by W. L. Phillips, 405 Tacoma building, Chicago, Ill. The motor is made to hang beneath the bonnet of a car, the cylinders hanging crosswise of the chassis frame. The rated power of 12 is generated with a crankshaft speed of 1,125 revolutions per minute, at which rate the pistons travel 750 feet per minute. The bore and stroke are 4½ by 4 inches, respectively. The crank case is split horizontally in line with the crank shaft bearings, the two halves held together by opposing flanges and bolts. In the top half is an upper part for containing the cam shaft, cams and ends of push rods, and the top of this part is a square inspection cap, which, when removed, allows the mechanism within the crank case to be examined. Each cylinder is an integral casting with the valve ports on the upper side of the cylinder heads and with the mixture entering the front ends of the ports and the exhaust leaving from the rear ends. The cylinders have lugs for bolting to the vehicle frame. Both cylinders are water jacketed, a space of ¾ inch being left for circulation of the water. The inner ends of the cylinders and the flanges thereon are machined so as to fit tightly with the openings in the crank case, and are retained by screws through the flanges into like flanges on the crank case.

The crankshaft, a drop forging, has a diameter of 1¾ inches and has the cranks mounted at 180 degrees. It revolves on two bearings; the forward one 2½ inches long and the one adjacent to the flywheel being 3 inches. Each crank pin is 2¼ inches in length and of the same diameter as the crank shaft. The wrist pin bearing are 1 inch in diameter and 2¼ inches long. The pistons follow standard lines in construction, as do the compression rings they carry, a statement equally applicable to the the connecting rods that are made of phosphor bronze and 8 inches in length. The crank bearings are filled with nickel babbitt and bronze bushings are used in the piston ends.

All valves are mechanically operated and interchangeable. They are placed horizontally above the cylinder with the valve stems parallel to the cylinder bore. Each stem is surrounded by an extra heavy coil spring, extending practically the entire length of the stem and held thereto by key and washer. The cams are pinned in place. On the front end of the cam shaft is the large spur gear through which the drive is from the crank shaft. On this gear are the governor weights which are connected up with the two throttles, and on the end of the shaft outside of these weights is the commutator, pressed in place. The governor weights of the ball variety are secured to a sleeve of the shaft and the sleeve operates through a horizontal arm, which can be seen extending out of the casing and uniting with a similar vertical rod connecting with a cross arm over the top of the mixing chamber of the carbureter. One end of the cross arm is pivoted to the throttle controlling the right cylinder and the other to that for the left cylinder. The throttle can be set in any desired position to the cross arm, but once set the movement of each is the same relative to the movement of the cross arm by the governor. The mixture from the carbureter travels through 1-inch tubing to the valves, the distance to the right one being much less than that to the left. The maker claims to overcome any difference in the quantity of mixture reaching each cylinder by the adjustment of the different throttles to the cross arm. Double spark plugs are placed vertically in the tops of the combustion chambers. The exhaust pipes have a 1¼-inch diameter.

For marketing purposes the maker is showing the motor connected through a cone clutch with a three-speed and reverse sliding gear transmission, the whole outfit, the motor and transmission being adapted for final shaft drive. The cone clutch is located within the 17-inch flywheel which weighs 102 pounds. The sliding gear transmission is made with four integral lugs for attachment to the ordinary frame constructions. The main and counter shafts are side by side and with the case split horizontally in line with the bearings. On direct drive the forward gear of the pair of sliding gears on the main shaft is locked with the master gear on the rear end of the clutch shaft and on the other two forward speeds the drive is

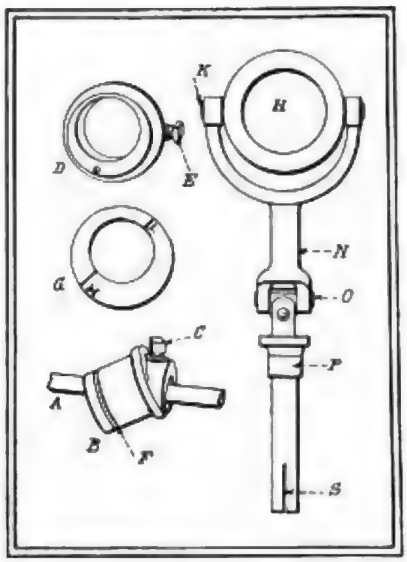
MASON-KIPP OILER ASSEMBLED



MASON-KIPP OILER DISSEMBLED

to the countershaft and then back to the main one. The reverse idler is on a shaft in the bottom of the case. All gears are face-hardened and are spaced by sleeves to obviate their getting out of position. Phosphor bronze bearings are used on both shafts and the base of the case carries an oil bath. Changes in speed are gained through one lever and the relations of speed to the direct drive are as follows: Low speed, 2-7; second speed 4-7 and reverse 2-7.

NEW MILWAUKEE MOTOR

Another two-cylinder opposed, horizontal motor for automobile uses comes from the Davis Mfg. Co., a Milwaukee hardware specialty concern that has experimented largely on gasoline engine construction. The cylinders with 4½-inch bore and 4-inch stroke are cast with the walls, water jackets, cylinder heads and valve ports made integral. The ports are on the top side of the cylinder heads, the valves being horizontal. The crank case is a spherical casting with the top removed. It is in halves, being split vertically in line with the crank shaft bearings, so that each half carries half of the bearings. The top of the case is a large square inspection cap and when removed the camshaft may be taken out without disturbing the crankshaft or connecting rods. This is accompanied by having the camshaft bearings contained between the walls of the case and the edges of the inspection cap. The crankshaft revolves in a pair of long bronze bearings. The pistons carry three rings and are ground, as are the cylinders. Steel is the material used in the connecting rods, which carry babbitted bronze bearings. The valves are mechanically operated, have a diameter of 1¾ inches and are interchangeable. The push rods carry steel rollers on the ends and work in sleeves 4½ inches long. On the end of the camshaft is carried a simple form of timer, enclosed within a cam-shaped case.

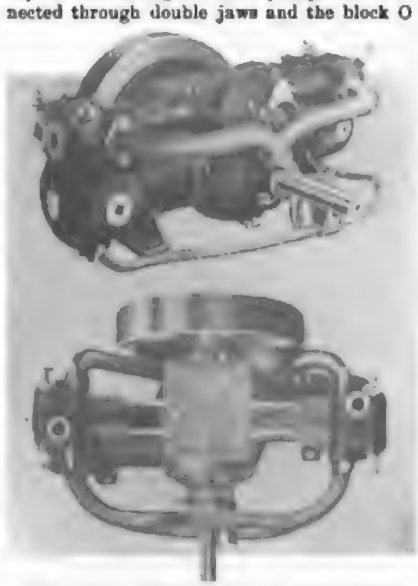
The carbureter is carried close to the crankcase and the pipes leading to the inlet valve branch above a short vertical part. They are flanged on the ends next to the valves and a couple of bolts hold them in place. The exhaust pipings unite near the lower part of the flywheel. Spark plugs are carried in the top of the valve ports, being placed in an angular position in the outer corners of the port. In the ends of the ports are inspection caps, screwed in place and which can be readily removed when the valves can be drawn out. On the side of the crankcase is a gear driven water pump. The lubrication calls into service a four-plunger oil pump which delivers a positive amount of oil, each bearing having its own pump with separate adjustment.

THE MASON-KIPP OILER

An automatic lubricator for automobiles which will force oil against a pressure of 1,400 pounds and which has no valve in its construction is manufactured by the Mason-Kipp Mfg. Co., of Madison, Wis., and is known as the Mason-Kipp. The oiler is of the single plunger variety, with the plunger moved through the medium of two eccentrics. Its working can be seen by referring to the assembled view in the illustrations. The plunger P is raised and lowered within the casing by the complex eccentric mechanism at the top. In the casing are two openings, one Q, through which oil is drawn from the reservoir, and the other R, diametrically opposite, through which the lubricant is forced to the parts to be oiled. In the side of the plunger P, near its base, is a vertical groove S. On the up stroke of the plunger the groove S is facing the opening Q, so that as a vacuum is created in the space made by the ascent of the plunger the oil is drawn through the opening Q and the groove S, filling the space T. When the plunger is at the top of its stroke an angular eccentric turns the plunger half around, so that the groove on the down stroke faces the exit R, and as it descends the oil is forced out of the space T, up through the groove S and out through the opening R to the parts to be oiled. With every up and down stroke of the plunger this operation is repeated and oil is delivered positively to the bearings.

The unique construction of the oiler is to be found in the eccentric combination at the top of the plunger. The plunger is connected through double jaws and the block O with the forked piece N, which carries the ring H through the trunnions K. There are two eccentrics, one to raise and lower the plunger and a second to rotate the plunger, so that on the up stroke the plunger groove faces the inlet passage and on the down stroke faces the exit port. The shaft A drives the pump and is itself gear driven from the motor or can be one of the motor shafts. On this is placed the barrel-like angular eccentric B, by means of which the rotation of the plunger is accomplished. The eccentric B is held to the shaft A by set screw C. Over B is placed the eccentric D, which has the set screw E for rigidly securing it in place, the inner end of E resting in the circular groove F in the left end of the eccentric B. Over the front part of D is placed the eccentric ring G for adjusting the position of the eccentrics B and D with reference to each other, so that the amount of lift given to the plunger can be varied. The complete eccentric device is then placed within the circle H, and is ready for operation.

The eccentric B is rigid with the shaft A and the eccentric D is in turn rigid with B, except for adjustments. As the shaft A revolves the raising and rotation of the plunger occur. To adjust the length of the plunger stroke the ring G comes into use. On it are the marked halves L and M, so that the amount of adjustment can be known. In adjusting the eccentric D is turned on the eccentric B. For the greatest lift the thick parts of both eccentrics are on the same side of the shaft A; the plunger then has a ⅝-inch throw, and when the full parts of the eccentrics are on opposite sides of the shaft the plunger has no throw.



THE DAVIS MOTOR, MADE IN MILWAUKEE

F. H. R. SPARK PLUG

The F. H. R. spark plug, taking its name from the initials of the manufacturer, Francis H. Richards, 15 Murray street, New York city, is an innovation in that the stem of it is made from a single piece of steel, with a thread on the upper end for attaching the wire terminals to. The stem carries on its lower end a circular head made integral with it. Double mica insulation can be looked upon as one of

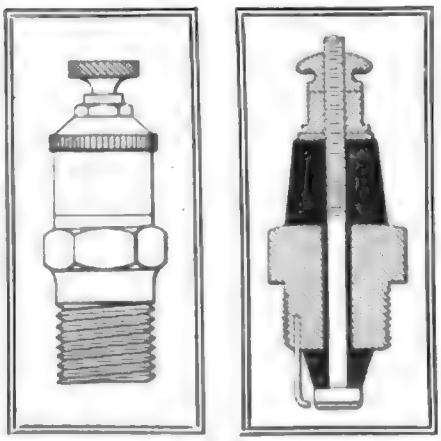
Digitized by Google

its features. Both above and below the metal part that screws into the cylinder head is a cylindrical mica sleeve, the upper one extending from the top of the metal part to the base of the cap beneath the top screw nut and the lower one separating the body metal from the end of the steel stem. The steel bolt throughout its length, within the metal body, is surrounded by an insulating sleeve. The second electrode is a curved wire within the metal body. It is well imbedded in it. All plugs are tested under high voltage before leaving the factory.

PORTABLE GARAGES

The latest addition to the line of portable automobile houses is one manufactured by the Lloyd Iron Roofing & Paint Co., of Chicago, which is fireproof in that the sides and roof are made from galvanized corrugated steel. These houses are made in sizes from 9 by 10 feet to 12 by 18 feet, with side walls 8 feet high. The advantage of the galvanized steel product is the safety with which the houses can be used in any part of the city, the danger of fire being absolutely eliminated as far as the building itself is concerned. The frame is made from iron and steel, iron piping of large diameter forming the uprights of the frame and the three horizontal pieces are made from angle iron with the angle facing inwards and downwards. Holding the uprights and horizontals together calls into use malleable castings, used wherever these two parts of the frame meet. Supporting the roof are T-iron rafters rigidly secured at the eaves to the top horizontal parts of the frame and similarly fastened at the apex, and midway of the eave and apex are angle iron purlines for assisting in carrying the rafters and also for holding the 24-gauge galvanized 3V-crimp steel which forms the roof. The ridge roll along the apex and the finals at each end of it are made from galvanized metal and attached so that the roof is waterproof. The sides, ends and doors are made from sections of galvanized corrugated steel. Light is supplied through a small window in the gable, and in either side a 2 by 3-foot window. One end is given to double swing doors, which give an opening 8 feet square. The door frame work consists of three horizontal angle pieces braced between the ends by angularly placed pieces, to which the metal is attached. On the doors are iron hasp for padlocks. The foundation is not supplied but can be made from cement, concrete, asphalt, cinders or other inflammable material. The company is also marketing another make of portable house in which the same style of frame work is used but the sides and doors are made from matched and beaded pine. The roof is of steel. This style of house is adaptable for sections outside of the fire area of cities. The size of the wood building is identical with that of the steel, as are the doors, windows and roof.

Buyers residing in cities remote from the seat of manufacture, require little mechanical skill in putting the houses together. The manufacturer delivers the building in parts, framework, roof, walls, doors and windows being properly marked, so that buyers experience slight difficulty in following the instructions.



H. & M. 1906 SPARK PLUGS F. H. R.

In the putting of the parts together bolts are used almost exclusively, so that once together it is always together, and winds, rains and frosts can provoke but slight results. The foundation is furnished by the buyer, who must see to it, that whatever kind of purposes using is ready for receiving the building, then with the aid of an average carpenter and an assistant laborer the work can be completed within a day, and the owner finds himself independent of the garages and the annoyance of walking to public stations.

THE H. & M. SPARK PLUG

E. J. Willis & Co., Park place, New York city, are out with a new design of spark plug, to be known as the H. & M. Conspicuous in its construction is the use of a hollow central rod forming one electrode. This rod throughout its length is insulated from the metal body part of the plug. The rod is enlarged at the inner end into a bell-shaped portion in which is held a metal ball. The ball is retained in this expanded part by a circular ring pressed into a circular groove in the inside of the metal plug, one end of the ring being bent radially across beneath the metal ball, retaining it in position and forming the other electrode. When the motor is not vibrating the ball rests on the cross part of the ring and is not in contact with the bell-shaped end of the central electrode. At times the spark passes between the bell part and the top of the ball, and at periods of vibration, when the ball does not rest on the cross part of the ring, it passes between the bottom of the ball and cross part of the ring. The company claims that at all times there is sufficient space between the ball and either the bell-shaped part or the cross part of the ring to give a good spark. The vibration of the ball keeps all dirt off the electrodes, thereby preventing sooting up. The hollow central electrode admits air during the suction stroke of the motor, the air aiding in cooling the cylinder head as well as helping in keeping the plug electrodes clean.

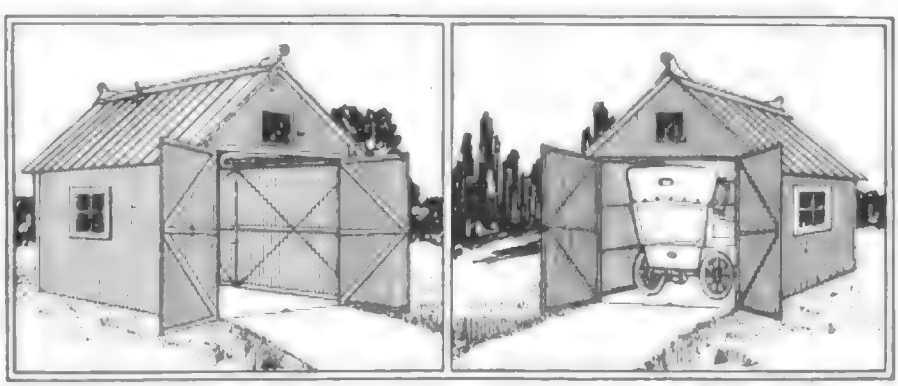
MOTOR CAR LITERATURE

The Reeves Pulley Co., of Columbus, Ind., illustrates its four-cylinder air-cooled automobile motor in a ten-page booklet, in which is a description of the motor, as well as line drawings of several of the leading constructions used.

The Auto Girl and the Seasons is the name of a natty little book now circulated by W. B. Riley & Co., Philadelphia, in the interest of the Riley laprobes for use in automobiles. The romance of the automobile robe in wet, dry, windy and dusty weather is given in verse, and each page is suitably illustrated. The book is accompanied by another, having on alternate pages illustrations showing the exact size of texture used in the robes and the colors in each.

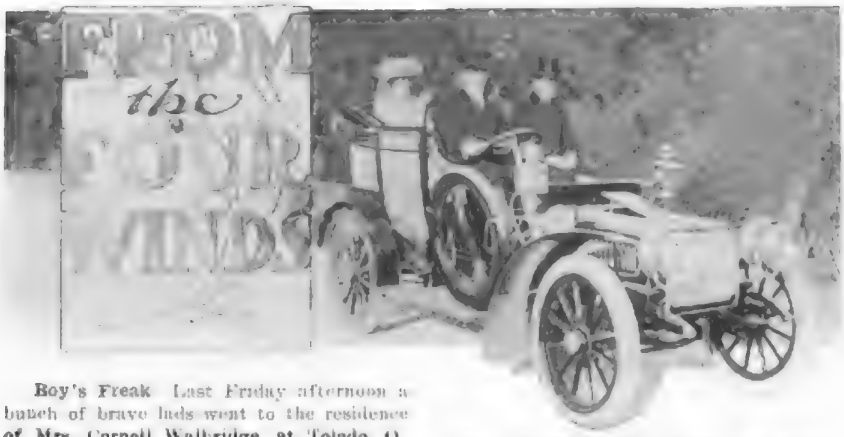
Type X, the new 20-horsepower Pope-Toledo car for next year is shown in a neat twenty-page catalogue. The front and back covers comprise one scene, of woodland nature, showing the car approaching along a wooded road on the front, and departing along a similar one on the rear page. Each page of the book is filled with a landscape scene containing the car and a small square of reading matter thrown in the corner. In addition to details and illustrations of the machine a list of Pope agencies is given. The printing is in green and the car illustrations in black.

Plain Gas Engine Sense is a new book on the gasoline engine, by E. L. Osborne, and published by the Gas Power Publishing Co., of St. Joseph, Mich. The book contains 123 pages, divided into twenty-two chapters, dealing with such parts of the engine as: different cycles, fuels used, compression, ignition, wiring, power and heat losses, cooling, governing, timing of valves, regrinding valves, lubrication, brake tests, packings, different designs and troubles. Upwards of a dozen line drawings are used in explaining the wiring and other parts of the motor and as many half tones illustrating other motor parts. The book is published in pocket size, and bound with double covers in tan-colored cloth.



WOOD AUTOMOBILE GARAGE STEEL AUTOMOBILE GARAGE

Digitized by Google



MRS. LESLIE CARTER IN HER DEAUVILLE

Boy's Freak—Last Friday afternoon a bunch of brave lads went to the residence of Mrs. Cornell Walbridge, at Toledo, O., stole quietly away with her automobile and drove it to Erie, Mich., where they abandoned it.

Another Beach Meet—The Atlantic City Automobile Club has scheduled another beach meet over the Ventnor course for October 27. The entries of quite a number of the contestants in the Vanderbilt cup race have been promised the promoters, who are endeavoring to wrest the short-distance honors from the Cape May course.

Will Entertain Visitors—The New York Motor Club will give a house warming at its new club rooms at the Cumberland, on upper Broadway, this week. On Friday it has undertaken to give 100 members of the Chicago Press Club, who are to visit the New York Press Club, a ride through Central park and Riverside drive and down town to the city hall, where a call will be made on Mayor McClellan.

Bisons Ask Why—At its session last week the board of governors of the Automobile Club of Buffalo appointed a committee, consisting of Secretary Lewis, H. A. Meldrum and W. H. Baker, to ask the officials of the American Automobile Association why the Thomas racing car entered by Harry Houpt in the Vanderbilt cup race was not chosen as one car of the American team. The basis for the club's action is that the car was entered as representing the Automobile Club of Buffalo.

Enthusiasm at Milwaukee—Plans for an enlargement of the sphere of usefulness of the Milwaukee Automobile Club are well under way. Sherburn M. Becker, one of Milwaukee's wealthiest young men, a member of the city council and one of the most enthusiastic motorists in the city, has been chosen president. The other officers of the club are: First vice president, Dr. Louis Fuldner; second vice president, F. G. Curtis; secretary, James T. Drought; treasurer, William H. Pipkorn. S. M Becker, James T. Drought and Dr. Louis Fuldner were chosen as directors for 3 years; W. H. Pipkorn, F. G. Curtis and H. H. Rice for 2 years, and Dr. Lewis Sherman, J. R. Barthelet and C. I. Drake for 1 year. For the winter season a series of meetings is planned, at which papers or lectures on the automobile, its care and management, and similar topics will be given by recognized experts in their various lines. The club starts on its new career with a total membership, after eliminating all dead timber, of 125, all active automobilists and owners of their own machines.

Takes Corner Too Soon—The first arrest in Buffalo of a motorist for turning a corner too sharply was reported last Friday, when A. Judson Wells, a well-known real estate man, was taken into custody by Patrolman Talty.

Fast Climb in Packard—Wayne Davis, of the Philadelphia Packard agency, broke the record up Wilkesbarre mountain last Sunday with three passengers in the 1906 Packard he was trying out. The previous best was 8 minutes 30 seconds. Davis drove his car from the foot of the mountain to the summit in 3 minutes 44 seconds.

Labor Union to Buy Car—The national convention of street railway employes, held in Chicago last week, appropriated $20,000 to buy ten automobiles to be used by the union to convey passengers wherever there is a street car strike, the profits from the fares to go back into the defense fund, where the $20,000 was taken from. The union already owns three automobiles, which were used during a strike at Saginaw, Mich.

Novel Use of Car—Members of the board of education of the state of New Jersey assigned to examine candidates for appointment to school superintendentships, worked an innovation last week by traveling from county seat to county seat in automobiles. The entire trip cost the state but $175, of which $125 was for hiring the machines. The same trip by railroad in former years consumed considerably more time and money.

Doctor's Queer Diagnosis—J. B. John, a well-known young business man of Oakland, Cal., is at death's door and Dr. M. M. Enos, who is attending him, attributes Mr. John's condition entirely to the excessive use of his automobile, which, he claims, has by the jar disturbed the nerves and the circulation of the blood. In speaking of the case Dr. Enos said: "I attribute Mr. John's condition to the reckless and excessive use of his automobile. He was constantly riding about in his machine and he did not pay proper attention to crossing tracks and looking out for holes in the street. His machine was a short runabout and there is more jar to the short than to the long machines. The result was that he constantly subjected his system to jar and jolt until this condition has arisen."

Quakers' Football Pad—The denizens of Philadelphia's automobile row are trying to eke out the weary between-season hours by indulging in football. A likely team of candidates is having three practices a week, and is trying to induce a similar team of New Yorkers to meet it on the gridiron.

Something Free—The New York and New Jersey Telephone Co., at the instance of A. R. Pardington, its contract manager, who was formerly chairman of the A. A. A. racing board, is distributing free among motorists its fine road map of Long Island, by making application to A. R. Pardington, 81 Willoughby street, Brooklyn.

Fighting Boodlers—The City Party campaigners, who are endeavoring to oust the boodlers from the Philadelphia city hall, are using the big Seeing Philadelphia rubber wagons every night to attain that end. Shortly after dark these big cars, each with a liberal supply of red fire and spellbinders, invade a ward where the machine is particularly strong, and broadsides of unanswerable arguments are hurled into the gang. The innovation is making a decided hit.

Glencoe Removes the Bumps—After winning its point in the court, which ruled that Glencoe would not have to remove its famous bumps which were put in to prevent automobile scorching, the village board has passed an ordinance extending the speed limit from 8 to 15 miles an hour. In notifying the Chicago Automobile Club of this action, Gordon A. Ramsey, president of the village board, claimed the honor for Glencoe of being the first city or town in Illinois to permit such a high speed by automobiles.

Women's Club Formed—A club exclusively for women is the latest thing in San Francisco motoring circles. At a meeting held this week a number of enthusiastic women drivers formed the Women's Automobile Club of California. Those present decided not to allow the men even to participate in the club runs. The following officers were elected: President, Mrs. Alfred J. Marsh; vice-president, Mrs. Fred Linz; secretary and treasurer, Mrs. J. Gabriel. Dues of $1 per month will be charged all charter members and after the charter is closed an initiation fee of $2.50 will be exacted, and the dues will be reduced to 50 cents.

Joke on J. D. R., Jr.—An amusing incident has just happened to J. D. Rockefeller, Jr., while touring in Switzerland. A party consisting of Mr. Rockefeller, his wife, two friends and a chauffeur, set out from Chamonex, intending to cross the Alps by the Tête Noire pass. They were unaware, however, that this pass is closed to automobiles and were only enlightened when a gendarme stopped them and refused to allow them to proceed further. As the gendarme refused to allow the car to be driven, eight horses were brought and harnessed to the machine, and in this strange manner the whole party arrived at Hotel Mont Blanc at Martigny. The

Digitized by Google

American entered heartily into the joke, paid the heavy fine with a smile and treated the gendarmes to a sumptuous dinner.

Boy Builds a Car—Sandusky, O., has a genius in the way of an original automobile builder. Harold, the 12-year-old son of Myron Caswell, of that city, last week surprised a number of citizens by completing a runabout. While it is an odd-looking affair, it shows the mechanical ability of the lad.

Buffalo In Map Business—President A. H. Knoll and Secretary D. H. Lewis, of the Automobile Club of Buffalo, are busily collecting information for the use of members of the club who desire to tour in western New York. Secretary Lewis intends to publish soon a road book which will give detailed information about a large number of runs near Buffalo and will include data about the Chicago-New York automobile route.

For Convict Labor On Roads—Wellington F. Loucks, organizer for the National Good Roads Association, is a good missionary. Already his efforts are productive of results. In Ohio he is succeeding in interesting many residents of that state in the bettering of the highways. At Lima three sessions were held at the Allen county court house. An organization was perfected with D. J. Cable as president, J. G. Roberts as vice president, M. Emmett as secretary and N. McBride as treasurer. A resolution was adopted which declares for convict labor to be utilized in making repairs and maintaining the roads throughout the state. A similar meeting was also held at Tiffin the latter part of last week.

Soaks Motorists—Complaint is made by motorists who use the Jeffersonville and Utica turnpike in Indiana that George Smith, owner of the road, is exacting too heavy a toll. He is said to be a motorphobist and to keep cars from using his highways charges 75 cents for driving 6 miles. He would rather they kept off the road, he says, than pay him his fee.

Suicide of Tour Survivor—W. B. Saunders, a well-known motorist and medical book publisher of Philadelphia, and the only representative of the Quaker City in last year's endurance run to St. Louis, committed suicide at Atlantic City last Saturday night. Mr. Saunders was suffering from a nervous disorder and was in charge of a physician and nurse at the time.

Make Light of Lights—The members of the police force of Washington, D. C., have been scored by the superintendent of police for their failure to enforce the regulations which require motorists to carry lights on the rear of their cars. The superintendent sets forth that numerous cars are without lights and there are others so dim that the numbers on the machine cannot be distinguished. The superintendent intimates that he will resort to radical measures if the motorists do not comply with the regulation.

Lights Blind Motorists—The governors of the Automobile Club of Buffalo have voted to ask the management of the Williamsville trolley line to put shades on the headlights of the Williamsville cars. It is claimed by the motorists that the lights are so strong that they blind motor car drivers and cause accidents.

Mrs. Carter Luxurious—Mrs. Leslie Carter, the actress, is showing New Yorkers just how much style can be put on in an automobile. She uses a new Decauville landaulet going to and from the theater, with a chauffeur in approved livery, as well as a tiger with silk hat and other appropriate togs to jump down and open the door for her.

Bisons Going To Race—Buffalo motoring enthusiasts have engaged a special Pullman to take them to the Vanderbilt cup race. The car will leave Buffalo on a regular Lehigh Valley train on Thursday night, October 12; will arrive in New York on Friday morning and remain there until evening, when it will be switched to Hempstead, L. I. After the race the car will be taken back to New York, where it will lie until Sunday evening. The party will arrive home Monday morning. The Cleveland Automobile Club will also be strongly represented at the race, while there has been a general exodus of westerners to the east to take in the big event.

INTERESTING STORIES PICKED UP IN MOTORDOM

"HERE'S a cat story for you," drawled the department store owner at the club. "This happened in town and doesn't take long to tell it. My man was driving me home the other night when Tabby ran out into the street. We scooped her up as prettily as I ever pulled a big fish out of the water with a landing net. But there was a grinding sound, mixed in with a few feline squeals and we came to a stop just as if we had put on the emergency brake. Tangled up in the chain was the finest lot of cat meat you ever saw and it was some time before we could clear our chain."

"My daughter gave a cow a fine ride the other night," said the banker. "It wasn't the usual kind of a ride where your car pushes a bovine along the public highway, but the animal actually occupied a seat. My girl was taking a spin with her chum and the usual male accompaniment. Going into a town they sighted five cows driven by a man and a boy. 'Honk, honk,' went the horn, but the girl was taking no chances, so she came to a dead stop while the road was cleared. Just as she started up one of the cows became curious and calmly walked in front of the machine. The bump followed and Mrs. Cow turned a complete somersault in the air, coming down in the empty seat. She was carried some distance before a stop could be made, then she rolled out of the car at the side, none the worse ofr her lively experience," and the banker never smiled as he finished.

THEY'RE telling a story in Chicago of a man buying an automobile in place of of an umbrella just to escape going home through the rain. J. W. Kiser is alleged to be the hero of the tale. Mr. Kiser at one time used to be the head of the firm that made Monarch bicycles and since the automobile came in he has ben prominent in his devotion to it. He is credited with owning something like seventeen cars, but like a boy with a choice collection of marbles, he is not averse to adding to his stock.

"I saw the whole thing happen in a garage down Michigan avenue," says the man telling the story. "It was raining and raining hard when Mr. Kiser scooted in to get out of the wet. He evidently was in a hurry to get home and paced up and down the store waiting for the rain to let up. While wearing out shoe leather in this manner he noticed a fine looking electric belonging to C. J. Metzger, who runs the place, a car that the dealer used for his own pleasure. 'That looks pretty good to me,' said Mr. Kiser. 'Is it for sale?' 'Everything I've got is for sale, if I get my price,' says Metzger. 'Well,' says the ex-bicycle magnate, 'I don't want to get wet going home and I've got to be getting along, so let me have that car.' So he outs with his check book, makes the paper good for a large bit of coin, steps nonchalantly in the rig, up jumps a chauffeur and Mr. Kiser is taken home, 15 blocks away, dry shod. I guess that's a record hard to beat."

IT takes something more than Jersey justice to feaze a Windy city motorist, as was evidenced last week, when the Hammonton sleuths apprehended Frederick H. Rawson, of Chicago, for traversing the sacred soil of the mosquito state without a Jersey license. When taken before Justice of the Peace Garton, Mr. Rawson explained that although he had written to the secretary of state for a license blank, and had received it, he had, through forgetfulness neglected to observe the other formalities and in consequence had started from Atlantic City without giving the matter a thought.

"I'm sorry," said Justice Garton; "but I'll have to fine you $50 and costs, Mr. Rawson."

"Very good," calmly replied the latter, stripping a hundred note from a plethoric roll he fished from his pocket, and handing it to the judge. Then from an inside pocket of his coat he produced some excellent cigars and treated all hands, finally inviting the whole crowd across the street to a moisture store, where he stayed long enough to knock a rather big hole in the change from the hundred-spot. Meanwhile the women in his car, which had been left standing at the curb outside the justice's office, had bought several pounds of candies and were treating all the children in the neighborhood. Altogether Rawson seemed to actually enjoy his first run-in with Jersey justice. The Hammontonians did, at any rate, and voted Rawson a good fellow.

FINISHING CYLINDERS

Toronto, Ont.—Editor MOTOR AGE—Will you explain the difference in the three terms applied to finishing the interiors of cylinders of gasoline engines; grinding, turning and reaming? Which of these three is the best, and what are the merits of one or the other? —N. Jones.

Turning a cylinder means to revolve the cylinder in a lathe and to take a cut with a tool having an axial movement. It is poor practice, as when bolted to the face plate it will probably be out of balance, and the spring of the tool and the cylinder will produce a tapered hole. In boring a cylinder a cutter is inserted in a rotating spindle, the cylinder remaining stationary. This produces a much better piece of work, although there is still the spring of the tool with which to contend. Another fault is the inability to produce cylinders of the same bore. Reaming a cylinder is performed by a spindle, having several cutters inserted in a head attached to it, revolving inside of the cylinder, which is stationary. By this means a very fine cylinder may be produced. Usually two reamers are used, the one for the last cut taking only a few thousandths of an inch out of the bore. The size across the reamer cutters is the size the cylinder is to be bored. The cutters working on both sides of a diameter do not tend to bore elliptical holes. Grinding is performed after the above operations. About 10/1000 inch is left to grind. The cylinder remains stationary and a little high-speed emery wheel is given a rotary motion. The wheel rotates at high speed upon its own axis, and its axis is given a rotary motion, the combined movements bring the wheel in contact with the inside of the cylinder leaving the finest finish possible.

MOTOR MEASUREMENTS

Reading, Pa.—Editor MOTOR AGE—Will you kindly inform me through your Readers' Clearing House the following: What will be the horsepower of a four-cylinder motor with 4½-inch bore by 4½-inch stroke at 1,000 revolutions; also 4½-inch bore and 5-inch stroke? What should be the diameter and weight of the flywheel on each? How should the inlet and exhaust valves close and open on both and what size should the valves be? How much compression in pounds should each have and how do you register compression with an ordinary steam gauge screwed in spark plug hole? If it would show 80 pounds on gauge turning the engine by hand, would it be counted as 80 pounds compression? How long should the connecting rod be on a four-cylinder engine with 5-inch stroke? What size inlet and exhaust pipe should be used?—SUBSCRIBER.

A four-cylinder motor 4½ by 4½-inch will develop 24 horsepower at 1,000 revolutions per minute. The 4½ by 5-inch motor at the same speed will produce 28 horsepower. In either case use a flywheel 18 inches in diameter with a rim weight of 75 pounds. The pressure as registered by a gauge placed in the spark plug hole will be less than the actual compression, due to the slow speed of rotation and to the space occupied by the piping to the gauge. If rotated rapidly the swing of the needle will make it register too much. An indicator should be used. A compression of 90 pounds is fair practice. To get this have the clearance 24 per cent of the total volume. The minimum length for a connecting rod when the cylinder center is not offset with relation to the crankshaft should be two and one-eighth times the stroke and is independent of the bore. For the inlet a pipe 1⅜-inch inside diameter is correct. The exhaust would better be 2 inches, although 1¾-inch will do. The valve diameters should be 1 9-16 inch and 1⅜ inch, respectively, for the inlet and exhaust. These apply to both sizes of motors. Have the exhaust valves open when the piston is distant 12½ per cent from the stroke end and close upon the upper dead center. Open the inlet at this time and continue until 8 per cent distant on the compression stroke.

WASHING AUTOMOBILES

Chicago—Editor MOTOR AGE—I can't keep the polish on the body work of my car. When purchased early this season, it had an eighteen-coat finish, which now is practically gone, leaving nothing but a dead finish. My carriages retain their gloss from season to season, while but a few months are necessary to destroy the finish of the best finished automobile. A friend, who is a local carriage builder, ventured the explanation that it is because the grease and oils from the motor and exhaust, which accumulate on the machine. To remove these soap is required. Most soaps contain more or less alkali. These soaps are invariably used in removing the grease. When applied, the alkali in the soap is attacked by or attacks—I am not sure which—the acid in the varnish, and the gloss is gone. Are there any soaps manufactured at the present time in which alkalis are not used or used so slightly that their attack on the lustre of the car would be considerably decreased? What is an easy method of analyzing soap to discover if it contains large quantities of alkali? In washing a highly finished automobile body, should the car be exposed to sunlight while the water is being applied? This is a point much discussed by owners of cars in this city, some contending that direct sunlight is necessary while washing, and others holding that the sunlight passing through drops of water on the body burns small spots in the finish and so partially ruins it.—W. T.

Soft soap and preparations for cleaning automobiles usually contain alkali, which attacks varnish. The mud itself has this effect, an account of the nature of the refuse forming the mud, which contains a high percentage of ammonia. Ammonia is an alkali and injurious to varnish. To test a soap for alkali form a suds of the soap. From a drug store get a strip of yellow litmus paper. If the suds are alkaline, this paper will turn red; if the color is retained, the soap is neutral or else acid. There is no great chance of its being acid, so the alkali test is sufficient. The body should be washed and dried with a chamois before exposed to the sunlight.

ANTI-FREEZING SOLUTION

MOTOR AGE recommends the following as the best anti-freezing solution, all things considered: Use 4½ pounds of pure calcium chloride to a gallon of warm water. Mix and filter before placing in radiator or tank. Replace evaporation with clean water and leakage with solution.

TOO MUCH AIR

Joliet, Ill.—Editor MOTOR AGE—I have just completed a month's trip in a boat, down the Illinois and Mississippi rivers, and not for an instant did I have trouble with my motor except very early in the morning or during the evening. It is a two-cycle motor, with make-and-break spark and a vaporizer instead of a carbureter. The motor would run at all times but was erratic and would seem to die down and then pick up. I had a magneto and took the pains to put in six dry cells, so am satisfied the spark was good. I am still in the dark as to the cause of the trouble, however.—J. W. B.

The probability is the air inlet was too large for night running. During the day the air, being warm, would mix with a smaller quantity of gasoline vapor than it would at night, when at this time of the year a cold vapor is given off the water. Either a larger feed of gasoline or a decrease in the air supply would have remedied the trouble.

BROKEN CONDENSER

Brooklyn, N. Y.—Editor MOTOR AGE—Kindly let me know how to tell when the condenser of a non-trembler coil is broken down? My coil seems to miss and I cannot lay it to anything else. I have large spark at the contact, which I cannot account for any other way. Does not this signify a broken condenser or coil? I have a de Dion engine. Can this timer be changed for a trembler coil purchased at reasonable expense?—W. R. WICKE.

The trouble is probably in the condenser if a large primary spark occurs. Do not attempt to repair the coil yourself, as it will be much cheaper and decidedly more satisfactory to have a coil maker repair the condenser and add the vibrator. Repairs attempted by the owner of a machine, if he is mechanically inclined, and not an electrical expert, often result in worse conditions. Coils require careful workmanship and the condensers, in particular, call for exceptional care. Well repaired by a good workman means always repaired.

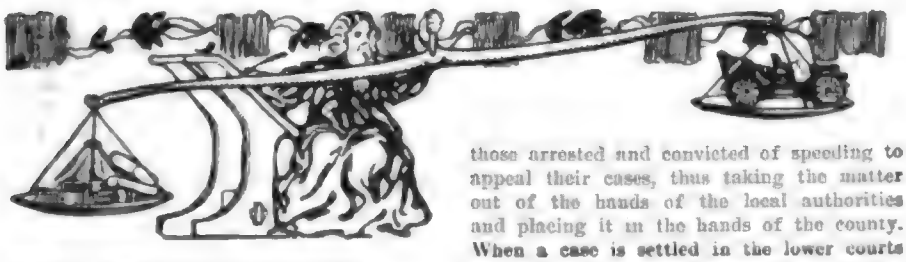
LEGAL LIGHTS AND SIDELIGHTS



NEW LAWS FOR CLEVELAND

Cleveland's chamber of commerce traffic regulation committee, which is framing an automobile ordinance for the city council, will probably present it at the next council meeting. It is announced that, among other things, it will provide for the division of the entire city into automobile controls in order that the speed regulations may be enforced more easily. One control will embrace the entire crowded district surrounding the public square and within this limit speed will be restricted to 4 miles an hour. In the balance of the business district, which will be clearly defined, there will be a limit of 8 miles an hour, while in the residence districts, a speed of 15 miles an hour will be permitted. By clearly defining these districts, there will be no possibility for offenders to escape on the contention that the term "business section" is misleading and not specific as has been done under the state law, which the officials tried to enforce. Another section of the ordinance will deal with the fixing of lights and it will require that every car be equipped with a lamp, which will illuminate the number at night. The numbers must be kept clean and the trick of smearing the number with oil so it will gather dust and become indistinguishable will not work in the future. The ordinance will also embody a clause preventing the owner of a car from allowing it to stand in the streets in one place for more than an hour. There will be a lot of other points which will tend to make the operation of cars in Cleveland more stringent than heretofore.

TO SPIKE COPS' GUNS

The rural constable, the man who lies in wait for his prey, concealing himself in the bushes along the roadside, is now to receive some consideration at the hands of the organized motorists of Massachusetts. The Bay State Automobile Association and the Massachusetts Automobile Club, through their legal representatives, have done heroic work in securing the repeal of certain drastic speed laws in something like eighteen of the towns and hamlets in this state during the past season, and now the legal committee of the Massachusetts State Automobile Association of the A. A. A., which, by the way, is composed of officers of the two above clubs and also of the Worcester Automobile Club, is to go a step further and wage a war of retaliation on the fly farmer cop. There is no question but what these officials have been reaping a harvest off the unwary and, in many cases, innocent motorists, and the latter have been forced to accept their fate in this line. A different tune will, however, be played in the near future, as efforts are to be made to induce those arrested and convicted of speeding to appeal their cases, thus taking the matter out of the hands of the local authorities and placing it in the hands of the county. When a case is settled in the lower courts one-half of the fine imposed goes to the town and the other half to the county, but where the case is appealed the entire amount of the fine goes to the county and the town loses, likewise the arresting officer who, in the latter case, gets only his witness fees, whereas in the former he generally gets a fair percentage of the amount paid the town. It can, therefore, be readily seen that if the idea of an appeal is generally carried out there will be little to be gained by the fly cops, and that with the fruits of their work going elsewhere they will soon cease their objectionable persecution, for persecution it is, of the motorists. Further than that, the receipts of the several towns will have a great falling off. Another thing which the state association is to attempt during the coming session of the legislature, is to secure the enactment of a law which will give the money secured from fines of automobilists for speeding to the state highway commission, to be used by it in the construction and maintenance of state highways.

SMASHED WRONG CAR

An Illinois farmer has been called upon to settle for damages done to an automobile which he supposed belonged to Pete Weast, of Peoria. The latter's car had whizzed by him a short time before, scaring his team into a hedge fence and breaking the harness. The damage was repaired, Weast apologizing and each proceeded on his way. Then the farmer discovered that one of his horses' feet was cut and the nearer he got to town the angrier he grew, so that when he came upon a new automobile in front of the Danforth house he secured a club and proceeded to knock it into a cocked hat. Then the awful discovery was made that it was not Weast's machine at all, the latter being miles away at the time. The farmer apologized, but that didn't go and he was hauled before 'Squire Snyder by the irate owner and made to settle for the damage.

NEW GEORGIAN MEASURE

City fathers of Atlanta, Ga., are considering amendments to the automobile ordinance introduced by Mayor Pro Tem. Harwell. The main provisions of the Harwell ordinance are as follows: Creation of board of examiners, consisting of two experts and chief of police, who shall examine all applicants for licenses. Owners of automobiles must give bond of $500, recoverable by city for persons injured. All automobiles must carry speedometers. Conviction for violating speed law shall make suspension of license for 30 days discretionary with recorder. Second conviction shall make it discretionary with the recorder to revoke the license. All machines must be numbered, carry lights, visible in front and rear, and shall carry horn or bell or other means of sounding warning. No license to be issued to persons under 18 years of age or to persons lacking in sobriety or discretion. Violations of ordinance subject owner to maximum fine of $200 or 30 days in stockade, or both, in discretion of the recorder trying the case of law-breaking.

BOASTINGS OF A TRAPPER

Allan Peabody, the man who is posing as the phenomenal trapper of motorists who exceed the speed limit, has returned to Boston from New York, much inflated with his own importance, and makes the statement that he will shortly descend upon Chicago, and instruct the police of that city in the wonderful workings of what is claimed to be his perfect system of trapping, but which is, in fact, rather a crude system, one which can easily be counteracted. Peabody does not tell of all his experience in New York, including the case in which he failed to make a conviction, owing to a great diversity in his own evidence and the motor police who made the arrest. It seems that one of New York's finest arrested a motorist who passed through one of the Peabody traps and in court the policeman testified that the car was going 25 miles an hour and Peabody testified it was doing 40, according to his watches. The result was an acquittal. Now Peabody is to descend on Chicago. His system differs not materially from the general run of traps. Three stations are located along a certain roadside, each connected with the other by a push button and telephone. When a car is seen approaching the first station a preparatory signal is sent to the next one, and as it crosses an imaginary line the second signal is given and the watch is started. Should the watch indicate an excessive rate of speed as the car crosses the second line the signal to stop and arrest the offender is sent to the third and last station. This, in brief, is the game, and one which cannot be absolutely correct and reliable.

WASHINGTON WORRIES

Automobilists in Washington, D. C., who frequently drive their cars through Virginia, are somewhat worried over the fact that the regulation and possible prohibition of automobiles in Loudon county is being made the subject of numerous petitions circulated for signatures to be presented to the next legislature of Virginia, asking that laws be enacted either prohibiting their operation within the limits of Loudon county or demanding the enactment of a special law placing the matter under the control of the board of supervisors of the county.

Among Makers and Dealers

EXTERIOR OF THE TRAVELING SHOW CAR OF THE WINTON COMPANY

Joins Fisk—Louis Mansuy has joined the Fisk Rubber Co.'s forces as assistant to J. W. Bowman at the New York sales headquarters.

Hinckley in Line—Freeman Hinckley, son-in-law of Colonel Albert A. Pope, will, it is said, be appointed as manager of the Boston branch of the Pope company on the retirement of Mr. Foss.

Claims an Error—J. A. Cramer writes from Buffalo that he has not signed a contract to handle Marion cars for 1906. He will not be ready to announce his plans until the first of the month.

Kelly With Welch—The Welch people have secured a Boston agent in the person of Will R. Kelly, who has secured the establishment on Boylston street, formerly occupied by the Decauville agency.

Moves the Money Man—The auditing department of the Locomobile company has been moved from the New York branch of the factory. Treasurer Thomas M. Thomas accompanies the department.

Quitting Colonel Pope—The latest sensation in the Boston trade is the resignation of W. J. Foss from the management of the Boston branch of the Pope Mfg. Co., with which company Mr. Foss has been closely identified for the past 12 years. Mr. Foss' resignation is to take effect on November 1. At the same time comes the announcement that Archie Hughes, another strong Pope man who has held forth in Providence, R. I., for over a year, is likewise to retire from his position. Foss and Hughes are to go into the business on their own hook in one of the big cities in the east.

Winton Itinerary—The railroad car the Winton Motor Carriage Co. is using to jump around the country displaying the 1906 models was in Philadelphia, Saturday, Sunday and Monday, after having visited Detroit, Buffalo, Rochester, Boston, Providence and New York. At each place the novel idea made a great hit. The rest of the itinerary is as follows: Pittsburg, October 12 and 13; Columbus, October 14; Cincinnati, October 15 and 16; Indianapolis, October 17; St. Louis, October 18 and 19; Chicago, October 20, 21 and 22; Milwaukee, October 23; St. Paul and Minneapolis, October 24 and 25; Omaha, 26 and 27; Kansas City, October 28 and 29; Denver, October 30 and 31 and November 1. Salt Lake, Sacramento, San Jose, Fresno, San Francisco and Los Angeles will also be visited, the car getting back to Cleveland November 23.

Decauville to Brasier—H. A. Weaver has left the Decauville Automobile Co. to become associated with E. B. Gallaher, of New York, in the importation of the Richard-Brasier cars.

Aster in America—An American branch of the Aster company, of Paris, manufacturer of motors, parts and accessories, has been established at 1591 Broadway, New York. A. T. Myers is the manager.

Closed Boston Deal—The Ranier company has just closed a deal whereby the Morris Tyler Motor Co. has been named as agent in Boston for its product. Mr. Tyler was formerly the Peerless manager in Boston.

To Give Demonstrations—The Gearless Transmission Co., of Glens Falls, N. Y., organized with a capital of $500,000 to manufacture gearless transmission for automobiles and motor boats, under the Davis patents, is about to start one of its demonstrating cars through the west, visiting the makers and dealers in that section.

Locomobile Changes—A. J. Banta has succeeded B. G. Sykes in charge of the Chicago branch of the Locomobile company. Irving J. Morse takes the place left vacant by the resignation of William Morgan, superintendent of the Philadelphia branch. Mr. Morse was formerly identified with the London branch of the company. Banta's place territory will be taken care of by Kenneth M. Blake.

Testing the Packard 24—The 1906 24-horsepower Packard is being given a thorough test on the road. Early in June it made a run from Detroit to Chicago and return, 600 miles, over rough roads, in a running time of slightly under 22 hours. This performance was repeated a week later by different people and on neither trip were there any repairs or replacements, except to tires. Since then the car has been driven from New York to Boston and return and from New York to Philadelphia and return. Its latest feat, driven by W. R. Densmore, was to do the 76 miles from Powers' hotel, Rochester, N. Y., to Buffalo in 1 hour 57 minutes elapsed time, said to be the fastest the route has ever been covered in an automobile.

Holley Pushing Things—Holley Bros. Co., makers of the Holley carbureter, reports that its goods will be used the coming season on Fords, Wintons, Mitchells, Oldsmobiles and Waynes, contracts having been made with the manufacturers of these cars.

Adds Line—The Butler Motor Car Co., of Boston, Mass., agent for the Cleveland and Pierce-Racine cars, has undertaken the agency for eastern Massachusetts for the commercial cars of the Rapid Motor Vehicle Co. of Detroit and Pontiac.

Denial from R. E. Hardy Co.—The R. E. Hardy Co., of New York, maker of ignition plugs and automobile gas engine accessories, wishes to deny statements to the effect that the selling end of its business has been placed in outside hands. It adds that it believes it can best serve its customers through direct relations. The Sta-Rite ignition plugs are made in forty-seven varieties.

Woods Building—Work has started on the new factory of the Woods Motor Vehicle Co., at Twenty-fifth street and Calumet avenue, Chicago. The new building will be five stories and the capacity of the plant will be increased three-fold. It is expected that 500 cars will be turned out in 1906. The move from the old plant at 110 East Twentieth street will be made about April 1.

Kennedy Car Tested—The test given the automobile recently invented by Thomas J. Kennedy, of Cortland, N. Y., is reported to have proved satisfactory and the backers have formed a stock company with $150,000 to put the machine on the market. The company will probably buy the plant of the Ellis Omnibus and Cab Co. and begin the manufacture of automobiles on a large scale. The experimental machine is finished in green, has two seats and several novel features. There are no cams, oil cups or valves. The car can be run on either one, two or three cylinders. There is but one control lever.

Adds Domestic Car—Though Smith & Mabley were the first of the importers to recognize the value of American workmanship and factory methods as applied to motor car manufacture, it was for the Decauville Automobile Co. to take the initiative in adding a domestic car to its imported line. The enormous increase in its selling, storage and repair plant through the building of the great garage at Broadway and Fifty-fifth street, New York, which will be ready for occupancy by November 15, will enable the officers to carry out long cherished ambitions in the direction of broadening their business. Negotiations with the H. H. Franklin Mfg. Co., of Syracuse, which have been in progress for over a month, were concluded last week by the signing of a contract whereby the company becomes the metropolitan agent of the Franklin. The expressions of both sides at the completion of the deal indicate mutual satisfaction and great hopes for the future. The Decauville company has also arranged to enter largely into the exportation and sale of American and im-

Digitized by Google

ported sundries. The building now in course of construction will furnish storage for 250 cars. The lower stories, however, have been so built that four more may be added, which will raise the storage capacity to 500.

Studebaker Branch—Studebaker Bros. have leased the Christian Scientist church property, 137-143 West Forty-eighth street, New York city, and will remodel the property for garage purposes. The building has a frontage of 80 feet and a depth of 100 feet.

Has Whole Building—Albert B. Ashforth leased for the Broadway Reliance Realty Co. the entire building on the southeast corner of Broadway and Sixty-fourth street, New York, to the Autocar Co., which will use it for salesrooms, offices and repair department.

Stock Company Now—B. A. Miner, the Hartford, Conn., agent for the Knox and Pierce Arrow motor cars, has organized his concern into a stock company, and H. C. Judd, who owns the land at the northeast corner of Allyn and High streets, will erect a building for him.

Increase Capital—A call has been issued for a meeting of the stockholders of the Crawford Automobile Co. to pass on the matter of increasing the capital stock of the company from $50,000 to $100,000. Work is about to begin on the addition to the plant. The new wing will be 100 by 56 feet, three stories, equipped with elevators, offices, etc.

Franklin Output—The H. H. Franklin Mfg. Co., of Syracuse, N. Y., is reported to be planning to turn out from 2,000 to 2,500 cars next year and is hiring all the skilled mechanics it can get, 850 men now being employed. Upon three of the cars the prices have been advanced $150, $300 and $500, respectively. The company is building most of the four-cylinder light touring car type.

Want Repairs, Too—There is quite a movement on foot among automobilists in Pittsburg to secure more satisfactory rates at the garages for storage, etc. At present the rate for dead storage is $8 per month and for live storage $30 per month. The motorists believe that this latter charge should include a guarantee for all reasonable repairs, except tires. As the demand for storage is increasing rapidly, it is quite likely that the dealers will accede to this request next year, for, although they claim there is little money to be made in live storage in Pittsburg, they find that it brought them a big lot of sales.

Show Dates—There will be nine big shows this winter—three in this country, one in France and five in England. Two of the American shows will be held the same week—January 13-20—the A. L. A. M. in Madison Square garden, New York, and that of the Automobile Club of America in the armory of the Sixty-ninth regiment, New York. The third one will be the national show of the National Association of Automobile Manufacturers in the Chicago Coliseum the week of February 3-10. The first of the foreign exhibitions will be the Olympia, held in London November 17-25, and the Stanley, which will run opposition during the same week. The Paris show will be held the week of December 8-24, while the Crystal Palace show in London opens January 26 and runs through to February 3. The other English show—at Agricultural hall—will be held the week of March 24-31.

Erecting Plant—The Western Malleable Steel Co. is erecting a plant at River and Clark streets, Detroit, and will make a specialty of automobile work, for which a special grade of European iron will be imported and treated by a foreign process. The enterprise is backed by Michigan capitalists and is under the management of Harry Gordon.

Incorporated—The business conducted by William Roche at 52-54 Park place has been incorporated and is now owned by the William Roche Dry Battery Co., which has a full paid up capital of $25,000. The officers of the company are: William Roche, president; Ernest A. Lowe, vice-president; C. Laton Ford, treasurer; William C. Hubbard, secretary.

Ready in Rome—The Long-Turney Co., just incorporated at Rome, N. Y., for the manufacture of automobile radiators, hoods, spiral tubing, brass and copper monograms and other supplies, expects to start operations in 3 weeks. The machinery has been ordered and is on the way. At the start twenty hands will be employed.

Change Site—The Mar-Del Mobile Co., Baltimore, which announced its intention of building a garage on the east side of Cathedral street, has decided to change its site for the structure and has acquired the lot at the southwest corner of Mount Royal avenue and Charles street. Quarters are to be planned on the second floor for the Automobile Club of Baltimore.

Gear Company Prospers—The Syracuse Rawhide Co., manufacturer of gears, at a recent meeting at Syracuse voted to increase its capital stock from $25,000 to $100,000. Henry J. Ormsbee has been offered the position of general manager of the company and has the offer under consideration. It is the plan of the concern to install additional machinery and increase its output. The company also has under consideration the erection of a new factory.

They Wonder—Officials of the American Locomotive Co., of Schenectady, N. Y., profess to know nothing of the American Locomotive Automobile Co., which has filed articles of incorporation with a capital stock of $300,000.

Wants Site—A company, which manufactures gasoline engines, desires to locate in Wauseon, O. The company wants a free site, with the understanding that if the company fails to pay a certain amount of wages for 5 years, then the site will revert back to the city.

Olds New York Agency—For the coming season the Oldsmobile agency in New York will be handled by the Oldsmobile Co., of New York. The agency will be owned by John T. Cutting, who introduced the Cadillac in New York. The salesroom has been located at 1653 Broadway.

New Building—The Detroit Auto Specialty Co., now at 16 Sherman street, has commenced the erection of a large factory at Greenwood and Baltimore avenues, near the plant of the Cadillac Automobile Co. The company employs thirty men now, but when it moves into the new place November 10 it will increase this number to 200.

De Dietrich Deal—Baron Adrien de Turckheim and W. M. Letts have just concluded a deal whereby the American agency of the de Dietrich will at once go to Allen Halle & Co., of New York, who formerly imported the Mercedes. The de Dietrich garage on West Forty-eighth street is to be closed and new hearquarters opened on Fifth avenue.

Want Makers Bonded—Those farmers down near Mexico, Mo., have held the anti-automobile meeting that was called some time ago. They wanted the automobiles forbidden the use of country roads, but compromised by drafting thirty-six pages of resolutions to the state legislature, recommending, among other things, that the automobile makers be required to give bond for any damages which may result from the use of their products.

PIONEER MAKERS—ELWOOD HAYNES

Frank Nutt driving a 50-horsepower Haynes car into fourth place in the American eliminating trial for the Vanderbilt cup race calls to mind the first run ever made by an automobile constructed by Elwood Haynes. That was in July, 1894, and the machine, claimed to be the first gasoline automobile constructed in the United States, made its debut on the roads running out of Kokomo, Ind., where is located the plant of the Haynes Automobile Co. The car was towed out into the country behind a horse-drawn carriage in order to avoid the crowds that immediately assembled on the streets when the rig was taken out of the shop. Once out on the highways, the motor was started by throwing it into clutch with the carriage, and then pushing the latter a short distance. The clutch was then disengaged and the motor continued to run. With the car under headway, three persons mounted into the seat and rode for a distance of about 2 miles further into the country. The car was then stopped, turned around, and started once more for Kokomo, running the entire distance—about 5 miles—carrying two persons without a stop. This demonstration proved that the motor was of insufficient power, especially on the hills, as the total weight of the car was about 820 pounds. The speed on the level was only about 7 or 8 miles an hour. The 1-horsepower motor was soon afterwards replaced by a 2-horsepower motor, and the machine equipped with 36-inch wheels and 2-inch pneumatic tires, which increased its speed to about 12 miles an hour. The best time made was 5 miles in 26 minutes over a country road, which was considered good.

From his boyhood days, Mr. Haynes had a mind mechanically bent. He was born at Portland, Ind., in October, 1857, his first schooling being secured in the public schools of that place. He early developed a decided taste for the sciences and their application to practical affairs and at the age of 18 he had a fairly good knowledge of elementary chemistry and elementary physics. At the age of 20 he entered the Worcester Polytechnic institute at Worcester, Mass., from which he graduated in 1881.

For a number of years after graduating Mr. Haynes was in the natural gas business, and while engaged in this the idea came to him for the first time of building a vehicle which would successfully replace the horse on the highway. In driving from one gas well to another while following his profession, the need of such a vehicle was forcibly impressed upon his mind when he noticed that the long drives tired his horse so that he could only go home slowly in the evening, even though the roads were good. The idea once planted in that fertile brain of his, he turned the scheme over and over in his mind during 1888 and 1889 but it was not until 1893 that he was able to put his plans into execution and begin the actua construction of a self-moving machine. H considered the feasibility of electricity an rejected it; then he went over the steam proposition with the same result, finall settling on gasoline as being the mos feasible basis for power, all things con sidered. The gasoline motor at that time however, was a very crude affair and no at all adapted for driving a motor car. Th lightest obtainable on the market at tha time was a single-cylinder, two-cycle gaso line engine of 1 horsepower built by th Sintz Gas Engine Co., of Grand Rapid Mich. Mr. Haynes' first idea was to buil an extremely light car, weighing not mor than 300 or 400 pounds, but after purcha ing the motor and noticing its terrific vibra tion when running, he decided to build much heavier machine. Materials were diffi cult to obtain at that time, but after con siderable trouble the car was finally assem bled. The framework was made of stee tubing brazed into steel castings, whic Mr. Haynes believes, is the first applicatio of steel castings to the construction of th automobile.

The year following the trial of the fir car a partnership was formed between M Haynes and Mr. Apperson and continued fo about 2 years when a corporation was organ ized under the name of the Haynes-Appe son Co. September 1 there was another change and now the Haynes car is manu factured by the Haynes Automobile Co., M Haynes still retaining the presidency bu turning the general managership over V. E. Minich in order that he may hav more time to devote to the mechanical de tails of the car made by his compan

BRIEF BUSINESS ANNOUNCEMENTS

Dayton, O.—Joseph Wysong is sole owner and manager of the Day and Night Auto Co.

Dalton, O.—The Miami Motor Car Co. has added a large office on the second floor of its garage.

Lansing, Mich.—The Motor Car Co., of Detroit, has been incorporated with a capital stock of $150,000.

Stoughton, Mass.—James Lehan has erected a garage and has the agency for the Pope line of cars.

Two Rivers, Wis.—The Wisconsin Automobile Supply Co. has been recently established here with a capital stock of $5,000.

Westfield, N. Y.—An automobile factory is endeavoring to secure a location here, good railroad facilities being the chief inducement.

Newton Center, Mass.—H. D. Church has purchased from J. W. Crowell the garage situated at Commonwealth avenue, near Walnut street.

Pontiac, Mich.—F. W. Oliver, of South Bend, has submitted a proposition to the city council to build a factory here to make automobile tires.

Findlay, Ohio—The Detroit Automobile Co., which was recently organized with a capital stock of $100,000, is endeavoring to secure a location here.

Sioux City, Ia.—H. Bernard Hallam, formerly of Seattle, Wash., has opened a garage at 616 Fifth street. He will represent the Reo in northwestern Iowa.

Rochester, N. Y.—It is reported that the Covert Motor Vehicle Co.'s plant will be moved here from Lockport. Most of the stockholders are Rochester people.

Newport, R. I.—Thomas G. Owen, expert machinist, has gone into the automobile business, opening a garage at 379 Thomas street. He has taken the agency for the Rambler.

Hartford, Conn.—Two patents have been granted to the Electric Vehicle Co. during the past week, one for automobiles and self-propelled vehicles and parts thereof, and the other for motor boats and parts thereof.

Washington, D. C.—The National Automobile Co. has filed a lawsuit against the Cahill Automobile Co. to recover possession of a Buick touring car, valued at $1,400, which the plaintiff contends the defendant unlawfully holds.

Pittsburg, Pa.—The American Motor Co., which was recently organized in Pittsburf, is getting ready to build a large three-story brick garage in Diamond street. It will be within a stone's throw of the heart of the office section of the city of Pittsburg.

Milwaukee, Wis.—The Kruger Mfg. Co. has been organized to build automobiles and conduct a general manufacturing and repair business. A four-story building is to be erected by the company at the foot of Biddle street. Julius Kruger is the president of the company and Ross McCoy treasurer.

Coldwater, Mich.—C. R. Johnstone has secured the local agency for the Jackson automobile.

Sea Breeze, Fla.—The Clarendon garage, connected with the Clarendon hotel, will be opened on December 1.

Boston, Mass.—Charles Blaney, late with the Boston Ford agency, has accepted the Boston agency for the Corbin car.

North Attleboro, Mass.—J. P. Ballou is the agent for the Pope cars and manages a complete garage at 175 Washington street.

Jefferson, Ia.—Franklin & Louk have dissolved partnership in the Jefferson garage, leaving Charles Louk as sole owner and proprietor.

Minneapolis, Minn.—Work has started on the new garage of L. H. Fawkes at 111 Sixth street. It will be 50 by 150 feet and is expected to cost $16,000.

Detroit, Mich.—It is possible that the Union Trust Co., executor of the Alfred E. Brush estate, will build an automobile garage at Woodbridge and Brush streets.

Columbus, O.—Local capital has bought the Springfield Automobile Co., of which C. C. Bramwell is the head, and will move it to this city. Mr. Bramwell will continue as general manager.

RECENT INCORPORATIONS

Omaha, Neb.—The Karbch Automobile & Vehicle Co. has been incorporated with a capital stock of $75,000. The firm will engage in the manufacture and sale of automobiles and other vehicles.

Albany, N. Y.—The Buffalo Auto Body & Trimming Co., of Buffalo, has been incorporated with a capital stock of $25,000, to engage in the manufacture of automobile bodies and seats.

Albany, N. Y.—The Esco Mfg. Co., of the Bronx, has been incorporated with a capital stock of $10,000. The company will engage in the manufacture of motors, vehicles and cycles.

Albany, N. Y.—The Barnes Gear Co. ,of Oswego, has been incorporated with a capital stock of $50,000. It will manufacture steering gears and supplies for automobiles.

Boston, Mass.—The Courier Motor Car Co. has been incorporated with a capital stock of $15,000. The company is to engage in the sale of motor cars.

Augusta, Me.—The Gearless Transmission Co. has been incorporated with a capital stock of $500,000, to engage in the manufacture of motor vehicles.

Lansing, Mich.—The Matheson Motor Co. has been incorporated and has increased its capital stock from $600,000 to $1,100,000.

Columbus, O.—The King Mfg. & Garage Co., of Springfield, has been incorporated with a capital stock of $20,000.

Albany, N. Y.—The Griswold Mfg. Co. has been incorporated to deal in automobiles. The capital stock is $25,000.

Albany, N. Y.—The Greene Motor Car Co., of Newark, N. J., has been incorporated with a capital stock of $100,000.

St. Joseph, Mo.—The St. Joseph Automobile Co. has been incorporated with a capital stock of $2,000, all paid.

Austin, Tex.—The Waco Auto & Electric Co. has been incorporated with a capital stock of $5,000.

Los Angeles, Cal.—The Golden State Motor Car Co. has increased its capital stock to $500,000.

Lawrence, Mass.—A brick garage has been erected by the Broadway Motor Car Co. at 174 Broadway.

Washington, D. C.—E. A. Beekman has filed a lawsuit against the Auto Transit Co. to recover an account of $325.

Bay City, Mich.—W. F. Flynn, manufacturer of the Falcon motor car, is seeking a location here for a new factory.

Boston, Mass.—The Welch Motor Car Co. is to establish a branch in this city. W. J. Kelly is to assume the management.

Sioux City, Ia.—The Hathaway Automobile Co. reports having sold eighty-eight Cadillacs in and about Sioux City this season.

Madison, Wis.—Among the incorporations is that of the Wisconsin Automobile Co., of Two Rivers, which has a capital stock of $5,000.

Cincinnati, Ohio—The Acme Motor Co. has purchased a piece of ground on Sycamore street on which a modern fireproof garage will be erected.

Sioux City, Ia.—William Warnock, on Fourth street, is representing the Rambler, Ford and Olds in northwestern Iowa and northeastern Nebraska.

Philadelphia, Pa.—F. C. Michaelson is to build a garage, two stories high, 23 by 42 feet, on the west side of Fifty-first street, at a cost of $2,000.

Kenosha, Wis.—The Badger Brass Mfg. Co. is building an addition to its plant, which will practically double the size and capacity of the Solar lamp factory.

Sea Breeze, Fla.—Egan & Grinnell, who have had a successful season with their garage at Narragansett Pier, R. I., will inaugurate the Clarendon Auto Garage here.

Somerville, Mass.—A commodious garage, with a complete repair outfit, has just been opened. It is situated at 15 Glen street and is under the management of H. B. Ruggles and John E. Rogers.

Milford, Mass.—Two garages have been opened here. The Milford Auto Station is under the management of Frank H. Marshall and the Milford Automobile Machine Co. is run by W. Hadley, F. S. Howard and W. H. Baker.

Detroit, Mich.—The City and Suburban Homes Co. sold two factory sites on the northeast corner of Maybury, Grand avenue and the Grand Trunk Railway to the Hayes Mfg. Co., manufacturers of automobile parts, and to the Northway Motor Co. of this city.

Detroit, Mich.—Holly Brothers are erecting an addition to their factories at 672 Beaubien street. The new building is 25 by 90 feet and is to be a brick structure with concrete floors. The company's offices will be located upstairs, while the first floor will be used for experimental work.

WINTON

Economy of Up-Keep vs. Wasteful Working Parts

UP-KEEP expenses are **increased** by the use of Wasteful Working Parts. For instance, the Double Chain Drive.

Cars using the Double Chain Drive have two **exposed** chains and four **exposed** sprocket wheels.

And, since these chains and sprockets are **always exposed**; since they cannot be protected from dust, dirt, grit, mud and rain; and, since being unprotected, they **cannot be lubricated**—except by axle grease that merely picks up dirt and grit and grinds it into the chains and sprockets, thereby **eating them up**; it stands to reason that—

These chains and sprockets **wear fast,**

1. Causing friction, backlash, climbing, binding, jumping and breaking; hence

2. Using up much of the motor power that should be used in driving the road wheels; therefore **wasting money** that you spend for gasoline and oil; and

3. Necessitating the **purchase** of new chains and sprockets—another **bill of expense.**

Also, double chains and quadruple sprockets add greatly to a car's bulk and weight, are unsightly, prevent the use of handsomest body designs and endanger the safety of every woman who gets in and out of the tonneau over the awkward sprocket boxes.

Now, what about the Winton Model K drive?

In this car the engine's power is carried **direct** from motor to driving axle through **one, single, flexible, carbon steel drive shaft and two** hardened and ground universal couplings. That means strength, cut-down friction, clean body lines, safety to tonneau passengers and simplicity.

These universal joints are **enclosed** in absolutely tight metal cases that keep dirt, dust, grit, mud and rain OUT, and lubricant IN. Yes, IN, because these cases contain lubricant and, therefore, these joints are **always oiled.** That means friction, wear and noise PREVENTED, and the engine's power USED in driving the car and not in overcoming friction or resistance.

But—note this. The direct shaft drive **can be ruined** by being subjected to sudden, violent strains. For instance, by the non-oiled clutch, sliding gear transmission system, which, when thrown in, wrenches the drive shaft abnormally.

But there is **no such danger on the Winton.**

The new Winton Model K has an individual clutch transmission. Its clutches run **always in an oil bath.** A film of oil between the clutch cones must be squeezed out before the clutch takes firm hold, and this oil film permits the cones to slip intentionally, just for a second, when the power is applied. That **prevents wrenching.** Then all the engine's power is **directly used** in propelling the road wheels, and, meanwhile, the drive shaft and universal joints have begun to work gradually and have suffered **no strain.**

The individual clutch transmission is the **only** transmission recognized by mechanical science as **legitimate.**

The use of automobile power reaches its maximum efficiency—as you can readily see—when the individual clutch system and the single, direct, flexible shaft are **used in conjunction.**

And you get this perfection on the Winton **only.**

There are other ways in which the new Winton Model K cuts down Up-Keep expenses. Let us tell you all about them. Catalog No. 2 is ready.

Model K—Four cylinder, vertical, water cooled; 4¾-in. bore; 5-in. stroke. Shaft drive. Individual clutch transmission. Winton Air Governor. Most approved systems of lubrication, ignition and carburation. Seats six. $2,500, f. o. b. Cleveland.

YOU may think that there is more theory than practical value in our claim that the Unit Power Plant and Three Point Support of the STEVENS-DURYEA deliver more power to the wheels per hundred pounds weight of the car, but —think a minute. Our engine isn't as large as the engine in some of these other cars that we beat so easily—we aren't running it at abnormally high speed nor high compression in order to squeeze the utmost power possible out of it—we don't claim over twenty horsepower and we aren't getting over twenty horsepower, yet everyone knows that for its size, the Stevens-Duryea is the fastest car on the road, and is the best hill climber on the market to-day. If we haven't got as big an engine as the other fellow, how do we produce more RESULTS unless our claim as to DELIVERED horsepower is based on fact?

A little consideration will show you that there must be "Something to it, after all."

WHEN YOU PAY MORE

Model 4B

$1500

for a touring car or runabout than **our** price, you are paying for features which you get without extra charge in the

An ideal touring car at an ideal price. 18-20 h. p. (4-cylinder vertical motor), $1,500. One h. p. for every 85 pounds of weight. *No radical features or untried devices for which you will have to pay for the experiments.*

It embodies the best features of the most famous cars, but it is different in at least one essential—price. A 4-cylinder touring car at $1,500 seems unusual, you say? It is *more* than unusual—*it's wonderful.*

MITCHELL

It is not only **"the car you ought to have at the price you ought to pay"**

Model 2B

$750

2 cylinder, 9 h. p., vertical motor, mounted in front. This Runabout is as carefully designed, as up-to-date and smart in appearance as any three or four thousand dollar car ever built. It has ample power for all conditions of road and its hill climbing abilities are unsurpassed. It is *all* that *any* man may want in a Runabout.

It is **more.** It is absolutely the best car—the most perfectly constructed—the most simple to operate and the most stylish in appearance on the American market. You cannot **possibly** do better than to buy a **Mitchell.**

Peerless

1906 Peerless at the end of the Buffalo trip

The Peerless 1906 Model

is our attempt to make the best car that can be built. Frankly, we are proud of it. The new car has been tested out under the most difficult conditions we could devise. After days and weeks of the hardest kind of tests on the hills and on the level, in which it came out with flying colors in every case, it was sent 400 miles over the road, through the mud. Twenty-eight miles an hour from Cleveland to Buffalo over rough and muddy roads with four people in the car is certainly more than creditable for the first car finished. Especially since it came back to the factory in the same perfect condition that it went out, and that without an adjustment.

SEND TODAY FOR 1906 INFORMATION

Surely the new model of the same car that holds the stripped touring car record of 58 3-5 seconds and the 1000 mile non-stop record, ought to be thoroughly considered if you are looking for the best car.

THOMAS 1906

A Personal Statement from Mr. E. R. Thomas

"Hitch Your Wagon to A Star"

My friends have long known that it has been my cherished ambition to build the best car in the world or, at the very least, one of the greatest.

I do not mean the fleeting reputation gained by enormous outlays for advertising and the performance of road and racing stunts by highly paid employees with special cars or well groomed individuals of social and business prominence always accompanied by factory experts. But I do mean the permanent reputation founded by actual performance in the hands of the general public which comes solely from intrinsic merit.

Years ago—surrounded by noted mechanical talent—we built one of the greatest bicycles of the world, which was better than any foreign continental production. The principles of automobile construction are the same except mechanical power is substituted for human. Since 1897 I have been building vertical gas engines by the thousands. Then why not at least one of the best automobiles?

I knew that with us it was only a question of design, material and time. It was not a question of experience in fine workmanship. We had that. Nor was it a question of profit for that would surely follow.

In 1904 daylight began to appear. Two cylinder vertical motors were the vogue. I went one better and built three at the same price. It was far superior to any two cylinder proposition on this side of the world or the other.

Design was greatly improved, crude and accessory manufacturers improved their material, the car proved highly efficient and the stars we had "hitched to" seemed nearer and brighter. It was in the year that I designed the safety device which has saved lives—also the curved dash with small tool lockers and the chain pull that equalizes the strain on the main bearings. We also used chain oilers on the crank and transmission shafts.

In 1905 we built a four cylinder car which, with nominal advertising, no traveling agents, and no performance of road or racing stunts, requiring special cars and highly paid factory experts, we again caught the public favor and quickly sold four hundred big touring cars—no more and no less. We were compelled to refuse many additional orders, some with bonuses above the price of from $250 to $750.

It was in this year I patented the now famous dust proof body and introduced lockers and rails for wraps and many other features of comfort and efficiency.

The result in every way exceeded my most sanguine expectations and the star shone still brighter and was much nearer.

Our success was so great I have about completed a new model fire-proof factory, constructed entirely of concrete, steel reinforced. The mechanical equipment has been greatly increased. The capacity is one thousand fifty horsepower automobiles.

I have the same superb mechanical force who are inspired by the same ambition and who are co-operating with me loyally and energetically to realize our high ideals and which we believe will be fully realized in the 1906 Thomas Flyer, which has been greatly improved in every detail of workmanship, material and design—notably:

Forged I beam axles—great, strong steering knuckles—steering apparatus all forged. No brazed joints. Cross steering rod behind front axle. Large separate motors. Mechanically operated valves opposite sides. Improved radiator fan and pumps. A disc clutch that will not slip under any condition when engaged. Four forward speeds—with one Hyatt roller and five Hess Bright bearings. Altogether fifteen Hess Bright ball bearings, one Hyatt roller and two ordinary ball bearings—twenty-one anti-friction bearings in all. A beautiful new dash and body seating five or eight as desired. Four great big wide brakes—the foot alone will stop a loaded car on a twenty-five per cent down grade.

I am very proud of the New 1906 Thomas Flyer—and I believe the American public will be proud of it. The best foreign cars may have some few unimportant details that we haven't got—and we have some important ones they do not possess. But we have put the design, material, workmanship and money into this car to make it at least equal to the highest priced car in the world, and I believe that the verdict of a just people will, based upon intrinsic merit solely, place the 1906 Thomas among the world's greatest and best, and as such I present it.

E. R. THOMAS,

For The E. R. Thomas Motor Company.

A SOLAR SERMON

The Fatal Motor-Car Accident to Mr. Henry Winch.

Mr. Henry Winch, the Unionist Candidate for South Norfolk, died at the Cranked Billet Inn, near Basingstoke, on Tuesday, August 29, from injuries received in a motor accident on August 10.

Mr. Winch was travelling to Yateley Grange, in Hampshire, and on reaching the curve of the road at which the Cranked Billet Inn stands, he mistook the road and drove straight into the wall of the inn.

His skull was fractured and he lay unconscious for over eighteen days.

It is stated that the accident, which happened at night, was entirely due to the fact that Mr. Winch would not use acetylene lamps, because he said they frightened horses. The moon was shining on the wall of the inn and looked like a white road. The road itself was in shadow.

The photos show the Cranked Billet Inn, the car which the car struck, and the car after the smash.

Need we make comment?

BADGER BRASS MFG. CO.

KENOSHA, WISCONSIN

NEW YORK OFFICE 11 WARREN STREET

1906 Stoddard-Dayton

MODELS C AND D

30-35 h. p. Touring Car 15-18 h. p. Runabout

To the Trade—This FORETASTE of the 1906 Model D is issued at this time to advise our friends of the natural developments which come from experience in all parts of this great country of ours, which experience is digested with an eye single to the pleasure and comfort of purchasers of the Stoddard-Dayton.

Dayton, Ohio, U. S. A., October 1, '05. THE DAYTON MOTOR CAR CO.

MOTOR—The Engine is 4-cylinder vertical, water cooled, 4½ inch bore, 5 inch stroke. Cylinders cast separately and heads integral. Valves mechanically operated. Cam shaft and pump gears entirely enclosed and running in oil. Bearings between each crank. Lower half of crank case removable, leaving bearings intact. Inspection covers in upper half of crank case. Positive and splash lubrication.

TRANSMISSION—Sliding gear. Gears running in oil. Case, oil and dust proof. Three speeds and reverse. Timken roller bearings throughout. Direct drive on high gear. Double universal joint between end of propeller shaft and transmission, and also between transmission and clutch, eliminating all end thrust and strain on the bearings. Cone clutch, large diameter, lined with leather.

LUBRICATION—Mechanical-pressure feed oiler. Each feed can individually be worked by hand in case of emergency. Bearings for wheels, rear axle and propeller shaft packed in grease sufficient for 2,000 miles.

IGNITION—Jump spark, storage batteries, coil on dash. Timer on vertical shaft, hardened steel contacts. Concealed wiring.

CONTROL—Spark and throttle levers situated just underneath the steering wheel, operated by the fingers without removing the hand from the wheel.

Two foot pedals, the left one operating the clutch only, the right operating the transmission brake and clutch.

Change gear lever on the same shaft as emergency brake lever and is of the selected or H slot type, thereby enabling the operator to change gear without necessitating any intermediate steps.

BRAKES—Three, internal expanding, large diameter and wide face, encased and protected from dust and mud.

Brakes on the rear wheels rigidly connected with the hubs, and are of the same type and size as transmission brake. They are interconnected with the clutch.

Transmission brake shoe is interchangeable with those on the rear wheels.

FRAME—Pressed steel made from high carbon, hot rolled stock. Motor and transmission carried on dropped subframe reinforced at sides. Drop forged spring hangers.

FRONT AXLE—Front axle, I beam section with drop forged yokes, integral with the axle and free from welds.

Drop forged steering spindle and arms. Knuckles have hardened steel bushings and bolt.

REAR AXLE—Clutch drive type. Spur gear differential with case hardened steel gears. Differential casing has extended hubs running in Timken roller bearings. Wheels have Timken roller bearings and run on steel sleeves extending from bevel gear casing. Driving shaft has no weight to support and simply transmits power to wheels. Differential removable without taking off wheels. Propeller shaft entirely encased in heavy drawn steel tubing. Casing supported at forward end by ball and socket sliding sleeve, hung from cross member on frame, and therefore acting also as torsion lever.

All bearings and bevel gears adjustable.

SPRINGS—40 inch front, 50 inch rear. Single Elliptic, 2 inches wide, made from the best crucible analysis steel.

WHEELS—Artillery 32 x 4, Timken Roller Bearings. 12 spoke front, 14 spoke rear. Spokes made from first-class second growth hickory.

TIRES—Any standard American make.

BODY—New design, 4 inches wider in tonneau seat, retaining artistic lines of 1905 model. Side entrance tonneau; divided front seat; seating capacity, five people.

FINISH—Trimming and painting done in our own shops, under our own supervision. Standard color, the well known Stoddard-Dayton pearl gray, but will paint and trim to customer's own specifications if desired.

EQUIPMENT—Horn, two oil side lamps. Complete set of tools, tire repair outfit and pump.

MISCELLANEOUS INFORMATION—Wheel base, 102 inches; thread, 56 inches. Gasoline capacity, 15 gallons. Each car will be equipped with metal dust pan or apron, protecting all parts under car from mud and water.

PRICE—$2,250.00, f. o. b. Dayton, Ohio, U. S. A.

RUNABOUT—Model C. Four cylinder, water cooled, 15-18 H. P., sliding gear transmission, three speeds forward and reverse, shaft driven rear axle, 80 inch wheel base, wheels, 30 inch. Price, $1,250.00.

Our regular 1906 Catalogue, giving full description and illustrating the same, will appear later, when it can be executed in artistic form.

A record of your name will secure a copy.

Dayton Motor Car Co., Dayton, Ohio

Type G 1906

4-Cylinder Touring Car

Four-cylinders. Air-cooled. Shaft drive. Sliding gear transmission. Three speeds and reverse. New and perfect disc clutch. Force feed oiler on the dash. 4 or 5 passengers. Side doors. 88-inch wheel base. 12 "*Franklin* horse-power." 1200 pounds. 35 miles per hour. Full head and tail light equipment. $1,300.

Details of construction on pages 46, 47, 48 and 49.

To the great majority of motorists this is the most interesting and attr tive car in the whole motoring field for 1906.

The ideal light family touring-car.

Light in weight, small in bulk and operating cost; but big in strength, capacity and performance.

Its 12 "*Franklin* horse-power" does all that any 20 horse-power car, except a *Franklin*, will do; does more than most of them; does what some of the highest-powered highest-priced cars will not do.

It carries 4 or 5 passengers actually 35 miles an hour.

It takes hills on the high gear that would balk many cars of much higher rating.

The rear seat is more than wide enough for grown people. Add a boy or girl and it is just right.

It has the lines and looks of a big car. Being s driven its four cylinders are placed "fore-and-aft" unc long rounded hood, the same as in Type D.

You can buy a bulkier and heavier car or one of h nominal rating for less money. But you cannot buy an car that will do what this does for anywhere near the mc

It's the car of the year.

It will be the ideal light car of years to come.

FRANKLI

Four remarkable

Type G: The new Light Ideal Touring-car Shown above.

Type E: Gentleman's Roadster. The best-built, ablest runabout in the world. Shown opposite.

Type D: The finest high-power, 4-cylinder, American road touring-car. Shown on page 48.

Type H: The new 6-cylinder, top-notch flyer. Shown on page 49.

THE MOTOR: Under hood. In **TYPES E, G and D,** 4 vertical cylinders. In **TYPE H,** 6 vertical cylinders. Bore and stroke: In **TYPES E and G** 3¼x3¼. In **TYPES D and H** 4x4.

Hood can be instantly removed, leaving motor entirely exposed.

Cylinders are cast separately and so designed that the metal is evenly distributed, thus insuring a casting free from strains and one that will remain permanently round. Cylinders are bored, seasoned and then ground, thus insuring a straight and round cylinder.

Pistons and cylinders are cast to a special analysis, insuring a very tough and close-grained iron; thereby doing away with loss of compression due to porous iron. Three eccentric rings ground round after cutting are fitted to each piston.

Crank shafts are made from the same analysis stock as in the past, as we have never had a broken shaft. Every bearing on the shaft is ground to size.

Wrist pins are hardened and ground to size.

Babbitt bearings are used throughout the crank shaft.

All gears are enclosed and hardened.

Governor parts are all enclosed.

No parts of the motor require hand lubrication. By removing four screws the crank shaft, connecting rods and main bearings are exposed to view.

All valves are exposed, are mechanically operated, and are easily removable for inspection.

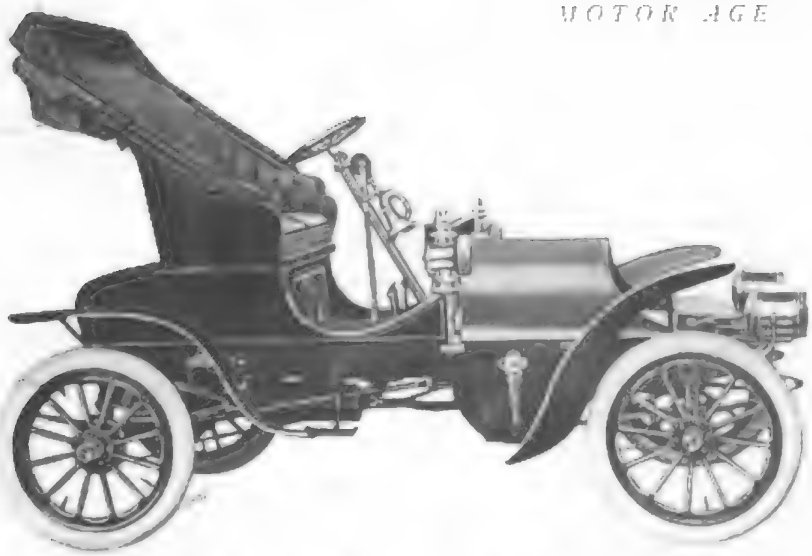
AUXILIARY EXHAUST: A port with valve at bottom of the stroke lets the hot high-pressure gases out before the main e valve opens; thus reducing back pres maintaining the combustion chambe temperature of maximum efficiency.

It increases the power of the en keeps the exhaust valves from gettin and pitted. It keeps carbon deposi the combustion chamber almost co It positively keeps spark plugs from It allows the use of graphite lubric the engine.

COOLING: Direct air-cooling. I **E** it is natural; with no fan. In TY suction-fan wheel is used in rear o In **TYPES D** and **H** there is also the front. It is gear driven with no chains to run off or stretch.

IGNITION: Jump spark, with dry arranged in two sets which may be

Digitized by Google



Type E 1906

4-Cylinder Runabout or Gentleman's Roadster

Two passengers only. No tonneau can be attached. 12 "*Franklin* horse-power," 4-cylinder, air-cooled engine. Wheel-base 81½ inches, 7½ more than last year. Makes the car roomier, distinctly more graceful; and easier riding. Force-feed oiler on the dash. Change lever placed inside the car and forward. More convenient—especially when top is on; and handsomer. 1100 pounds. Combination ironing for canopy, cape or victoria top and glass front—a decided improvement. 40 miles an hour. Full head and tail light equipment. $1,400.

Details of construction on pages 46, 47, 48 and 49.

The ablest, speediest, most luxuriously-built runabout ever built. This year it is handsomer, easier, more remarkable than ever.

As a business runabout; a superintendent's car: or for a doctor or other professional man; for a suburbanite; for 2-passenger touring; or as a speedy roadster for the owner of a big touring-car, there is nothing to compare with it.

Not only its astonishing speed and hill-climbing ability; but its great strength, extreme mechanical refinement, responsiveness and elegant simplicity combine to make it virtually an independent type and the only example of its type.

The material and workmanship employed equal that of the best-made high-priced touring car.

It would be a mistake to class this car with the ordinary runabouts. Buying it by the pound, its price looks high; but judged by ability, amount of service rendered, and satisfaction given, there is no better vulue. In the long run it is the most economical of runabouts.

We will send on request a book more completely describing this car and showing its appearance with glass front and various tops.

NEWS for 1906

continued on next page

every=day=in=the=year cars

Improved oiler; carburetor; clutch; brakes and bearings. More convenient levers. Better protection of parts.

Franklin Air-cooling. 4 and 6 cylinders.
Lightness. Strength. Springs.

dependently or together. Cells are carried on running board in mud and water-proof box. Spark coil is on dash. All wiring is enclosed and protected from dirt, oil and moisture. Timer contact is made by roller, thus doing away with all wear and insuring a long life.

CONTROL: Spark control is on wheel column. Throttle control is on steering wheel. The driver has complete control without moving.

LUBRICATION: A sight, force feed mechanical oiler on dash in sight of operator furnishes oil for all parts of the motor. Transmission gears are enclosed in oil-tight case and run in bath of oil. Rear axle differential and bevel gears are enclosed in oil-tight housing and run in oil bath. Universal joints are protected from dirt and supplied with oil and grease cups easily accessible.

The oil pump is run by a wire belt which will not slip from spilled oil, and will not stretch.

CARBURETOR: Automatic float feed. Gasoline enters from lower side of carburetor and is strained through wire gauge before entering float chamber. Dirt and water are collected in a trap, which can be entirely removed or easily cleaned, without disturbing any other part of carburetor.

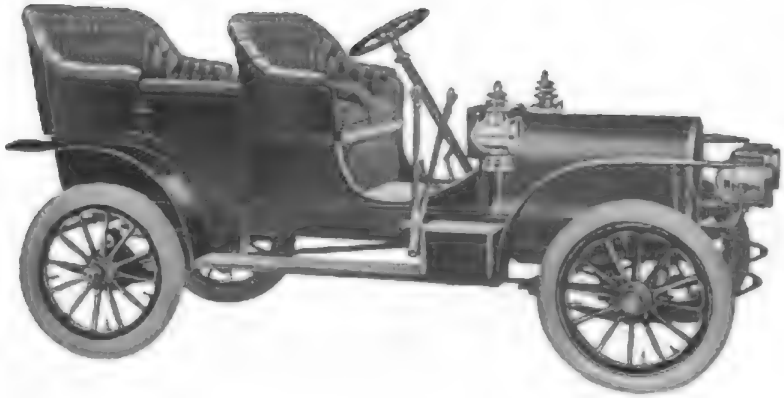
A by-pass operated by the throttle supplies auxiliary air in proper proportions. This by-pass being mechanically operated, does away with springs, separate air control and a multiplicity of other parts. All connections are made with ground joint unions.

We manufacture our own carburetor. Many carburetors purchased on the market and which give satisfaction on ordinary motors are not efficient enough for *Franklin* motors.

CLUTCH: A disc clutch perfected in all details allows the car to be started slowly, easily and without jar. A slight oil film carried between the discs makes the changes from one speed to another unnoticeable. There is no slipping after engaging.

DRIVE SHAFT: A bar of nickel steel of square section and of ample strength. Though designed to stand rough usage this shaft is the weakest member in the entire power transmitting line—the part most likely to break or bend. The advantage of this is that all gears and expensive parts are insured against injury. The shaft is more easily replaced than other parts. As there is absolutely no machine work on it except squaring the ends, in case of accident a temporary shaft is obtainable anywhere.

Digitized by Google



Type D 1906

4-Cylinder Touring Car

Four cylinders. Air-cooled. Shaft drive. Sliding gear transmission. Three speeds and reverse. New and perfect disc clutch. Force-feed oiler on the dash. 5 passengers. Side doors. 100 inch wheel base. "Franklin horse-power." Full head and tail light equipment. 180 pounds. 40 miles per hour. $2,800.

Details of construction on pages 46, 47, 48 and 49.

The finest and speediest of all 20 horse-power Touring Cars.

Money will not buy more luxury and comfort, or better touring mileage in a car of 4 cylinders or less.

You cannot safely get a better average mileage out of the usual heavy 40-horse-power car than out of this 20 "Franklin horse-power" D.

Its patterns are like the G car but it has larger ders; longer wheel-base, and 8 more "*Franklin* power." It is roomier and even more luxurio appointments. For combined strength, speed, pass capacity, lightness and easy-riding it has no equal, Type H.

FRANKLIN NEWS

co
tin

Clutch and brake levers are put forward out of the way so that the driver can get in and out easily. On the **E** car they are placed inside.

With the **E** transmission the gears are always in mesh. There can be no stripping of gears. When the high clutch is on no gears are used at all, the drive being direct from the engine shaft to the rear axle. The chain-drive has proven so completely successful on the **E** car, that even the opponents of chain-driven cars agree that here it is "all right."

BRAKE CONTROL: Three hand brakes, one on each rear wheel and one on the transmission brake drum. For 1906 these have all been increased in diameter and face until they are now more than amply safe. All brakes are double-acting, and each brake alone is sufficient to hold car under ordinary circumstances.

AXLES: Front axle is made from nickel steel tube. This insures lightness, rigidity and a superabundance of strength. Yokes and knuckles are of nickel steel. Bearings are of Timken make, especially designed for *Franklin* cars.

Rear axle on **TYPES G, D and H,** divided driving axle running in tubular axle on ball-bearings. On **TYPE E,** divided driving axle running in tubular axle on Hyatt roller bearings.

Rear axle is of nickel steel, especially treated, and of from 58 to 64 tons tensile strength per square inch. Differential gears are in an oil-tight case. Differential and bevel drive gears are made from nickel steel forgings.

NICKEL STEEL: This material is specially adapted for automobile construction and will be used the coming season throughout *Franklin* cars. Our transmission gears and shafts, drive-shafts, differential in rear axle, bevel driving-pinions, clutch-shaft, brake rods, rear and front axles, knuckles and yokes are made from this material. It was only with great difficulty that we could secure this stock in forgings. Drop forge manufacturers dislike to handle this material, as it is very tough, slow to forge and extremely hard on dies. It can only be machined by using powerful machines and high-speed steel tools. As the stock is hard to get, we were obliged to order early in the spring and in the quantity wanted for a season's supply. This is new in our hands. Customers are assured of the best stock obtainable. Manufacturers who have ordered late cannot entertain much hope of getting this stock in time for early 1906 deliveries. We specially desired this stock, as it possesses maximum strength and minimum weight. It is only a little way removed from armor-plate.

STEERING GEAR: Irreversible wheel.

SPRINGS: Four full elliptic springs. On Type **E** 30-inch, **D** and **H** 40-inch. These springs take up all road shocks—horizontal, vertical and from every direction—more completely than can be done by any other means, thus saving passengers and car.

SILLS: Our sills are of specially selected second growth ash seasoned one year. Our buyer personally inspects every stick of timber which is purchased for *Franklin* sills.

Wood sills are admitted to be a distinctly *Franklin* feature. When mounted on four full elliptic springs these sills give a combination for easy riding which is equaled by no other cars in the world.

WHEELS: Wood—artillery type. and **G** 28-inch; **D,** 32-inch; **H,** 34-inc

TIRES: On Type **E,** 28x3; **G,** 760x9 760x90 rear; **D,** 32x3½; **H,** 34x4.

TANK CAPACITY: In **TYPES E** 7 gallons gasoline; 6 pints lubrica enough for 125 miles. In **TYPE D,** 1 gasoline; 6 pints lubricating oil, en 150 miles. TYPE H, 16 gallons, en 20 per cent.

TREAD: Standard.

BODY: In **TYPES G, D and H,** al with two side doors, divided front se gle seat for three behind. In **TYPE** inum, built on steel angles; divid Special soft cushions.

Aluminum is both stronger an than wood. Will not crack nor spli holds finish better.

Side-doors open towards front; sion hinges, swinging clear open a wide entrance.

HOOD: Aluminum, and instantly able.

FRONT MUD-GUARDS: Impro tern, giving complete protection fro

MUFFLER: Small but entirely e

BOOT: A strong, light steel boo the motor from dirt and water. designed that it will not accumula gasoline, thus protecting the car fr by fire. A very important considera

EQUIPMENT: Two oil side lam lamp, 2 headlights, horn, complete t ment. Best quality lamp, and on H acetylene mirror-lens headlights

Type H 1906

6-Cylinder Touring Car.

Six cylinders. Air-cooled. Shaft drive. 3-speed sliding gear transmission. New and perfect disc clutch. Wheel base 114 inches. 30 "Franklin horse-power." 2,400 pounds. 50 miles per hour. Full head and tail light equipment. $4,000. Complete specifications on pages 46, 47, 48 and 49.

This car combines great power with light weight to a degree never before attained. It is the *Franklin* idea pushed up to the highest notch.

For speed it is the "Empire State Express" or "20th Century Limited" of automobiling.

The six cylinders have the same advantage for a very high-power car that four cylinders have over any smaller number in a car of moderate power.

The engine force is divided into six impulses; which balance the motor rotation with extreme evenness and produce the utmost smoothness of running and flexibility of operation.

They also permit tremendous power and speed without a corresponding increase of weight or strain on the car.

Type H is the *Franklin* of all the *Franklins*.

Service. Economy. Value.

All *Franklin* Cars can be used right through the winter. No weather can freeze them. With air-cooling there's nothing to freeze.

They call for no plumbing work at any season; no expert "chauffeuring;" no warm barn.

They give continuous all-the-year-round service; and when topped are perfectly comfortable in any weather.

They are the strongest cars of their weight ever built; and the lightest cars of their power.

They cost 50 per cent more per pound to build than any other cars.

Refined engineering and simple design make them efficient far beyond proportion to their ratings; and this efficiency is all available; on all roads, all the time.

Their great strength, responsiveness to control, lightness and perfect spring-suspension make them safe and comfortable when driven at speed on roads which would be neither safe nor comfortable at such speed for any other cars.

No matter how fast a heavy car can go on level boulevards, it cannot safely—much less comfortably—be driven at speed over average American roads. Neither the car nor the passengers will stand it.

The high-power *Franklins* cool as completely and perfectly as the runabout, in hot weather or at a hot pace. This is a demonstrated fact, beyond shadow of doubt. The proofs fill a book; if you want it we'll send you the book.

All *Franklin* cars are remarkably quiet.

Franklin touring-cars do the same work as the heaviest highest-priced cars; but are far easier to ride in, to handle and to care for; far more enjoyable, safer and vastly more economical.

Heavy cars are costly to buy, to operate and to maintain. They are frightfully expensive in their wear-and-tear on tires.

Franklins save fuel, oil, repairs and above all, tires.

Franklins give you more of all the things you want and also save your money.

They are sold under a strong and definite guarantee.

The *Franklins* shown here are not only up-to-the-minute cars of the season; but their far advanced design and detail perfection will make them favorite and standard cars of many seasons. Not one-year cars; but cars "for keeps."

CHRISTMAS DIAMONDS ON CREDIT

THE LOFTIS SYSTEM AT CHRISTMAS TIME

is a great and timely convenience to thousands. It enables persons in all circumstances to make beautiful and appropriate **Christmas Gifts** with a very small initial cash outlay.

Everyone at Christmas time is anxious to give to their loved ones handsome Christmas Presents but it is not always convenient. The **Loftis System of Credit, means convenience.** Diamonds, Watches and Handsome Jewelry of all kinds for Christmas Presents on convenient terms.

You Are Welcome to Credit whether you are a moderate salaried employee or a wealthy employer. The Loftis System makes any honest person's credit good by adjusting terms to meet their earnings or income. Do not think that you must give a cheap, ordinary present because you can only spare a few dollars just now. With five or ten dollars for a first payment you can give Wife, Sweetheart or Mother a beautiful Diamond which will last forever, enhance in value and continually bring pleasant thoughts of the giver's generosity.

Love is the Real Santa Claus. It is love which brings the joys of a Christmas remembrance and a Diamond is the most appropriate of all gifts for a wife, sweetheart, sister or mother because it is the true token of love. **It is the gift of gifts. Write today for our Big Handsome Christmas Catalogue.**

Our Christmas Catalogue for this year will be the largest and most complete we have ever issued. **Write for a copy today** and glance through the wealth of Gems, Fine Watches and miscellaneous Jewelry illustrated on its many pages. Beautiful Xmas presents for all. Diamond Rings, Brooches and Pins for Wife, Sweetheart, Sister or Mother. Diamond Studs, Scarf Pins, Fine Watches, Charms, etc. for Husband, Father, Lover or Brother

At your leisure in the privacy of your home you can select the Diamond, Watch or piece of Jewelry you prefer. Write us and we will send you any article you may select subject to examination and approval. Examine it thoroughly. You are perfectly free to purchase or not just as you please. We pay all charges. We take all risks. We deliver goods anywhere in the United States.

We invite you to open an account with us, become acquainted with the famous **Loftis System.** Remember it means **convenience.** Every transaction is on honor, prompt and satisfactory, one fifth the price to be paid on delivery. You retain the article, sending balance in eight equal monthly amounts direct to us.

Cash Buyers are welcome too, and we have an equally attractive offer for them, as follows: Pay cash for any Diamond, and we will give you a written agreement to take it back at any time within one year, and give you spot cash for all you paid—less ten per cent. You might for instance, wear a fifty dollar Diamond for a year, then send it back to us and get forty-five dollars, making the cost of wearing the Diamond for the entire year, less than ten cents weekly. No other house makes this offer. **Write today for Christmas Catalogue.**

Diamonds As An Investment are unexcelled. They are increasing in value every year. The Chicago Journal says in an editorial that they will advance twenty per cent in value during the coming twelve months. What other present is there so acceptable and so profitable? **Write today for Christmas Catalogue.**

The Gold Medal Highest Award won by us at the World's Fair, St. Louis.

Do Your Christmas Shopping Now. Do it conveniently and leisurely in the privacy of your own home. Don't wait until the Christmas rush is on. **Now** is the time to secure the choice selections and have ample time to inspect the goods. **Write Today for our Big Handsome Christmas Catalogue.**

A Test of Merit. In competition with the entire world at the St. Louis World's Fair last year our goods, prices, terms and methods won the **Gold Medal**, the highest award given to any exhibitor. No stronger endorsement of the **Loftis System** could be given. **Write Today for our Big Handsome Christmas Catalogue.**

Our Reliability. We refer you to your local bank, and they will consult their commercial guides and Bradstreet and tell you that our responsibility and promptness are unquestioned. We give a signed guarantee as to the quality and value of every Diamond sold. Every Diamond we sell may be exchanged at full price at any time for a larger stone.

WRITE TODAY FOR OUR CHRISTMAS CATALOGUE.

ANNOUNCEMENT

The 1906 Rainier

30-35 H. P.

has arrived. Come and inspect, ye automobile experts—you who really appreciate beautiful workmanship and design, and you will admit that at last THE American automobile has come. Look over the following specifications, then call and try the car:

Engine—30-35 H.P., 4-cylinder, water-cooled.
Ignition—Sims-Bosch Magneto. Make and break spark.
Transmission—Sliding train, 3 forward and one reverse.
Rear Axle—Bevel gear drive, clutch driven hub, ball bearings.
Front Axle—I beam section, ball bearings.
Frame—Cold rolled pressed steel, aluminum under-bonnet covering entire engine and transmission.
Wheel Base—104 inches.
Wheels—Imperial whalebone, grade A; 2d growth hickory.
Tires—Continental, 34x4.
Valves—Mechanically operated, inlet and exhaust interchangeable.
Carbureter—Float feed, requiring no adjustment.
Body—Full aluminum, double side entrance.
Brakes—Two internal expansion, dust protected, operating on rear hubs through emergency lever holding either forward or backward. Foot brake operates on propeller shaft. Both brakes phosphor bronze against steel.
Equipment—Two headlights, 2 side lights, 1 rear light, 1 horn.

Price, $4,000

The 22-28 h. p., which was the hit of the season in New York, will be continued as heretofore without any changes. 4-cylinder, 98-inch wheel base, La Coste coil, French battery, Continental tires, aluminum side door body.

Price, $3,500

Both models guaranteed free of repairs for one year. The world's broadest and most liberal automobile guarantee.

Landaulet bodies for immediate delivery. Limousines for October and November delivery.

DON'T EXPERIMENT

Just Sell

THE FORD

MR. AGENT:—Over 2,000 Automobile buyers decided during the past season not to experiment. They all bought "Fords." It is even more important for the retailer to *sell* a car of known merit than it is for the purchaser to *buy* one. The buyer only loses his *money*, but the Agent who sells a car not up to standard loses both *prestige* and *reputation*.

The success of the Ford Motor Co. is built on the success of the Ford Cars, and you know how great our success has been. Remember that people like to do business with successful firms, and a *car with a reputation is easier to sell than an unknown*.

You know the general rush to the Ford exhibit at the shows and how they all ask *"What has Ford this year?,"* plainly indicating that automobile men look to Henry Ford for new ideas and originality of design.

We have a surprise or two up our sleeve this year—particulars about October 15th—nothing before—except that there is certainly good business ahead for the Ford agent in 1906, and it might be well to write us and see if we can give you the proposition and the territory you require.

FORD MOTOR CO., Member American Motor Car Manufacturers' Association, Chicago **Detroit, Mich.**

The Hartford Perfected Dunlop Tire

Paris, July 28, '05.

Dear Sirs:-

We have arrived in Paris coming over the Route Nationale from Aix les Bains via Lyons and Nevers. The roads were exceedingly trying, very hard and a lot of "pave" or cobblestones. I had two punctures. These were the only mishaps in 2136 miles and the tires have stood the hard work without showing any other signs of wear and tear. People here consider this a very good record as many of the best foreign tires blow out from the heat.

Yours truly,

Walter Hale

Postal No. 3.

This AUTO TIRE has no BAD HABITS

It won't creep—it won't rim-cut—it won't come off the rim when run deflated no tire bolts required to hold it on the rim—and you can take it off and put it back in 60 seconds, using nothing but the hands. And it's a Tire, besides, that's as resilient as a "soft" tire, and will outwear most "hard" tires.

Sounds like a fish story, doesn't it?

But it's a *fact*, nevertheless.

Barney Oldfield didn't believe it, either, but he does now.

We *showed* him—he saw with his own eyes—and now he uses the Goodyear Detachable Auto Tire with the Universal Rim in all his races.

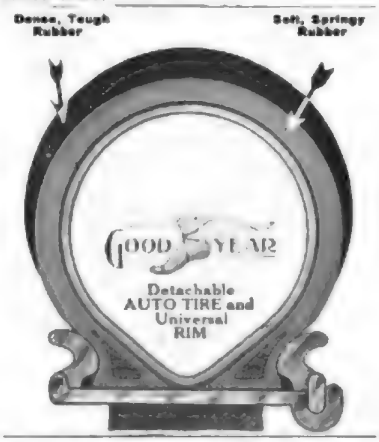
He used this tire at the Boston meet on Sept. 9th, where he made five miles in 4:55 and a mile in :55 1-5—breaking the track record.

You ought to hear Barney's chaffeur sound the praises of the Goodyear Detachable to all who will listen to him—hear him tell how reliable it is—how it saves him time, trouble and worry and makes his position easy. He says he never thought it possible (before using the Goodyear) to embody all the good points a tire *ought* to have in one single tire.

We wish you could come with us to the factory or to one of our branch stores. Then you could see in no time for yourself just why and how these things are true. You can "see through" it all instantly when the tire is before you.

We'll try, however, to explain just *one point*, here.

Why the Goodyear Detachable Auto Tire is *Durable* and *Resilient* at the same time.



Look at the section of the Goodyear Tire in the center column. Notice the crescent shaped portion is solid black where the wear of the road comes. That's dense, firm rubber, as tough as rawhide—practically no wear out to it.

Now right underneath this is the remainder of the outer casing (shown in grey) which is made from pure para rubber, as resilient and springy as it is possible for rubber to be.

These two different kinds of rubber—the dense, tough composition, to take the wear, and the soft, elastic rubber, to make you ride easy—are made into one solid piece by a special process. You can't skin the two kinds of rubber apart with a knife. Try it if you doubt.

The soft rubber portion is strengthened by having our *special fabric* vulcanized into it. This fabric is not the hard, inflexible sail cloth used in ordinary tires, but is woven like basket work, or an open-work stocking, and *gives* back and forth under pressure, and allows the elasticity of the rubber full play.

The dense rubber, the soft rubber and the special fabric together make a tire that's almost as durable as a *solid* tire, a tire difficult to puncture yet one which is as *resilient* as a man could reasonably ask.

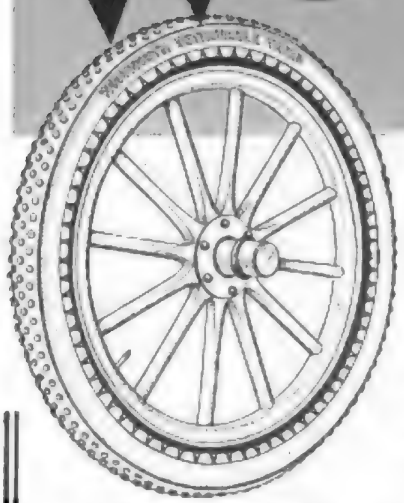
Our "Good News Book" tells more about the good points of this trouble-saving tire. You ought to get it now, for the Goodyear Detachable Auto Tire with Universal Rim will be "the only tire" next season.

THE GOODYEAR TIRE & RUBBER COMPANY, Wallace Street, AKron, Ohio.

Branches in following cities: Boston, 6 Merrimac St.; New York, 253 West 47th St.; Chicago, 110 Lake St.; Cincinnati, 242 East Fifth St.; St. Louis, 1219 N. Broadway; Cleveland, 60 Frankfort St.; Philadelphia, 1421 Spring St.; Denver, 220 Sixteenth St., and Detroit, 247 Jefferson Ave.

WOODWORTH DETACHABLE TREAD

FOR AUTOMOBILE TIRES



Is the proper equipment for fall and winter use. It prevents slipping and skidding on muddy or icy streets. It also protects the tires from hard, frozen roads. The treads can be put on without removing the tires from the wheels. They are held rigidly on the tires by side-wires which pass through the loops and are tightened by small nuts. No special tools or equipment are required to apply them—with a wrench and a pair of pliers anyone of ordinary ability can do the work.

Can be used on any pneumatic tire, no matter how badly worn, if it is strong enough to stand the air pressure.

You will need something for use for this fall and winter. Why not get the best thing there is? They are not exorbitant in price.

Business and the Oldsmobile

As a business man, when you decide to buy an automobile, you naturally turn to the trim, ever ready runabout, whose popularity among business men has won it the title of "An Office on Wheels."

It has been found that for daily use about town or even for runs into the country, the standard runabout, with its 7 h. p. single cylinder motor, is the most economical to operate and gives the most efficient service.

Traveling men have adopted it both for city service and, in a number of instances, for covering territory made up of small towns in well settled sections. For example, in Southern Michigan and Northern Ohio one man has used an Oldsmobile runabout for the past three seasons in visiting 225 towns, driving in so doing 8,000 miles each season.

Others have had equally satisfactory experience.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

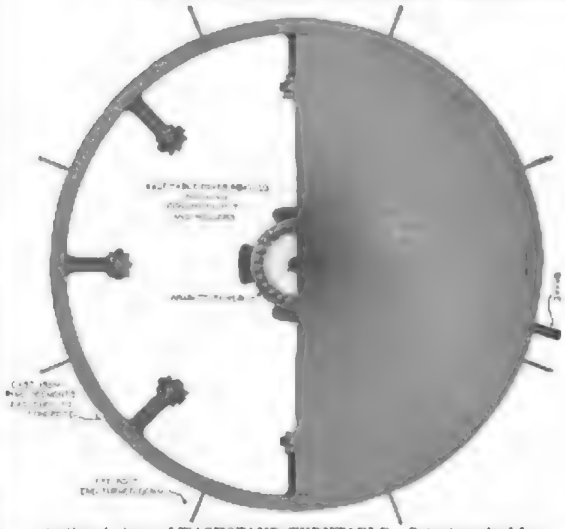
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

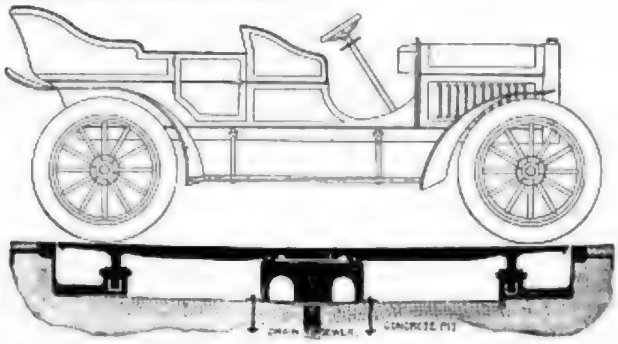
It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.





Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

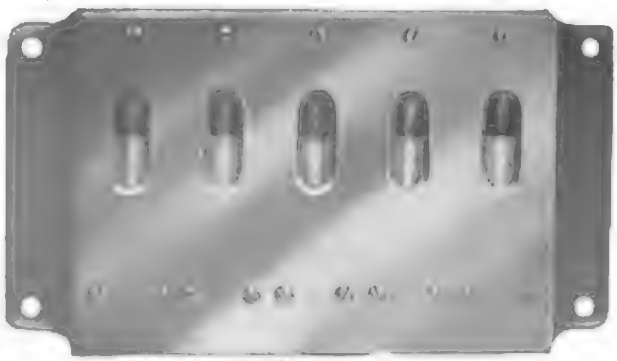
VALVELESS WONDER

A pump without valves, stuffing boxes or springs. When we eliminate these unnecessary va ves, stuffing boxes and springs we eliminate all of your trouble. Our pumps are all tested before being shipped to 1400 lbs. pressure. Are manufactured in any number of feeds.



Patent Applied for

We herewith illustrate a sight feed for the dash, which will not cloud and which allows the full pressure of the pump to be exerted through it. With this type of sight feed it enables you to keep the dash on your auto clean. You can place the pump down under the body of your machine, piping to the sight feed and from sight feed to the engine or bearing you wish to oil. These are manufactured in any number, indicating the feed of the oil by the movement of the metal discs inside of the glass.

Will you write us about the

1906 Agency for the Wayne?

The Wayne Agency for 1906 is a good thing. The Wayne Cars were extensively advertised last year in all the leading magazines and trade papers. For 1906 we have made arrangements for a campaign of cooperation with our local agents which will mean practical assistance in selling Wayne Cars. We realize that to get good agents it is necessary for the agent to have a proposition on which he can make money, and the Wayne agency proposition is one which it will pay you to investigate.

The Wayne line for 1906 is comprised of cars that have proved their ability to stand hard usage by three years' road service.

We have not changed the Wayne principle of construction because nobody has yet been able to show us anything better tho' our cars contain all new improvements and are strictly up-to-date (no old models built over).

WRITE US AND FIND OUT WHAT WE HAVE TO OFFER, BEFORE YOU FORGET

WAYNE AUTOMOBILE CO. - Detroit, Mich.

G&J TIRES

The Strongest Tires Made—because only the best of materials are used in their construction.

The Most Comfortable Tires—because most resilient.

The Most Economical Tires—because, being resilient, they increase the power of the engine, and reduce the consumption of fuel.

The Easiest Tires to Handle—because no tire clamps are used.

SEARCHLIGHT SWINDLERS

The success of the Rushmore Lens Mirror Searchlight has been so complete that as a matter of course the lantern makers have been compelled to either try to imitate it or go out of business.

A number of them have conspired to keep us out of the automobile shows, have claimed that we do not make the celebrated Rushmore Lens Mirror and that they get their cheap flat lenses from the same place, and have resorted to every contemptible trick to deceive people into buying their trash.

Certain so-called jobbers have tried to push the sale of the imitation lights by issuing lists of what are insinuated to be our prices in comparison with their alleged cheap prices. The statement that we ask the prices quoted is a deliberate and malicious lie. The prices they offer are but a few cents lower than ours, while the fake lights they offer are by comparison not worth their weight as junk.

Some of the fake jobbers refuse to furnish the Rushmore light when requested to do so on the plea that we cannot make delivery. That statement is likewise a deliberate lie. They offer to refund your money if not as represented, but you had better hold on to your cash.

We do not ask any money in advance, but will send the Searchlight on ten days' free trial to anyone worthy of credit. The fake jobber can make but 25 per cent to 30 per cent on the Rushmore, while he clears 100 per cent to 200 per cent on the fake lights which he obtains on consignment. Do you wonder that he is willing to cheat you?

Our prices are the lowest for the quality and we ship from stock.

RUSHMORE DYNAMO WORKS, = Plainfield, N. J.

"Firestone"

It Takes Knowledge

Born of experience to manufacture a tire that will continue to stand the strain of use on commercial vehicles.

In many instances trouble with tires has made a commercial vehicle unprofitable until FIRESTONE Side Wire TIRES were adopted.

We have in our offices EVIDENCE of what FIRESTONE Tires have done, after many others have been tried and found deficient.

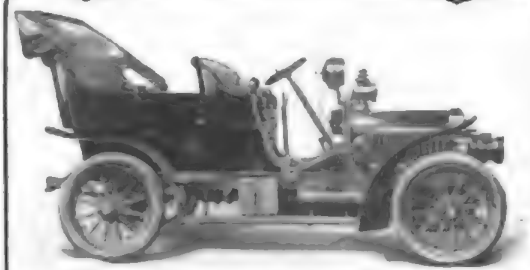
THE CAR OF SIMPLICITY



A Reliable Brake

is very important on an Automobile at all times: whether ascending or descending grades or running on the level.

¶ The Brakes on the CLEVELAND CAR—three—are positive in their action, and can be relied upon to perform their duty in any emergency. Any one of the three Brakes on the CLEVELAND when applied, disengages the clutch.

¶ The Emergency Brake is operated by a lever at the rights of the driver, and consists of one double-acting internal expanding bronze shoe, mounted in each of the rear hub drums.

¶ This Brake is so effective when applied, that it is possible to stop the car almost instantly.

¶ If you will send for our new Catalog, which contains full descriptive matter and illustrations, it will tell you more than the limits of an advertisement will permit.

HILL PRECISION OILERS

THE WINTON MOTOR CARRIAGE CO.
MANUFACTURERS OF WINTON MOTOR CARS.
CLEVELAND, OHIO, U. S. A.

Sept. 14, 1905.

The Steel Ball Company,

840 Austin Avenue,

Chicago, Ill.

Gentlemen:

In reply to your favor of the 12th inst., would say that Mr. Alexander Winton has always recognized lubrication as one of the most important problems to be solved by automobile builders.

It is safe to assume that the Winton Motor Carriage Company has devoted more thought and experimenting to this feature than any other automobile manufacturing company in the country.

For more than a year the Hill Precision Oiler has been subjected by Mr. Winton to the most exhaustive tests, both in our experimental department and also in exceedingly severe and prolonged road work. The most satisfactory results have been obtained, and as a result, believing it to be the most perfectly developed lubricating device yet produced, Winton cars will be equipped during the coming season with the Hill Precision Oiler.

Yours very truly,

THE WINTON MOTOR CARRIAGE CO.

General Sales Manager.

THE STEEL BALL COMPANY

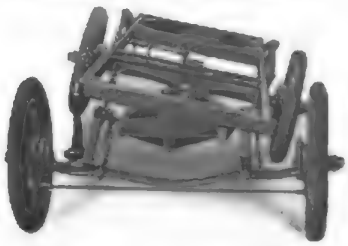
THE MARMON

"A Mechanical Masterpiece"



Twisting an Automobile

Get the details of this front view firmly in mind. Note that raising a rear wheel over a foot tilts the body frame, but does not tilt the lower frame. (A front wheel raised reverses the condition.) Note that one wheel rests on the obstacle encountered but that the other wheels rest solidly on the ground doing their full duty, adjusting themselves naturally to any position the road may demand.

All country roads twist an automobile in this way—in small or large degree. The flexibility of the Marmon is such that it endures this constant process of twisting *without straining* any part.

But substitute any other car in this test, bearing in mind that other cars have but one frame, attached to the four springs. Suppose you fastened the same three wheels to the ground (they would have to be well fastened) and applied enough force to raise the other wheel a foot. You would get somewhat the same effect by securely nailing three legs of your chair to the floor and trying to lift the remaining leg. Not quite so bad as that because the car has springs, but springs do not remedy faulty principle, and strain through every part is the certain result.

Then multiply this strain by the effect of speed over rough roads that present constantly varying conditions for twisting the mechanism.

That done, you will be partially aware of the importance of an exclusive *patented* Marmon feature.

Double Three-Point Suspension

Solid cast aluminum body on one frame, power plant on another frame, *each frame* suspended on three *pivotal* points. No matter what wheels are raised, no matter which frame is tilted, the power plant and rear axle are maintained in perfect alignment. Permits the use of a rigid shaft drive (*without universal joints*) delivering a greater percentage of power to the wheels than is had in any other car.

This elasticity, by eliminating the binding and twisting strains inevitable in the rigid suspension of all other cars, means simpler parts, fewer parts and less wear on all parts, tires included.

It also gives the Marmon, over all roads, an easy gentle sway, a luxury of motion that is unknown and unknowable in *any other car*.

Stylish, strikingly handsome, and very quiet. Four cylinders; air-cooled. Has the only perfect force lubrication system, and is replete with features that appeal instantly and forcefully to all who seek a strictly high-grade car.

Write for Booklet No. 1 and become posted on the finest car of the times.

Diamond

Wrapped Tread Tires

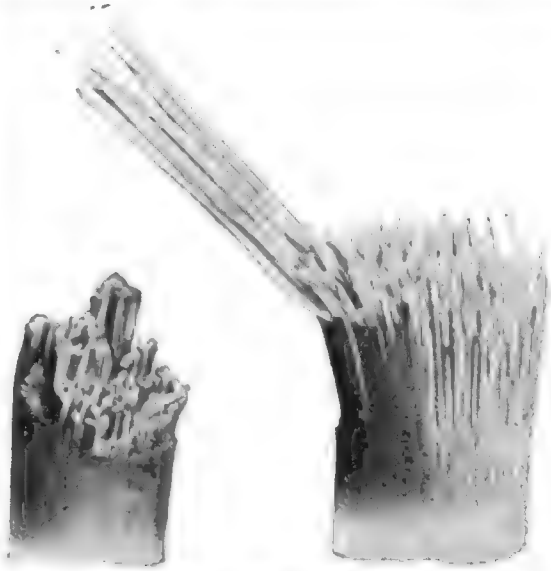
Loss of Time because of Tire Trouble counts as much in such a contest as Loss of Time because of Engine Trouble.

Manufacturers of cars do not select Tires on such occasions from sentimental motives.

They KNOW.

The Diamond Rubber Co.

Akron, Ohio



The "short" fracture shown above, while characteristic of poor oak, happens to show the fracture of poor hickory. The other fracture shows the quality of "Imperial" spokes.

Talks on Wheel Making No. 4

A bursted tire is robbed of its danger if the car is equipped with Imperial wheels.

There are two common methods of assembling wheels. One is to assemble the spokes in the two halves of the felloe, and then join the two halves. This method affords no guarantee of equilibrium of the central spoke arch, as only two of the spokes have a final radial pressure, while at least two have no radial pressure whatever. The other method is to press the spokes radially into the arch and assemble the felloe upon the spokes, afterward springing the spokes into the holes of the felloe. The shorter the spokes the greater the disturbance to the arch.

We employ neither method. In our factory spokes are assembled on the half rims without springing, but the final pressure on the spokes is radial in other directions, and the arch is undisturbed after assembly. We lubricate the arch that the spokes may "come home" evenly. The lubricant serves as a binder to protect the finished wheel and arch against those local strains which so often throw a wheel out of line.

The excellence of Imperial wheels is based upon the perfection and refinement of orthodox methods.

THE AUTO-METER

on a car tells the speed of travel and the distance traveled. It is absolutely accurate.

"Built Like a Chronometer."

When you are whirling along, a glance at the Auto-Meter before you, tells you **exactly** how fast you are going if your pace be as slow as a fraction of a mile or as fast as 60 miles an hour.
When a trip is finished, the Auto Meter tells **exactly** how many miles you have gone on that trip.
When the season is over the Auto-Meter tells **exactly** how many miles you have covered during the season.
All this is worth while. Is it not?
Get acquainted with the Auto-Meter. It will lead to lasting friendship.
Write for catalogue and pamphlet, "Indisputable Evidence." The latter gives the interesting experiences of many prominent automobile owners.

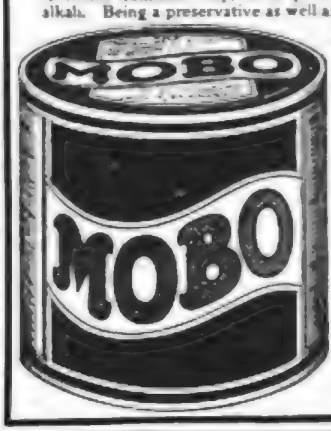
The Care *of the* Car

Washing the body of the machine, keeping the polished surface free from lubricator, road dust and gutter muck is just as essential to the life of an Automobile, as is the attention given the running gear.

Mobo, the new cleanser for Automobiles, will easily and quickly remove grease, dirt and grime and all traces of a hard run, without dulling or scratching the highly polished surface.

MOBO

is unlike common soap, as it positively contains no free alkali. Being a preservative as well as a cleanser, it prevents varnish or paint from peeling or cracking, and adds a fine gloss to the surface.



Mobo may be used with profit on leather goods, harness or woolen fabrics. Cannot harm the most sensitive skin, as it is a purely vegetable oil preparation and absolutely contains no free alkali. Put up in 2-lb. and 8-lb. cans; also in tubs, half barrels and barrels.

If your supply man does not keep *Mobo*, send us his name and address, and we will see your wants are supplied.

JOHN T. STANLEY

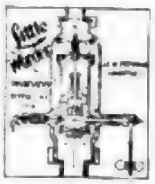
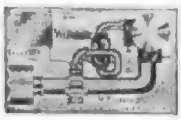
PATENTS PENDING IN ALL COUNTRIES

The Little Wonder Carburetor Manufacturing Company

347 Franklin Street
BUFFALO, N. Y.





This carburetor will fit all classes of motors, from one-horse power up, and is especially adapted to automobile and marine engines.

The "Little Wonder" Carburetor, used in connection with our Hot Air Generator on the exhaust pipe, is guaranteed to increase your horsepower from ten to twenty per cent, economizing in fuel consumption, giving a perfect mixture in quantity and quality at all engine speeds; it is 100 per cent safer than the float-feed carburetor, and is positively guaranteed not to ignite or explode, and is absolutely impervious to flame or back-firing.

The "Little Wonder" Carburetor is hot-air jacketed, as enclosed cut shows, thereby increasing the vaporization of the gasoline, and giving a hot gas mixture under all atmospheric conditions. Our Carburetor will not leak, freeze, flood or cause any trouble, as is the case with other carburetors now on the market. Our object in placing this carburetor on the market has been to supply the increasing demand for an entirely automatic, simple, reliable and absolutely fireproof form of carbureting device. That we have succeeded in our efforts has been thoroughly proved by the appreciation of the many users and advocates of the pump-feed type of carburetor. In the "Little Wonder" Carburetor the air as well as the gasoline can be regulated at will by the operator. Our Carburetor is so simple that anyone of ordinary mechanical ability may perfectly adjust and apply same to motor.

Prices quoted upon application.

Generator, listed $10.00 **Carburetor, listed $15.00**

Ask for quotation and give diameter of exhaust pipe, 1½" up.
We build Gas Engines and Steam Engines; also Racing Machines for roadway and waterway, all combined in one. See cuts.
Ask for prices on our Wheel Crank for pulling off and on wheels.

Respectfully yours,

J. C. W. FERRAR, General Manager and Owner.

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the two cycle two cylinder Elmore engine. Understand—the two cycle two cylinder Elmore engine produces two impulses every time the flywheel turns. As you know, the two cylinder four cycle furnishes only one impulse every fourth time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

BRISCOE MFG CO.

OLDEST AND LARGEST MAKERS
OF
AUTOMOBILE RADIATORS

DURING the past season we sold 12,945 radiators to 54 bona fide motor car manufacturers among whom are nearly all of those who have produced high-grade and successful cars.

Over 30,000 of our radiators are now cooling automobile engines.

Our standard honey comb radiators are of true cellular construction, allowing cross circulation and accounting for their high-cooling efficiency per pound of weight of cooler.

The hit of the year 1905 in radiator design has been our flat tube construction with gang fins. We make special designs for every class of car from the light runabout to the heaviest truck or omnibus.

The finish on Briscoe fenders is unexcelled. 1906 styles on metal dashes, hoods and runabout boxes are prepared and we are daily booking contracts for next season's business.

COOLERS FENDERS

HOODS TANKS

By dealing with us you get the benefit of our long experience and the protection of the many patents we own, covering our methods of construction.

The Pierce Great Arrow car which won the Glidden trophy was equipped with a Briscoe radiator. Of the twelve American water-cooled gasoline cars which received first certificates at the end of the tour six of the radiators were made in our shops, four were made by the car builders, and only two were made by other radiator manufacturers. These facts are typical of our prestige.

Our two large plants are ready to take care of our rapidly increasing business. We cannot only promise but make deliveries.

Write to our nearest office for estimates and get in line for 1906.

A New Era in Carbureters

THE GARLLUS AUTOMATIC CARBURETER is a perfectly automatic carbureter, without a float, without compensater, easy to start, sure to run. So simple it cannot get out of order. Greatest economy. Highest efficiency. An easy starter on four cylinder engines. Money refunded if not satisfactory.

The Goddard Machine Co., Holyoke, Mass. says: "The GARLLUS CARBURETER gives a 10 per cent higher efficiency than any carburetor we have tried, producing in a test two h. p. more than the ..... and one h. p. more than the..... We believe in it thoroughly." (These were two prominent float feed carbureters.

The Persuasive Instrument

¶ The average person who drives a motor car has a desire to speed—to "let 'er out."

¶ But we have yet to find the man who has an insane desire to get within the clutches of the law.

¶ *The Jones Speedometer* has that peculiar influence over the speeding motorist—if he is beyond the limit—there is that "arrow"—a constant reminder. It persuades him to go slower. Thus it accomplishes a great service.

¶ And to each user of The Jones Speedometer we present our brass Protection Tag which warns the officer of the law, not to arrest on guess work.

JONES SPEEDOMETER

J. T. PEDERSEN, 642-644 First Ave., N. Y.

Colorado
At Her Best

In late summer Colorado is at her best. The green of the verdure on mountain and meadow is slowly turning to crimson and gold. Afar looms a peak whose snow-capped summit is enshrouded in autumnal haze. The air is laden with the spice of mountain pines and fir trees.

Colorado is surely the best place to go for the autumn vacation.

Very low rates via the Rock Island—Standard and Tourist sleepers and electric-lighted chair cars.

Go via Chicago, return via St. Louis if you like.

Use this coupon to learn all about it.

HEMERY CAPTURES VANDERBILT CUP

Lancia Does Remarkable Driving and Loses Race Only By Slight Accident – America's Good Showing

HEMERY

HEATH

1—A. Hemery in Darracq. Time: 4:36:08

2—Geo. Heath in Panhard. Time: 4:39:40

3 Joseph Tracy in Locomobile. Time: 4:58:26

4—V. Lancia, in a Fiat. Time: 5:00:31

SCENE AT THE START, WITH LANCIA READY TO LEAVE

NEW YORK, Oct. 14—La Belle France won the Vanderbilt cup. Uncle Sam was second, and what do you think of that! Classic Italy, with victory within her grasp, fell by the wayside, a victim to one of those strokes of ill-furtune that seem inseparable from the gamble of these contests, but pluckily persevered and finished third. The Vaterland was fourth and a bad fourth at that, let it be understood.

The American cup of automobiling will remain in France another year. In probably the all-around fastest and most fiercely fought fight of the whole series of international motor car road races, Hemery and the Darracq evolved today as the winner of the trophy young W. K. Vanderbilt put up for the first time last year for the encouragement of the American sport and industry.

JOSEPH TRACY

Great as was the driving of Hemery and Heath, and speedy and reliable as the Darracq and the Panhard proved, France's victory was not as clean cut nor was her road racing supremacy so indisputably proved as it was for the time being, when her riders finished first and second in the Vanderbilt and Bennett contests of last year and in the race over the Auvergne circuit in July.

There is a might-have-been to cloud the brilliancy of France's achievement, with an element of good luck that came from the ill luck of an opponent, who was showing her and her cars a clean pair of heels and seemed likely to prove a runaway winner, until an unlucky collision put the best driver and the fastest automobile out of the race, at least for first place.

Lancia, of the Italian team, who had led Heath, of the French quintet by 11 minutes 7 seconds at the close of the seventh lap, just as he had led Thery, the Bennett winner, in this year's contest, when an unlucky collision with Christie befel him and robbed him of all chance of

HEMERY EXPRESSES COMPLETE SATISFACTION BY HAND AND MOUTH AT OUTCOME OF THE RACE

first place. Up to the fatal eighth lap the Fiat driver had covered 198.1 miles at a rate of 70 miles an hour and gave an exhibition of long distance speeding, the like of which we Americans never before saw at home and Europeans had been only once before shown abroad; that, too, by the same Italian. But these collisions and the avoidance thereof are a part of the racing game, so it would be unfair to call France's victory mere luck. Justice and history, however, demand a mention of the incident and a qualification of the winner's triumph.

The victory of France, Hemery and the Darracq recorded, let us get quickly to cold facts and summarize the results. The finish in order was France, America, Italy, Germany. The Fatherland was a bad last. She was not numbered among those who completed the race and captured the first four places.

Heath, an American, of Parisian residence, last year's Vanderbilt winner, was runner up. Joe Tracy, who tried for the Bennett and failed and rode in the American trials and succeeded, was third. Lancia, despite his accident, finished the 10 laps and captured fourth.

In laps completed, an important factor of this sort of racing, in which even survivorship is an honor, France also led with 39 and an average of 7⅘. At this sort of reckoning Italy was second, with 35 and an average of 7. Uncle Sam scored 26 with an average of 5⅕, Germany's four-fifths of a full team bringing up the rear with a total of 17 and an average of 4⅘.

Hemery's average was 61.53 miles to the hour and 58.5 minutes to the mile; Heath's, 60.70 miles and 59.3 minutes; Tracy's, 57.07 miles and 57.07 minutes, and Lancia's, inclusive of his delay by his accident, was 56.7 miles and 63.7 minutes.

By way of comparison with the other great road races of the year, it is to be noted that Raggio won the Florio cup with an average of 64.8 miles; Hemery, the Ardennes circuit, 62.34; Dingley, the American trial, 56.22, and Thery, the Bennett, 47.63. Heath's average last year was 52.4 miles.

The fastest laps scored by the teams were: Lancia, Italian, 23.18; Sisz, French, 24.16; Jenatzy, German, 24.23; Tracy, American, 27.40. The fastest lap in last year's contest was 24.04, scored by Tarte, of the French team.

Immediately following the race, a protest and counter protest, both in writing, were submitted to Referee Vanderbilt and Chairman Morrell. The initial one was made by a representative of the Panhard against Hemery's Darracq. The claim was that it was shod with tires which were made in England, French Dunlops being the tubes in question. The Darracq representative, Mr. Rawlinson, was evidently prepared for such a protest, for he was abundantly supplied with affidavits, setting forth that the Dunlop company had recently established a factory in France and that the tires used by Hemery were made there.

Following the presentation of these affidavits Mr. Rawlinson protested Heath's Panhard, on the ground that its magneto was made in Germany. Later better counsels prevailed and both protests were withdrawn, leaving Hemery's title to the cup clear.

In the success of the Locomobile as a racing car, A. L. Riker as a designer and Joe Tracy as a driver, America won a triumph. To be candid, it was unexpected. With America's ill-luck in her previous efforts at international racing and the din of the beating of the European tom-toms that marked the fortnight before the race Uncle Sam had been forced into the background in auto race calculations. Few had the courage to hint at possible success. Few hardly dared to hope for it, though there was no earthly reason why the speed of an American car, the skill of an American driver and the fortune of a game with so much of luck to it should not justify the prophets in figuring in the Yankees in the calculation. Tracy had a fast, reliable car, which he drove with judgment and skill. Had he mingled less of caution—which was only natural—with it he might have won a place even higher up in the line. Anyhow, it was proved that America could produce a car, a designer, a set of tires and a driver well fit to cope with Europe's best, and Europe now realizes this.

Another international race on Long Island next year is a certainty. If France does not see fit to or cannot under local conditions or the possible demands for a Bennett cup race, run the Vanderbilt on her soil next year, she must return the cup to the commission to be competed for in the country which won second place in the contest and donated the cup besides. If the Vanderbilt race be run abroad, those high up in A. A. A. counsels say that a new international cup will be put up to be run perpetually on American soil.

To Chairman Morrell, who has worked unselfishly for 2 months in his cheerful, business-like way, belongs the chief credit of the race being run at all and being run so well. His unfailing diplomacy, abundant good humor, inexhaustible resourcefulness and untiring hustle secured the permit of the Long Islanders for the race to be run, won the farmers to the side of the automobilists, dispelled all the obstacles as they arose day by day, laid out the perfect system for the safety of drivers and spectators and the information of the public, and resulted in one of the best managed contests in the history of international road racing.

RECORD CROWD SEES RACE

America had a new sport record set for her today and the automobile did it. There have been Queen's cup yacht racers viewed by the living freight of 500 yachts and excursion boats. There have been great handicaps at the running tracks, championship ball games on the diamond and intercollegiate football contests on the gridiron, which have each attracted perhaps as high as 40,000 spectators. It was for the Vanderbilt cup race to draw a throng that must be estimated not by tens but hundreds of thousands. No one can more than guess at the numerical magnitude of the mighty concourse that

A FLAGMAN

A Bugler

grouped and crowded itself around the international automobile racing arena today. The double line encircling the entire 28 mile racing circuit practically without a break. It was jammed six or eight or ten deep along a ½ mile of start and 2 furlongs of homestretch. The Jericho, East Norwich, Bull's Head, Lakeville and new Hyde Park corners contributed thousands and the Guinea woods turn, the "S" at Albertson and the hairpin near by to Lake Success had hundreds of horror-seekers looking for trouble at these danger spots. Below these points the human avenue was almost unbroken, so that the racers chased through a lane of people the entire distance. Besides this, it must be remembered that but a part of the viewing crowd was afoot.

Behind them was another mighty throng. The official stand and the speculators' stands in its neighborhood held at least 5,000. There were scores, perhaps 100 other stands, erected in addition in the towns along the course. Between and behind the line of standing spectators were automobiles parked at every entering road, in every field and on every spot where squatting space could be seized or resting place hired by the curious.

Such was the amphitheater in which the gladiators of the motor fought out the battle of the speed and endurance of the thunderbolts of steel and the courage and skill of the great drivers of racing cars, drivers of the fastest and stoutest racing cars of four nations. How many spectators this open-air arena held is after all but a guess. That the world's attendance record at a sporting event was badly broken there can be no dispute. This contest, be it remembered, was waged on a course within an hour's ride of one of the great cities of the world, having a population of 3,000,000 itself and a million more at its very gates, which covered 28 miles of racing road.

Automobiledom was most conspicuous in the throng and the color of the picture was furnished, of course, by the motor cars, and furnished its thousands of followers, but the tens of thousands came from the people at large, to whom the attraction of the race was its internationality in part but more its stirring novelty, the marvelous speed flights it furnished and the danger of disaster to life and limb that hung above it. They say that Greater New York and nearby New Jersey have 10,000 automobiles. Whatever the metropolitan motor car census may be, it was all on hand to be counted, helped out by hundreds of cars that had been driven to the course for the occasion from even so far west as Chicago; for during the past fortnight Long Island has been the Mecca of tourists from the entire country east of the Mississippi river.

All the week the motor cars had been gathering in New York and many had been seeking storage at the improvised roadside garages, in the sheds of the inns and in the barns of the farmers. The final rush, however, began on Friday afternoon. From that time until close to the hour set for the start there had been an undiminished line of cars 2 or 3 blocks long awaiting their turn to cross the ferry at Thirty-fourth stret. Hundreds sought the course beside by the two East river bridges. During the 4 hours following midnight this morning, however, the rush was the greatest. There had been ante-daylight breakfasts served at all the uptown hotels, but the majority had been making a night of it with more attention to the cafe than to the restaurant.

When these race-going streams of automobiles reached the common channel of Hoffman boulevard, Hillside avenue and the Jericho pike they formed a crowded, unbroken torchlight procession, with the illumination feature thrice magnificent because of the brilliancy of headlights and the dazzle of gas lamps. The marching tune was the chug of the motors and the yelp of the horns. So much for the motor car contingent of the crowd.

There was another contingent of race-goers from the city who went for the spectacle's sake, to gratify their sporting proclivities, to be present because a big event was on hand, or to be there to see a great international struggle, which was sure to develop wonders of speed and perhaps horrors of disaster. The trolley lines leading to the ferries and bridges were jammed with them from midnight on. They were to reach the course by the trains of the Long Island Railroad from Hunter's Point and Flatbush. There were trains scheduled to leave for Mineola at 3:35 and 5 o'clock and for Garden City at 4 o'clock. The engines pulled fifteen cars each and seats, aisles and platforms were jammed. A big suburban population of city business men is on Long Island. To a man each had taken a holiday for the day and to a boy there had been a dead grandmother or a sick sister in every family. All this vast throng headed courseward with the rest before daylight.

The farming population of Nassau county had forgotten for a week carrots, cabbages and celery. There was more money in

THE IMMENSE SCORE BOARD

letting cots at $5 and leasing parking space in cornfields at $20 or selling sandwiches, coffee, cider or milk by the roadside than in truck farming. The adults not busy hustling for the nickel, the dime, the dollar or the yellowback had made a night of it in the roadside taverns, or hitched up their Sunday buggies or everyday truck wagons and filled them with wives, daughters and relatives and sought early advantageous view places along the road. The small boys and the girls at home perched on the fences or made grand stands out of porches and farm wagons. Nassau county now thinks automobile racing all right and vigilance committees are now ready to visit vengeance should any miscreant throw nails or broken bottles along the course. Should there be no race next year Nassau county will go into mourning and have as big a grudge against the automobilists for staying away as they originally had for their coming. MOTOR AGE last week thought the race would bring a half a million dollars into the county. In view of last night's crowding of inns and farm houses with lodgers at $5 per, fields with cars at any old price and stomachs with all the cows, the gardens and the kitchens of the county could yield, and its tavern bars pour out, it begs to raise its guess to a million.

NIGHT BEFORE THE RACE

The night before the race was a night to be remembered. Over at the Garden City hotel, whose normal capacity is probably 300, there were surely treble that number accommodated; the rooms were jammed with cots and even the floor of the billiard room was pre-empted for mattresses for sleepers. In the writer's room, built for two, there were two double and two single beds and a cot in the bath room besides. In one room four women slept in one bed. There were 100 more at least who came for rooms only to get a polite smile at the desk and sat up all night in the foyer or on the porch or helped to make night hideous in the cafe. Part of the enclosed veranda was pressed into service as an emergency dining room. At the long tables one encountered tradesmen from all over the country. It was a gathering of all Yankee automobiledom. One might have thought that the hotel people had been given a contract to house all the exhibitors and attendants of a national motor car show.

There were the same crowding and the same setters up, only worse, over at Krug's near the stand and at all the hostelries along the course. Mine hosts had also leased rooms in neighboring farm houses and still there was not room.

So much for indoors. Open air camping out was universal along the course. Owners either sought squatting plans for their cars during the night and slept in them as best they could, or left their chauffeurs to keep their places and sought near by barrooms for all night entertainment.

Sleep? Nonsense! Who could sleep or who cared to sleep if he could, with so much to think of and talk of with such a momentous event but 3 or 4 hours off. By 3 o'clock the waiting throng at the Garden City hotel and in all the taverns and farm houses in the county began to hustle itself. Four o'clock breakfast was the rule. A half an hour later everybody was en route to the course.

It was a beautiful, almost balmy night—remember, sun-up time was still almost an hour away. Glorious moonlight illumined the scene. And what a scene it was in the neighborhood of the grand stand. The road was jammed with honk-honking, blazing automobiles, overloaded wagons and swarming foot passengers. Already the mile wire barrier was lined five deep. Behind stands were filling up and cars were crowding into place.

"Parking spaces here! Seats to see the race! Get your breakfast now! Only official programme of the race! Get out of the way! Look out, there!" could be distinguished in the combined roar of the crowd struggling a-foot, a-motor and a-wagon. Up and down the road were lights, lights, lights.

It was a riot of confusion worse confounded, made worse still by the babel of many shouting tongues of accents that smacked almost as often of Rome, Berlin and Paris as of Chicago and New York, and the start of the race was now but ½ hour away. Everyone was determined to see all that was going on a despite its eagerness not to miss anythi the crowd was a most orderly one, althoug somewhat hard for the deputies to hand

LINEUP FOR START

Lancia, red-shirted and helmete pushed his giant Fiat through the crow toward the tape. He was the first to a rive. His coming seemed to wake up t officials to the realization that somethi must be doing at once. Referee Vand Lilt was first on hand. Chairman Morr was there, too. A word of conference w young Willie K. and Bobby set his hundr picked, broad-shouldered deputies to wo In a jiffy cars and wagons were turn back and the crowd was hustled scrambli behind the ropes. Word was phoned close the course. The distant road clear into a long, open lane through the waiti thousands. Near by the jam of people a vehicles had given way to the fast gath ing racing cars. Each was promptly giv

objective points of curious eyes not engrossed by the racers and the race. Behind the stand the A. C. A. had prepared a tent for breakfast and luncheon and another for the reception of women.

The grand stand was by no means an altogether bare board affair; for Chairman Morrell had seen to it that its front was draped with the colors of the four contesting countries.

It was around the racing cars now in line, however, that interest centered. Each was the center of groups of partisans and compatriots. In four tongues echoed the babel of expert advice, cheering encouragement and woman's kindly ministrations. There were suggestions, warnings, entreaties and kisses au revoir and perhaps good bye. There was something of solemnity in the final greetings, which to some extent extended to the attitude of the onlookers. There was a realization that death might come to some friend or a fatality be the outcome of a contest without dispute one rife with possibilities of mortal disaster. That death is a contingency is perhaps as great a factor toward the thrill of these races as the uncanny aspect of the racers and their pilots and the marvelous speed flights of the cars themselves.

Now the man in the moon turned off his light and the dawn, first gray, then rosy came. Phoebus gathered up the reins of his steeds for his daily race across the heavens. It was the eve of day—bright, glorious and full of promise of Indian summer balm. The racers were all lined

Tire Repair on the White

up, their drivers nervous, no doubt, but eager to have the contest on and the suspense ended. Wag, attired in an entire suit of russet leather—cap, jacket, knickerbockers and leggins in honor of the crowning moment of his career as official starter—stood mumbling for the thousandth time his newly learned and incessantly rehearsed starting count in French, which was to send off the foreigners. The spectators, no less nervous as those who wait the "play" of the umpire, the kick-off of the ball, or the "go" of the referee in some great combat of the diamond, the gridiron or the river, were on the qui vive for the long expected race to be on.

Jack Kerrison, of the Chronograph Club of Boston, took his stand at the head of the line, watch in hand, with Wag looking over his shoulder. Vanderbilt, Morrell, Hollander and de Turckheim flattened themselves against the stand. Down the road a long line of red flags waved.

"Dese, nuf, weat, sel, siezo, sank, cattre,

BIG ROAD RACES AND THEIR RESULTS

traw, de, partay," said Wag without a slip, pumping his hand with each count. A crunch of the clutch, a puff of fire belched from the exhaust and the great race was on.

In 18 minutes all were away but Christie, his pursuer being sent off 2 minutes behind him as per schedule. There was a hasty inquiry for the reason of his absence. There was no time for more, for who could tell how fast was to be that first mad lap and how soon the leader would loom up into sight?

"Car coming!" bawled Prunty through the megaphone.

There was a quick craning of necks up the road. Was it Jenatzy? Was it Duray? Was it Dingley? Was it Lancia?

An approaching roar, a z-z-z-zip and a motor—driven thunderbolt manned by two uncanny demons, shot by. There was but time to catch No. 1 as it shot by and was lost down the human lane. It was Jenatzy.

"Car coming!"

R-z-z-z-z-z-zip.

It was Lancia. He had eaten up in one short round the minute intervals that separated him from Dingley just ahead and Duray just beyond and was off in mad pursuit of the flying Dutchman, Jenatzy, who happens to be a Belgian.

The twelve telephones with Prunty's megaphone told the story of the day, the progress of the racers, the rumors of their disasters, the tales of their misfortunes. There was no let up in the interest. At intervals not greater than 2 minutes on the average the cars flashed by. But all the time Prunty's clarion voice bellowed through the pasteboard funnel the story of the race and the chalk artist put the figures of the completed laps in elapsed times on the two great bulletin boards on top of the press stand.

There was no flagging of interest, no leaving of seats. From start to finish the eyes and ears of the spectators were fixed on the race. There were cheers for favorites, groans at bulletins of collisions, and hand clappings at stories of disasters panning out more bruises and broken cars.

There were crucial moments at the stand. Lytle had lost his mechanic. Was he killed? Keene had crashed into a telegraph pole. Was he injured? Lancia and Christie had collided? Which was killed? Was Lancia out of the race? No, he was not. He had started again. A cheer. But he was too far behind to make up lost time? He surely was. What a shame that he who had ridden so well and so well earned the cup should be robbed of it by an accident.

But who will win now? Will it be the handsome American, Heath, or the dashing Parisian, Hemery? Nine laps and Heath is at the very heels of Hemery, but 7 seconds away. But stop. Hemery has started 3 minutes back of Heath. He must beat him more than that at the finish to win.

There is an anxious, eager wait—broken broken only by Lancia madly rushing by in his fruitless chase. Then "Car coming" breaks the suspense. In an instant a car flashes by. It is No. 18. It is Hemery. France has won—and there is a bedlam of Gallic cheers and hospitable American applause as the Darracq driver slows down a bit further and takes in an official to escort him to the weighing stand.

There has been hardly time for cheers, though, for 100 yards behind him flashes another car.

"It is Heath!"

It wasn't. It was Sartori winding up his eighth lap. A few seconds more and it was Heath indeed.

A long wait and Joe Tracy flashed by in the Locomobile—the first American driver and car to finish a cup race and win a leading place in it.

"Well done, Joe!" and then a good Yankee cheer and then a rush to shake Riker by the hand.

Next came Lancia. He slowed down and rode slowly up to and across the tape and then stopped. He got the great reception he deserved. Again had the hand of fate robbed the gallant Italian of a victory within his grasp just as it had in the Bennett race 3 months before. He gesticulated wildly. They say he was not lodging a protest, but only telling in his impetuous way how it all had happened.

Spectators broke through the lines and rushed toward him. Yellow flags waved frantically. At a word from the referee the telephones told the people at all the turns and timing stations that the race was off and that the others had stopped.

For a second time today the highway

Telephone Station at Grand Stand

Digitized by Google

teemed with people, wagons and automobiles. An hour later farm wagons again trundled over the road and Nassau county entered again upon the humdrum of its normal existence.

When the race was called off Sisz, Nazarri, Sartori, Dingley, Warden, Duray and White were still running, Dingley with three cylinders, the fourth having been plugged as an emergency repair—seven in all, in addition to the four finishers.

Of the derelicts Jenatzy was laid up at Bull's Head with a cracked cylinder, Keene had crashed into a telegraph pole, Christie had collided with Lancia, Wagner had had tire and engine troubles galore, Cedrino had skidded into a pole and bent an axle. Campbell was stranded with a leaky gasoline tank, Lytle had had a lot of tire trouble and cracked chain and steering gear in a mix up with a dog and Chevrolet's front axle was down and out.

a Fastest lap in race. b Christie collid

There was no actual confusion, but the nervous tension everywhere was higher and the crowd on hand was a great deal bigger than 12 months ago.

Just on the second of 6 o'clock Jenatzy got the word to go and he got his car under way in a fashion that made it seem like a thing alive. Sixty seconds later Duray made about as good a start. Dingley and his assistant, dressed in khaki this time instead of black leather, came to the tape, literally smiling. There was no nervousness in that car and it got away well. So it went, at 1 minute intervals, car after car being dispatched without a mishap. Every car belched forth the smoke of burning lubricants and most of them made a good getaway. Foxhall Keene, wearing a gray overcoat, such as he might in a touring car, got away in fine style. Wagner, in his Darrneq, was a trifle slow. Joe Tracy, with a big orange-hued kerchief found about his neck, did well. Nazarri immediately after starting removed both hands from the wheel and waved them, as to friends. Warden could not be seen through the smoke from his exhaust pipes. Sisz made rather a poor start. Christie was not on hand when his turn arrived and there was an interval of 2 minutes between Sisz and Cedrino.

Before Campbell, driving the Mercede on which S. B. Stevens has chosen to carr a cross instead of No. 13, had been started the reports of Jenatzy's progress began t be shouted through the megaphone. Firs he was reported from the 10-mile poin and next the 15-mile station. He covere the first 15 miles in a little less than 1 minutes. Campbell made a good start an so did Heath, the latter waving his han as he swept away. Lytle drove to th tape chewing gum and looking unconcerned. Chevrolet and Hemery got awa handily. Walter White caused amusemen by starting very slowly and putting hi hand on the emergency brake, whic caused catastrophe on September 23. Sartori was on time this year and got awa from the line in fine style at the word.

With nineteen cars running there was n dullness for the spectators. From 6:24:5 o'clock, when Jenatzy finished his firs round, the cars kept popping by with deafening rush at intervals of a minut or so, often only a few seconds apart

BATTLE BY ROUNDS

At 5 minutes before 6 o'clock Peter Prunty, announcer, tilted his megaphone at the assembled multitude and introduced a noisy cloud of yellow smoke that had just come to the tape as Jenatzy. The queer-looking Belgian may not have been nervous, but he talked in a very excited manner and gesticulated frantically all the while he waited for the word to go. Duray had his car lined up, just behind Jenatzy and he left it to shake hands with his rival. Vanderbilt and several others did the same and a big man who had no official badge of any sort broke from the ranks to wish the Mephistophelian-looking man good luck.

"I saw you win in Ireland!" he exclaimed as a sufficient justification for this action.

The excitement at the time of start was much greater than at the race of last year.

Eleven cars had finished their first lap when Christie came rushing along and crossed the tape with a flying start. It was actually 6:38:35 o'clock when he started, but his official time was recorded as 6:10, which was when he should have gone.

The only delay reported on the first lap was one made by White at Bull's Head because of tire trouble. There was practically a tie in the second round also. Keene's time and Hemery's were the same except that ⅜ of a second was added to Keene's time when he passed the stand lapped on Sisz. It was interesting to note that Cedrino's time for this lap, 28:18, is at just the pace of a mile a minute. At the end of the second round Jenatzy again was first to pass the start, but Lancia followed him in 55 seconds and was shown to have a lead of 2 minutes 4½ seconds over Sisz, who was second. In this lap Wagner passed Duray while Sisz passed Nazarri, Dingley and Keene. The biggest jump in point of actual place was made by Hemery, who moved up from fourteenth place to sixth. Some thrills were afforded in this lap by Sisz coming past the grand stand almost dead abreast. Sisz had a yard or two the better of it and the timers separated them by ⅕ second. Not quite 4 minutes later Dingley came along, with Tracy only 100 yards behind. On this lap more tire troubles were reported on by White, Nazarri had a puncture, Lytle's mechanic was thrown out at a turn and Hemery nearly overturned in a ditch while making the double turn on Willis avenue. Campbell dropped out because of a broken tank. The round summarized as before and showing all changes, follows:

No. 1, Jenatzy, third; No. 4, Lancia, first; No. 6, Wagner, fourth; No. 2, Duray, eleventh; No. 10, Sisz, second; No. 5, Keene, seventh; No. 7, Tracy, twelfth; No. 3, Dingley, fourteenth; No. 9, Warden,

Even before the first round was finished, it began to look like Lancia's race. It was known that he had passed Dingley before reaching the S turn at Willis avenue, and that he had passed Duray before Lakeville was reached. There was a good cheer for him when he passed the stand less than 2 minutes after Jenatzy, and it was made known that he was leading by 1 minute and 3 seconds. Next to Lancia and Jenatzy, Sisz made the best showing in this round, coming around in eighth place and being third in point of time. Wagner moved up a place by passing Keene. Dingley was passed by Lancia, Wagner and Keene and Tracy was passed by Nazarri and Sisz. Heath and Lytle each moved up a place, Hemery moved up two places and so did Sartori. A hot pace was set from the beginning. Seventeen of the nineteen starters covered the first lap in less than 30 seconds. Twelve ran it in less than 30 minutes. Twelve ran it in less than a mile a minute.

A summary of the lap, giving the names of the drivers in the order of passing the grand stand follows, the first number, at the left of the name, being the official one and indicating the position in which the man started, while the figures at the right hand of the names tell the actual position in the race held by each because of the time he made:

No. 1, Jenatzy, second; No. 4, Lancia, first; No. 2, Duray, seventh; No. 6, Wagner, fourth; No. 5, Keene, eighth; No. 3, Dingley, seventeenth; No. 8, Nazarri, fifth; No. 10, Sisz, third; No. 7, Tracy, twelfth; No. 9, Warden, ninth; No. 12, Cedrino, sixth; No. X, Campbell, thirteenth; No. 14, Heath, eleventh; No. 15, Lytle, sixteenth; No. 16, Chevrolet, fifteenth; No. 18, Hemery, fourteenth; No. 20, Sartori, tenth; No. 11, Christie, nineteenth; No. 19, White, eighteenth.

On this lap there was a tie between Warden and Sartori for ninth place. Their elapsed time was the same, but for the sake of preserving the succession the place is given to Warden in the summary because of his prior order in passing the tape. It will be noted that the car on which Mr. Stevens preferred a cross to the number 13, finished thirteenth in this first lap and didn't come around any more.

LANCIA ON THE STRETCH AT THE FINISH

NAZARRI SKIDDING ON THE BULL'S HEAD TURN

Digitized by Google

SCENE AT THE START WHEN KEENE WAS SENT AWAY IN FIFTH POSITION

ninth; No. 12, Cedrino, fifth; No. 14, Heath, eighth; No. 18, Hemery, sixth; No. 16, Chevrolet, thirteenth; No. 20, Sartori, tenth, No. 8, Nazarri, fifteenth; No. 11, Christie, sixteenth; No. 19, White, seventeenth; No. 15, Lytle, eighteenth.

At the end of the third lap Lancia was first not only in point of time, but was also leading the whirling string of racers. He passed the stand nearly 9 minutes before Jenatzy appeared and the time pieces showed that he had a lead of just 4 minutes over Sisz, who was again second in the official time records. In this round Cedrino came to grief at the telegraph pole, and there were only seventeen finishers of it. It was in this lap that Duray had his first trouble with tires. When Christie came past, his engine was skipping badly. There were a number of changes in this round, among the most interesting being the moving up of Heath, who was driving a careful, even race, jumping from eighth place to fourth in point of time, while Hemery slipped from sixth place to fourth.

Summary of the round: No. 4, Lancia, first; No. 1, Jenatzy, sixth; No. 2, Duray, fifth; No. 10, Sisz, second; No. 5, Keene, ninth; No. 9, Warden, eighth; No. 7, Tracy, tenth; No. 14, Heath, fourth; No. 6, Wagner, twelfth; No. 18, Hemery, third; No. 20, Sartori, seventh; No. 16, Chevrolet, eleventh; No. 8, Nazarri, thirteenth; No. 19, White, fourteenth; No. 15, Lytle, fifteenth; No. 11, Christie, sixteenth; No. 3, Dingley, seventeenth.

The first big cut made in the number of competitors came in the fourth round, when Wagner, Jenatzy and Christie had their troubles and withdrew. At the end of the fourth round Lancia had further increased his lead and Heath had taken second place from Sisz. Sartori was then coming to the front, having gained third place, while Warden was fourth and Sisz fifth.

The lap summary: No. 4, Lancia, first; No. 9, Warden, fourth; No. 5, Keene, sixth; No. 14, Heath, second; No. 10, Sisz, fifth; No. 7, Tracy, seventh; No. 20 Sartori, third; No. 2, Duray, tenth; No. 18, Hemery, eighth; No. 8, Nazarri, eleventh; No. 16, Chevrolet, ninth; No. 15, Lytle, thirteenth; No. 19, White, twelfth; No. 3, Dingley, fourteenth.

It was in the fourth lap that the fastest time in the race was made, Lancia completing the round at the average speed of 72.94 miles an hour. The fifth round and half of the race was finished by twelve of the nineteen starters. It was on this turn that Lytle dropped out after hitting the fence. White was still going, but he did not finish the lap before the race was called off. On this lap Keene loomed up as a rival of Heath for second place by moving from sixth position to third. Lancia had increased his lead so that his victory seemed a foregone conclusion. At the end of half the race he had a margin of 13 minutes 16 seconds over Heath and was going like wildfire. Sartori had dropped back to fourth place, while Sisz retained fifth position. Summary of the lap: No. 4, Lancia, first; No. 5, Keene, third; No. 14, Heath, second; No. 7, Tracy, seventh; No. 10, Sisz, fifth; No. 9, Warden, eighth; No. 2, Duray 9; No. 20, Sartori, fourth; No. 18, Hemery, sixth; No. 8, Nazarri, tenth; No. 16, Chevrolet, eleventh; No. 3, Dingley, twelfth.

All this while Hemery was not attracting much attention, not any as a possible winner. He was driving a consistent, plugging race and had been moving up and slipping back. In the sixth lap Hemery moved again from sixth place to third, Keene having broken his car. Only ten finished the sixth lap, Lancia, Heath and Hemery being first, second and third. Sixth round summary: No. 4, Lancia, first; No. 2, Duray, sixth; No. 7, Tracy, fifth; No. 10, Hemery, third; No. 8, Nazarri, eighth; No. 9, Warden, ninth; No. 10, Sisz, fourth; No. 14, Heath, second; No. 16, Chevrolet, tenth; No. 20, Sartori, seventh.

SISZ IN RENAULT GOING FULL SPEED

In the seventh round the actual positions of the first three men were unchanged, although Lancia had increased his lead. Only nine completed this round, Chevrolet having dropped out with a broken axle. Here is the order of finish and actual positions: No. 4, Lancia, first; No. 14, Heath, second; No. 18, Hemery, third; No. 7, Tracy, fifth; No. 10, Sisz, fourth; No. 8, Nazarri, sixth; No. 2, Duray, ninth; No. 20, Sartori, seventh; No. 9, Warden, eighth.

Round number eight was the eventful one, when the fortunes of the race changed in a way that disappointed everyone. Christie had been making repairs since the third round and was running again, when Lancia pulled into the road from the Fiat station, where he had stopped for oil. The collision between them delayed Lancia enough for him to lose all the benefit of his magnificent running. In spite of all he could do he was sixth in the time table at the end of the eighth lap with the remaining distance of the space too small for him to regain the lead. It was in this lap that Hemery took the lead after both he and Heath had done some hard running for the place. In this lap only eight finished before time was called. The summary of it tells its own story: No. 18, Hemery, first; No. 14, Heath, second; No. 8, Nazarri, third; No. 10, Sisz, fourth; No. 7, Tracy, fifth; No. 4, Lancia, sixth; No. 20, Sartori, seventh; No. 9, Warden, eighth.

Throughout the eighth and ninth rounds Lancia drove like a demon. Heath and Hemery and Tracy also had all increased their speed. The excitement in the stands during the last 2 laps was intense. Lancia passed Nazarri and Warden and made up enough time to be in third position. Tracy beat Sisz out of fourth place, in the ninth round, and Heath tried in vain to get the lead from Hemery. Only five finished this next to the last lap before the race was called off and their order was: No. 18, Hemery, first; No. 14, Heath, second; No. 4, Lancia, third; No. 7, Tracy, fourth; No. 10, Sisz, fifth.

How Tracy gained third place in the last lap and scored the first notable achievement with an American car in a big road race and how Hemery kept his lead over Heath and won the race has already been told.

THE CONTEST BY MEN

A race like the Vanderbilt is, after all, largely a race of men rather than machines. The spectator not of the trade speaks of the position of Hemery, Dingley, Heath, etc., not of where or how is faring the Darracq, the Pope-Toledo, the Panhard, etc. Yet when the facts are analyzed it is the combination of the man and the machine which was competing on the Nassau circuit last Saturday. A story which tells what each man did and what each machine did, complex as were their relations to each other, is the real story of what happened. The co-relation of one man to another, of one machine as regards its competitor, of one lap to another—these are for the ultra-technical to gloat over. The student of human nature is interested rather in the individuality, the work, the accidents and the glory or grief of the men who participated. Hear then the tale of the people:

Digitized by Google

No. 1. JENATZY—The first of the German cars was the pathfinder. Jenatzy's mission was to push forward and find his way where no other car had preceded him along the oil-soaked course. He had nothing to guide him. He did not know whether the flagmen and special officers had done their duty. He had to trust to what the donor of the trophy called the "inherent good sense of the American people," to be sure that he would not plow through the masses which had gathered to see the contest. Jenatzy came to the starting point at least a good ½ hour before the time called for. He stood about and visited with friends, chiefly Frenchmen, for this Belgian driver of a German machine on American territory speaks no English. He investigated the car to see that all was in order and admonished his mechanic, Bariz, concerning the condition and handling of the car. Jenatzy has been a veteran too long to neglect any of the details. When he started his engine and rolled to the tape, he had put in plenty of oil, as was evident from the dense cloud of dirty yellow smoke which rolled out and enveloped the press stand so that no one in it could see the car or driver. Through the smoke-cloud came the sound of Wagner in bad French, calling the seconds before the start. Jenatzy was nervous. He fumbled with the levers and shook hands with Mr. Vanderbilt and others and watched the starter and Kerrison who held the watch and glanced about him with quick, bright glances. But when he received the word to start, he stiffened up and was as adamant as he grasped the steering wheel and started the power into the driving chains. He made a good start, the machine bucking slightly and then getting down to business. Jenatzy struck a good pace right from the start. He found the roadway unimpeded and, knowing what had been launched at him from the rear, felt it his duty to keep as far out of the way as possible. He drove without troubles of any kind for one lap. It was he who sailed past the crowded stand in his proper position and he was almost the only man who did so. He had everything to himself at that time. It was on the third lap that he made a stop for oil at the East Norwich control. He was delayed only a few seconds and pushed on, still holding his own fairly well, though Lancia was at that time considerably ahead on elapsed time, if he had known it. It was on the fourth round as he drove hard at the Bull's Head turn that he noticed the car was not giving its proper power. He pulled up at the side of the road and made a hasty inspection. He found out that he had cracked two cylinders, probably under the strain of making the turn. This settled Jenatzy, and as he softly swore to himself he realized that he had no chance. Now Jenatzy has driven in so many races that it is evident to him when he is beaten. He wasted no time in trying to accomplish the impossible, but secured a tow and left the course. He might have been a factor had his machine held together. The fracture of the cylinders was similar to that which happened to C. G. Dinsmore's machine last year. Jenatzy probably made the fast drive at the Bull's Head turn because he did not realize that he was out of the woods until the corner was upon him. The fact that one comes to the Bull's Head when one is least expecting it, is the reason there were so many incidents and accidents at this point.

THE DUCHESS OF MARLBOROUGH

No. 2.—DURAY—Duray's blue de Dietrich flashed past the stand with a great deal of regularity. He had come to the tape rather calm for a Frenchman. He was a decided relief after the antics of the nervous Jenatzy. But like all the Frenchmen, Duray carried an intimation in his manner that he was playing to the grand stand. He had unbounded faith in his machine. His start, however, was not so good as that of the man who preceded him by a minute. His mechanic was named Frankville and was an agile little fellow. Duray also ran steadily for a lap or two. In the fourth round, however, in the North Hemstead backstretch, a stone flew up in the carbureter and jammed the gears. There was a wait as many cars flew past, while Duray examined the damage. He found that his intermediate speed gears were in bad shape. Some of the teeth had been ground away and it was necessary for him to use high speed. This he did when he got started, somewhat behind. He drove hard and on the turns did either of two things, ran on his first speed and crawled around them, or drove on his high speed and trusted to whatever diety a French driver worshiped. It was a frightful chance to take, but Duray took it at Jericho, and at Hyde Park. Thrice Duray had to stop to adjust the gears. Each time he had his tires inspected and once, at Jericho, he had a new tire placed on one of the rear wheels. He was still running when the race was over and was stopped by telephoned directions from the grand stand. Duray was expected to be the dark horse among the Frenchmen. It is said that he it was who tried to organize the French drivers into a team and have the work done under signaled directions from the stand. But he failed because Heath refused to drive in a combination. There is an intimation that the Darracqs were actually driven by signal. This will be explained later.

No. 3. DINGLEY—Dingley and his mechanic in khaki looked very businesslike as they came to the tape. They were greeted with a cheer, the first sound which the grand stand had made, aside from the buzz which betokened much conversation. Evidently the grand stand expected a great deal of Dingley. He made the first lap in fairly good time. It was in the second lap after he had rounded the S turn that he cracked a cylinder. Dingley was a long way from anywhere. He could not get a telephone and there was nothing to be done but to take a walk to the Lakeville control. He walked or ran the two intervening miles and got the tools to sever the pipe connections. Then he was driven back in the Pope tender car to the scene of the trouble and there he made the repair and took up the work of driving again. He had to run on three cylinders and this he did, being still in the running at the close of the race. But Dingley was also hampered by tire trouble which overtook at two points on the course. Nearly all his broken tires and other delays came at the western end of the course. "It is the hoodoo locality," he said.

No. 4. LANCIA—Possibly Lancia means "lance." It ought to, anyway. Lancia was one, as he cut through the field and had all the race at his mercy up to the fifth round. He was leading after that.

LOOKING SOUTHEAST FROM THE PRESS STAND

NAZZARO STRAIGHTENING UP AT LAKEVILLE

HEATH'S FINISH

KEENE TURNING CORNER AT NEW HYDE PARK

for even a smashed car can do some running and Lancia was miles and miles ahead of his nearest rival. Lancia looked worried as he prepared for the start. He had a heavy look as if he was thinking too much for an Italian. He stood waiting for the word, given to him in French, his big machine rattling like a truck going over heavy cobblestones. It was quite the loudest exhaust the grand stand had ever heard. There was power in every vibration. Lancia wore a sweater of gray material and looked somewhat illy prepared for the race. He wore a white collar under the sweater as if he had been called suddenly from some cleaner occupation to drive the race. The on-lookers gasped as he left the stand, so fierce and sudden was his dash to the fore. From that time on, Lancia's course was simply described in one word—speed. He sacrificed everything to it, except care at the Lakeville, Bull's Head and Willis avenue turns. These places he approached with a good deal of dash, but shut down as he took the actual corners. This was noticeable during the early stages of the race. After the collision with Christie, Lancia grew more reckless. It was then a question of holding enough of his lead to win and he took every possible chance. Lancia stopped once at Lakeville for a puncture and had a Michelin fastened to a front wheel in record-breaking time. He thought he needed another set of tires on the fifth round and stopped to have them put on at the control near the S turn, also having water and oil renewals. As a matter of fact, Lancia figured that the race was half over and that he would be better off if he ran the second half with a new equipment. He stopped just a moment too long, however, as it happened. As the work was completed and Lancia had climbed back into his car the flagman nearby shouted, "Car coming!" Apparently Lancia did not hear the call. If he did he did not understand it, nor did he grasp the meaning of the frantic motions which the flagman was making to hold him back. He shot into the road just as Christie came along and the two rear wheels of the two machines came together. Lancia had had time to turn slightly and the blow was a glancing one, so that, instead of being utterly demolished, he received only a broken rear wheel. Christie was less fortunate. The big blue front-drive car was whirled round and almost overturned and Leitner, the mechanic, went flying for 30 or more feet and landed against the base of a large tree, knocked out. A great crowd at once surrounded the two machines. A physician who happened to be present went at once to the aid of the injured man. The crowd evidently supposed that Lancia had done this thing deliberately. They made a rush for Lancia, who did not understand what they were about. He stood calmly watching them, but when it was explained that they deemed him almost a murderer, he grew excited and explained volubly that he had not known that Christie was there and that if he had tried it, he was just as likely to have been killed as the occupants of the other car. The logic of this thing translated to the crowd seemed to abate its fury for it faded away from Lancia's locality and spent its time looking at the wrecked American car. In the meantime, Lancia's mechanical force had got to work and had replaced the injured wheel. The Italian was ready to start in less than 20 minutes from the time the injury occurred and was on his way a moment after in an effort to hold his lead. But a crippled car cannot go as fast as one in good condition and the Fiat was undoubtedly injured more than showed on the surface. Lancia was unable to make the time he had been making and fell steadily behind. In the eighth lap he had tire trouble and more trouble with the wheels and steering gear and there was a further delay which served to set him back long enough to lose the third place to Joe Tracy, who had been plugging steadily forward, holding his own. Lancia ran round to the stand after the race and explained things to Mr. Hollander, who entered the car. He was not inclined to shirk the blame and said frankly that the collision was his own fault. But he alleged that he had not used undue carelessness and that he had been improperly warned. Mr. Christie was not inclined to blame Lancia after the race was finished. He said it was one of the incidents of road racing and he and Lancia had been the sufferers and that there wasn't anything further to be said about it. Had Lancia not suffered the collision, he would undoubtedly have set a new record for road racing. During the time his car was in trim he had every record ever made beaten to a frazzle and drove with consummate ability. His first 4 laps were made at an average speed of over 70 miles an hour. His fourth lap, in 23:18, was at the rate of 72.96 miles an hour. This is running some.

No. 5. KEENE—Foxhall Keene drove a fine race, but was a little too daring on the curves. This eventually was the means of his being taken off as a contestant. He was perfectly cool at the start and continued so throughout the race. He wore a heavy gray ulster and didn't look much like a race driver. His mechanician Luttgen, was dressed in black leather and seemed nervous. Keene spoke to him just as the car started. The start was good. From first to last the running of Keene was steady and fast. He climbed from a low position to a high one and was next the leader when he ran into the telegraph pole at the S turn and was down and out. He stopped once for gasoline, but outside of that had no delays. He had absolutely no tire trouble. Keene met his finish at the pole which, situated just at the first turn of the Willis avenue S, was a menace to every driver in the race. The racing board had made ineffectual efforts to have it removed. Keene would not have hit the pole if he had slowed down more. But he skidded and it was the pole which stopped the skid. Luttgen had leaned over to avoid the pole and the shock threw him across Keene's face and down between the wheels on the driver's side. He managed to roll under the body of the machine and escape the wheels of Keene's car and those of Heath's Pierce-Arrow which almost went over him as the latter sped by. Keene drove the car up in the field near by and after looking it over abandoned it and went back to the stand. He was told that he was second in the race and said it was "awfully hard luck, but—with a shrug—it was only luck, don't you know."

No. 6. WAGNER—How much credit should be given to a story which was

told after the race is doubtful. This was to the effect that the two Darracq cars were run by a man in the stand who with two assistants on other points of the course dictated to the drivers by signals how they were to drive and at what speed. It doesn't really make a great deal of difference so far as Wagner was concerned. He had ignition troubles in the third round which put him out of the running. Wagner had the first car without a hood which came to the tape. He and his mechanic wore sweaters with the word "Darracq" on their chests and looked nervous. Wagner made a good getaway and ran well for the 2 laps when he was a factor. On the second lap he burst a tire on a rear wheel as he passed the stand and called forth some excitement by dodging a man with a camera who persisted in crossing the track ahead of the car. Wagner said afterwards that he had not seen the man. It is probable that the man was not as near the car as the spectators imagined. Wagner had no other tire trouble than this during the time he was running. He took his early retirement cheerfully and said the breakdown was such as might have happened to anyone. He said it was not the fault of anyone in particular, but refused to explain it.

No. 7. TRACY—Joseph Tracy, with his yellow handkerchief about his neck, drove through the race without scarcely stopping. Three stops for oil and gasoline during the whole ten rounds were all that were recorded and so far as could be ascertained he had no tire trouble. The machine ran steadily and without missing and Tracy simply pounded away and waited for the foreigners to tire out or for the inevitable accidents to occur. He took no chances at the turns and altogether drove a consistent and careful race. His securing third place was as well as he could have done with the machine he drove, which he had had fitted with two new cylinders the night before and he is deserving of great praise for having made so good a showing and for upholding the credit of America in the race. His was the only American machine which made a good showing. Part of his success was luck, of course, but Tracy tried to make the luck as little of a factor as possible. Further than this, not much can be said of the details of his race. His rounds were made too consistently to allow of incident. He made a special spurt at the finish and earned the position which he gained.

No. 8. NAZARRI—It seemed when Nazarri got away from the grand stand, as if the Fiat which he drove was working on three cylinders. It was not running well by any means, though Nazarri seemed to be sure of himself. He took both hands from the steering wheel and waved them in the air as he started. He was decidedly gay. It was in the second lap that Nazarri had to stop at Jericho and look after his ignition. There were batteries and wires to replace and some changes to make which took up considerable time. It was this loss of time which put him behind and kept him behind all through the race. Nazarri kept manfully at it and was running on his last round when the race was called off.

No. 9. WARDEN—Warden was the second man to be cheered as he drew up alongside Starter Wagner. This was because he had been energetic and had replaced broken cylinders with new ones in time to enter the race. His machine, like that of Jenatzy, started in a cloud of smoke. For 4 laps he ran well and was well up in the list of those who might be among the leaders. But in the fifth, sixth and seventh rounds, Warden had tire trouble at various points around the course, and besides, his new cylinders did not work as well as they might. He simply lost time, lost time, and then lost more time until he was so far behind that his case was a hopeless one. Warden drove a careful race and took the corners in a gingerly manner. On the straights he let out the Mercedes for all that was in her.

No. 10. SISZ—Sisz was the interesting figure, from a spectacular standpoint, of the whole race. His machine was distinctive in appearance and was very fast. He was dressed in black leather, as was his Russian mechanic, Dimietrivietch. The great oval hood, painted red, marked the Renault at all stages of the game. Everybody knew Sisz. Everybody knew the Renault. As the car raced by the stand, neck and neck with Keene's Mercedes, one of the most exciting moments of the race was experienced by the spectators. Sisz's trouble was with his radiator. It began to leak during the first lap and kept it up steadily. Sisz had to stop repeatedly and refill. Once he had to stop far from a control on the Jericho turnpike and send his mechanic on a run to a farmhouse for water. While he was gone Sisz changed a spark plug and adjusted two more. A prominent engineer in the automobile trade, who stood near, said afterward that he had never seen adjustments and replacements made with such agility and speed. He said Sisz's fingers worked like machinery and that changes were made so fast that the eye could hardly follow them. Sisz was running when the race was called off and was a good fifth to Lancia's fourth. Had the race been a round or two longer, he would undoubtedly have overhauled the Italian and probably Tracy.

No. 11. CHRISTIE—Walter Christie lost time at the start. He was more than 28 minutes after his starting time when he entered the race with a flying start granted by the referee. He had tire trouble and ignition trouble, but on the whole was not doing badly when he collided with Lancia. At this time, he avers, his machine was running better than it had run at any time and he had hopes of gaining some sort of a position.

No. 12. CEDRINO—Cedrino's career was brief. He started well, made 2 laps without incident and was a factor in the game when he ran into a pole at Lakeville and smashed the steering gear. Then it was all over.

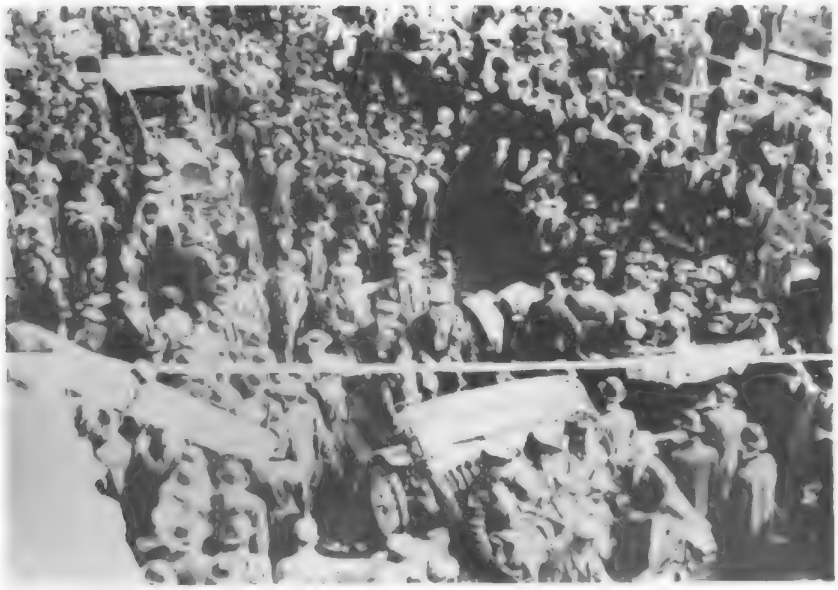
No. 13. CAMPBELL—Campbell was carrying the letter X in place of the number 13. But it was no use. He ran 1 lap and was then thirteenth man. Then he quit. A leaky gasoline tank did the business.

No. 14. HEATH—There is not much to tell about the running of Heath. He drove a race similar in all respects to the race driven a year ago on the old course. He avoided the sharp turns and speeded on the straightaway. He was calm, nerveless, steady. He lifted his hand in salute each time he passed the stand where his wife sat watching him anxiously. He did not stop during the whole course of the race except for the perfunctory duties of refilling his tanks, except once near the Willis

WILLIS K., JR.

LANCIA PASSING THE VANDERBILT ESTATE

HEATH ON SHARP TURN AT LAKEVILLE



VIEW OF THE CROWD AS IT PACKED THE COURSE AFTER LANCIA HAD FINISHED

avenue turn, when he had an adjustment to make. He received the announcement that he was second with calm imperturbability and had no comments to make on the race or on any of the drivers.

No. 15. LYTLE—Lytle was the favorite among the Americans, although his was a car added by the cup commission. Lytle had all manner of ill luck. His tires went wrong almost from the start, and he completed the hoodoo record by running into a large Newfoundland dog, whose corpse assisted in rendering the steering gear a wreck. Before this, Tattersoll had been thrown out of the machine and Lytle had attempted to proceed without a mechanic, which would have spelt disqualification for him if he had succeeded in doing it. Then he had chains which broke, and finally found himself helpless a long way from a control. He tried to call up the repair station on the telephone and lost 10 minutes in a vain effort to do so. Then he quit.

No. 16. CHEVROLET—Chevrolet was the third man to come to grief at the S turn. His car skidded into the same telegraph pole as that of Keene. It was on the sixth lap and the Frenchman had been doing well up to that point. His only stops had been for supplies and for one bursted tire at Lakeville. He, too, took the first turn of the Willis avenue serpentine at a fast gait. His car landed with a glancing blow against the fatal pole which already had a huge chunk torn out by the Keene Mercedes. Chevrolet, with admirable control, drove his car off the road and kept it right side up with care until he reached the center of a large field adjoining the course. Then he crawled from his seat and looked the damage over. He had nothing to say except that it was his own fault. The car had a bent axle and could not be steered at speed. The car had not been making the speed it should have done. Chevrolet was the only man at the start who seemed afraid of the work before him. He was painfully white about the lips and his hand shook perceptibly.

No. 18. HEMERY—Hemery won through good head work. The Darracq machines were not by any means the fastest in the race and needed attention because of the delicate mechanical construction. Hemery humored the machine constantly. He took no chances and he and Wagner were signalled to from the grand stand every time they passed us to how fast they were going and their position. It is also believed that there were other Darracq signal men stationed about the course, for Hemery knew every time he stopped for oil or gasoline just where he stood and what his chances were. He was very attentive and business-like at the starting line. He wore a dark sweater with the word "Darracq" embroidered on it, as did Wagner. Hemery made only perfunctory stops until the beginning of the sixth round, when he ran into the Dunlop control near Jericho and changed all four tires. The tires were not injured, but he was under orders to take no chances. The result proved the wisdom of the action. He had no tire trouble and no engine trouble to speak of. Hemery was very quiet over winning of cup. Friends vociferously crowded about and kissed him

VANDERBILT TO TATTERSOLL'S RESCUE

all over his smoke and oil-grimed face. He said the machine did it—not him. He said he had no fault to find with the course, but that with fewer turns and corners he would have made the Florio road race record look like 30 centimes. Then he grinned while the remark was translated.

No. 19. WHITE—Every one laughed as White started away when he received the word go from Wagner. Taking a lesson from experience in the eliminating trial, White started very gently and allowed the steamer to glide softly forward for 20 feet before he threw on pressure. This was so different from his brash start in the trials that the crowd laughed heartily. White drove in a gingerly way and had trouble from the first. His gears did not work and his tires burst and were punctured with heart-breaking inconsistency. Before he had gone 1 lap he was laid up for repairs at Bull's Head control. It took him more than 4 hours to make 4 laps and when he finally stopped it was because the cylinder head had broken. Even then he made an attempt to keep going. He tried to get Bull's Head control on the wire, but wasted 10 minutes in fruitless attempt. Then he borrowed a bicycle and began the stunt done by Robertson in the eliminating race. Before he had ridden 2 miles the chain of the bicycle broke and White was forced to give up. He said: "I guess the next thing to go will be my leg or neck, and suppose I'd better save that." He said the cylinder head repair was easy, if he could only have gotten the part. Tears stood in his eyes as he told of his hard luck.

No. 20. SARTORI—The veteran was very careful as he started. He drove better than he was ever known to drive on any American track or road. He got a great deal out of his car and was still running when the race stopped. He had made 8 laps. He had tire and wire troubles at various points and stopped on an average once each lap for tinkering. But on the eighth round the car was running better than ever and might have had a chance if early troubles could have been avoided. He was stoical over his defeat, but hoped for another chance at the cup.

SIDE LIGHTS ON THE RACE

America has demonstrated that it is getting there in the matter of building fast cars and that it is there with the goods in the matter of tires. Taking all things into consideration the American cars came out of the scrimmage with about as clean a record as did those of foreign make. Not a Mercedes car finished, though in fairness it must be said that Warden in this make of machine was still running when the race was stopped. Of the French cars Hemery's Darracq and Heath's Panhard came in first and second, Sisz' Renault was still running, but Duray's de Dietrich and Wagner's Darracq were out of it somewhere. Only Cedrino and Chevrolet in Fiats were put out, while the other Fiat drivers, Nazarri and Sartori were still running when the race was stopped, while Lancia had made his remarkable run into fourth place. Joe Tracy was the only American to finish, his Locomobile seeing him through without the least

Digitized by Google

trouble, while his Diamond tires carried him the entire distance without change, a record never before made save in the Florio cup race. The other American cars were put out from one cause or another, but, with the exception of Dingley's Pope-Toledo, whose cylinder cracked, there developed no structural weaknesses.

The Vanderbilt cup race will go down in history as the greatest road event up to and including the year 1906. It was the superior of any foreign event in so many points that is must be conceded that America has topped the heap. This is all the more apparent if attendance and enthusiasm is to be taken into consideration. The enthusiasm was so acute that were some of the members of the motorphobia press—even including writers on the Chicago Tribune and Inter Ocean—had been present they, too, would have been forced into the spirit of the occasion and would have become automobilists if they could have their individual ways about such matters. With the metropolis of the western hemisphere to draw from, to say nothing of the hundreds of towns and cities within a radius of a hundred miles, and the course but a matter of some 25 or 30 miles away, is it at all astonishing that there should have been a record crowd to see time annihilated? It is a safe estimate that a hundred thousand people saw the race from various points around the 28-mile circuit and if this is any indication of the interest in automobiling in this country then well may the motorphobia press pull in its horns and admit it is on the wrong side of the fence. A surging crowd extended in either direction from any point around the entire course. The people went on foot, in horse-drawn vehicles, in automobiles and on bicycles. It would appear as if everything with a motor had been lined up along the course; there must have been a good 5,000 machines of all ages and all descriptions somewhere on that 28-mile stretch.

There was as much difference between the drivers and their methods of handling their mounts as there is between as many jockeys. Smiling, good-natured Lancia created the most favorable impression from the start. His handling of a car was supreme, he was easily the king of them all, driving with an ease that betokened the master. Heath, American, calm, confident and steady. Not a waver was noticeable, not a hitch, not a move except recognition of his family in a box by the raising each lap of his right hand. Hemery, daring as Gabriel, handling with wonderful daring a car that bobbed around like a cork, caring for nothing but his desire to cover ground. Joe Tracy, careful, watchful and cautious, but driving with an intent to finish and make some pretense of upholding America's honor. Tracy was not looked upon as a favorite; he was not making an impression at first. It was after one by one of the foreigners or his team mates had been lost and he had kept on going, going, going, that he began to receive the attention of the crowd. Then this attention began to grow and he was told of it as he finished another and

THE TIMERS AT WORK

another lap and was nearing the end with bright prospects for a place in view. Sisz, another daredevil but seemingly lacking in ability to pilot his car quite as fast as others but driving splendidly. And Jenatzy, a favorite at the start and as long as he lasted, but unfortunate, as has been his record for the past two seasons. Walter White plainly showed his lack of experience in such a contest, but he started off with no intention of repeating his performance in the eliminating trial by breaking a universal joint or anything else by a too sudden opening of the throttle. His was the slowest of all the starts. Lancia, Hemery and Jenatzy tied for quick getaways.

Word comes by cable that the Automobile Club of France has recognized the suspension of Hemery for 1 year by the Italian racing authorities and disbarred him from racing in France during that period. The original suspension grew out of a row over a mix-up of the timing at the end of the Florio cup race, during which Hemery, in his excitement, was impertinent to the Italian race officials.

The Darracq racers ran on a schedule and system devised and directed by Mr. Rawlinson, an Englishman, who is said to be chief stockholder of the company. Hemery and Wagner were instructed not to exceed 26 minutes for the first 6 rounds, it being figured out that their reckless rivals would wreck their cars through excessive speed and that in the last 5 laps there would be ample opportunity to take to chance and make up lost ground. Rawlinson and an assistant sat in the grand stand and displayed cards indicating the time and position of the Darracq men and also warning them when to quicken or slacken their speed. It now turns out that in Thursday's practice two cylinders were cracked in Hemery's car and were replaced from an extra racer of the same pattern kept for just such an emergency.

Before the race was run it was freely predicted that there would be not only one but several fatalities, and as a result the future of road racing was then and there doomed—if accidents occurred. There was a good cause to believe this, for when those thundering locomotives of the road swept through the narrow lines of human beings it seemed as if nothing could stay the hand of fate and leave the race free from more than one sad tale. The death of one dog evidently did not count, for there were few who did not openly express the opinion that next year would see another race and over the same course. There is no danger that the Nassau county people will prevent a race, they reaped a bigger harvest on this race than they could gather in ordinary ways in twice several years. They will even go to the trouble to make long, easy turns and bank them at that. That's what some of the county officials say, anyway. Between justice court justice, prairie feather beds, ham and eggs and other things dished up to the visitors the Long Islander fared pretty well toward the right side of his ledger.

"To Hemery and France the race; to Lancia and Italy the glory" was the trite way the New York Herald told the story of the big contest, and no few words could have been selected and put together to give a better idea of the feeling of the entire crowd which witnessed America's second big road event and the equal of the contests which are run

LANCIA SURROUNDED BY AN IDIENSE MOB AT THE END OF THE RACE

Digitized by Google

tournament and agreed to buy his car besides. Keene is to compete and the White people are to send down their road and track racers.

It might have been impossible to afford better protection to not only the crowd but the contestants by keeping the course clear, but the officials declared it was beyond human power unless Uncle Sam had loaned his standing army to act in the capacity of a police force. It was not a fact that the road was kept clear of people and in this the Americans will doubtless receive some criticism by foreigners. Still, it must be remembered that there was not a spectator hurt, which is the best evidence that the affair was properly managed. The system of flagging was ideal and was probably responsible for the absence of any trouble to spectators and to contestants as well.

HEMERY'S CAR AFIRE

New York, Oct. 15—The law of compensation got in its deadly work on Hemery, winner of the Vanderbilt cup. As he was seated on the lawn at his quarters at the Glendale hotel, at Glen Head, today, surrounded by Duray, Wagner, Jenatzy and other friends, to say nothing of a gaping crowd of admiring rustics, flames suddenly leaped from the ground and enveloped the speedy Darracq, which had won for him the victory. The car had been taken from the stable and was being cleaned preparatory to being shipped back to France. There was much oil and gasoline on it and the ground, too, was soaked with these combustibles. A lighted match was thrown. A blaze started at once. All hands sprang to the rescue and fought the flames with sand and water to naught avail. The fuel had to burn itself out. The car, however, was not totally injured as there were only the tires and seat upholstery to burn. The car had not been sold, as was stated in the printed reports.

CAILLOIS TOO LATE

New York, Oct. 16—Caillois, who was second to Thery this year in the French trial, dropped in at the MOTOR AGE office this morning. The Savoie arrived too late Saturday for him to see the race. "I am delighted at the result of the race," said he. "Hemery and Heath, you know, were put on the French team to take the places of Thery and myself. I thought Hemery had a good chance, for his car is built right for such contests. It is light and not too highly powered. Lancia is the most wonderful automobile acrobat in the world.

"His daring is marvelous, but he is not a safe driver and is likely at any moment to lose through an accident. From the results of the race and what I am told I judge that you have a splendid course, though it is too narrow in places to be ideal. I think the length of the circuit is not a bit too short, but the length of the race is. It should be at least 400 miles to test the cars. In so short a race as 283 miles any car may have the luck to win. It is a sport all the way and the drivers take too great risks. I cannot say whether the Bennett race will be run next year; but it is nonsense to talk of making it a race for touring cars. How could you fairly match cars of different powers? Are you going to have any more track races? I like them. They are full of interest for the spectator, but they are very dangerous to the drivers. I wanted to race in the Vanderbilt this year, but my firm would not let me. Perhaps there will be a race here next year and then I hope to be on hand. Thery, though, is through with racing for good. I am not ready to quit myself, for I like the game, and besides I have not yet accumulated the fortune my team mate has on the road."

BANQUETTED THE FORLIGNERS

New York, Oct. 17—The foreign drivers were conspicuous chiefly by their absence at the smoker and reception tendered them tonight at the A. C. A. Barney alone was present. Tracy, of the American team, however, was on hand, as was also Caillois, the runner up to Thery in the French trial. Nazarri and Lancia had gone to Niagara Falls and the others were probably sight seeing or in arranging for the shipment of their cars. The rooms, however, were crowded with members and others. President Morris made a neat little speech congratulating France and prophesying that Uncle Sam, in view of Tracy's success, would lift the cup back next year.

It is probable that most of the foreigners will depart by the Thursday and Saturday steamers unless they can be persuaded to stay over for a race meet that is being arranged for them on Atlantic City beach on Friday and Saturday of next week.

A banquet has been arranged by Senator Morgan in honor of the visitors, which will occur at the New York Press Club tomorrow night.

AFTER THE RACE THOUSANDS OF PEOPLE CROWDED THE ROAD, PREVENTING AUTOMOBILES FROM LEAVING THE PARKING SPACES

WHAT THE BIG RACE INDICATES

AMERICA can well feel proud of its record in the Vanderbilt cup race, a record which few, even the most patriotic, believed it capable of making—that one of its cars finished better than fifth was more than most people expected. It was long ago conceded that either France or Italy would carry off the honors, Germany having lost prestige in contests of this sort.

This year's contest had much more of the international flavor than did the first Vanderbilt cup race, notwithstanding the presence then of some of the foreign drivers, who, however, bore no such reputations as speed merchants as did those who came across the ocean this year to try conclusions with the Americans. The success of two American cars last year could not be accounted as a victory from a speed point of view, for those cars did not show remarkable speed. This year, however, an American car finished third in the choicest field ever seen and not only made a record in this respect, but went through the contest without so much as stopping to inflate tires, much less replace parts and tires. It was a tire victory as well as a car victory; it was a tire victory which has only once been equalled, and that in the Florio cup race. It was also a victory for an American driver, whom the foreigners did not fear before the race, but whom they must take into consideration in the future international long distance road contests.

America need not by any means feel at all discouraged at the outcome of this event simply because but one of its cars finished. That one car finishing third in such a field of starters is sufficient glory to warrant it in throwing up its hat and shouting. America can now see what it must do to win such a contest; to hold its own with those countries which have had many years of experience in building racing cars and in operating them. America can easily see that she is gaining in experience in building good cars, cars that will withstand the terrific strain to which they are put in such a contest.

It has been a long, discouraging fight to get near the clearing. Perhaps we should whistle softly, but we can whistle a little, just the same. Whistling always encourages—it seems to drive away fear. Let the American maker whistle softly, but let him keep on building cars and making the gains he has been making and the world will hear of not only one American car finishing but of several doing likewise.

Tracy's driving in the Vanderbilt cup race was such as to show that an American can do what any other man can do; the conduct of his car was such as to show that an American car can be made the equal of any on earth, and further it was demonstrated that American tires can be and are being made to not only hold their own against the world but to put up a record which will withstand a lot of continuous beating.

America has been a little slow in this road racing game. She has been slow to profit by mistakes, but she has finally come around to a sensible way of reasoning and is now on that road which must eventually lead to the top of the hill. It may take a little more time, but it will come, nevertheless.

France is to be congratulated upon its success, but at the same time it must realize that its southern neighbor, much younger in the field of automobile racing and automobile manufacturing, is leading it this very day in propositions involving speed in automobiles. Hemery drove an excellent race, he is entitled to all credit; but, barring an accident, which was no fault of the car, Lancia was as sure a winner as ever was known. The race was Lancia's from the start—in the language of the street, "there was nothing to it."

The race itself was a well conducted affair on the whole—far better than most people had expected. It was devoid of accidents of any moment to contestants and not a spectator was so much as frightened. Those who advocated the abandonment of road racing have had what little wind was left taken out of their sails. Road racing has been shown to be as safe and safer than boulevard riding. It stands in the same light as the 18-hour train—the road is so well guarded that accidents are almost impossibilities. In all forms of sport there is some element of danger, but with the care that was exercised in the conduct of the Vanderbilt cup race road racing dangers have been minimized, and, in short, eliminated.

Next year will probably see another event of a similar nature and not unlikely over the same course. The result of the race of Saturday was so encouraging to American makers that a number have already promised to go into the manufacture of racing machines for the purpose of showing to the world that they can and will make cars equal to those of foreign construction in point of speed and lasting qualities. The American has heretofore been discouraged; now he is hopeful and will begin turning out a racing car, all the time keeping up his tuneful little whistle, softly though it be. He can afford to whistle softly, but at the same time he will be whistling with more confidence than he has ever dared to pucker his lips before.

The people want a reasonable amount of road racing—road racing of quality, such as the Vanderbilt affair. The attendance at this race indicates the growing interest in a contest teeming with interest and excitement, but at the same time practically devoid of danger when plans are carefully laid and carried out to avoid danger. The mistakes of last year were easily seen and rectified; those of this year have been noted, so that another year even the few accidents to the contestants and their mounts may be avoided and the entire field of starters may be in a condition to finish and thus give the American people a sport full of excitement and at the same time prove of benefit to the maker in the matter of automobile designing and construction.

WHY THIS EFFORT FOR GOOD ROADS?

DOES the great American public want good roads? Does the automobilist, the cyclist, the user of horse-drawn vehicles, the merchant and the farmer want good roads? There has been nothing of a startling nature within the past decade to warrant the belief that good roads are necessary or desired by any but a few enthusiasts, who are rapidly becoming reconciled to the fact that the lack of interest in this most important proposition indicates no desire for improved roads.

The automobiling organizations and the farmers have done nothing worthy of note toward securing better highways; the farmer is adamant; the merchant does not care—all blind to their own interests and their own comforts and pleasures.

The newspapers have been called upon in the past to give the good roads movement support. They have responded to the call generously. It has all been in vain. The little boom that the project had a few years ago died with cycling and has been under ground ever since.

Let it stay there! What is the use of a few worrying out good gray matter for others when others will not turn in and so much as sign a petition to have a bill passed? Why should automobilists and farmers and merchants receive a benefit that is all to them when they take so little interest in a proposition?

It were better that all efforts be laid aside until all classes realize the necessity of improved highways, as they will before many years shall have passed.

A policy which is either unfriendly to or directly against highway improvement is not only a short sighted one, but indicates antediluvian tendencies. Look out for the man who does not favor good roads, be he farmer, merchant automobilist or politician, and particularly keep an eye on the politician, whose judgment may be easily warped.

Jump Sparks

Glidden is about to go glidin' again.

Fur suits and anti-freezing compounds will begin to feel rather comfortable in a short time.

Motordom will now stretch its arms, yawn a bit, talk good roads and wait for the shows and the Florida beach meets to break the ennui.

America hasn't lost the Vanderbilt cup yet. It is true France has it, but France is under a bond to run a race for it or to turn it back, so all is not lost.

Now that the Vanderbilt cup race is over, the tourists and the other plain automobilists will come in for an inning. After that the shows and the "entire product sold."

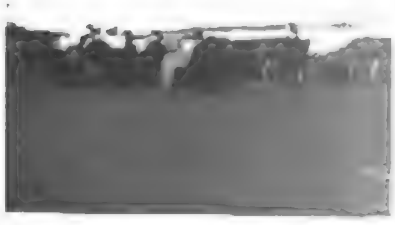
Those who won places in the American eliminating trials and were thrown out will have a beautiful chance to do a lot of sneering at the cup commission the way the Vanderbilt cup race turned out.

A little girl met death in Chicago by being dragged by an automobile, upon which she was hitching. But the automobile received its full share of blame by the Chicago Motorphobia Press Association, just the same.

The crowd at the Vanderbilt cup race was provided with a band, just what for is not known, for while the band was playing to beat itself the contestants in the race were also going to beat the band, as the times made indicate.

It was an obliging act on the part of the Automobile Club of America to furnish a refreshment tent for the women at the Vanderbilt cup race, but what the man who walked wants to know is why were so many men hanging around this particular spot on the grounds?

Out in San Francisco a wholesale grocer had discovered that the automobile has increased the sale of chewing gum 25 per cent. Motorists have been known to chew the rag, but that they should boost the profits of Messrs. Yucatan, Tutti-Frutti, Tolu & Co. to such an extent was never suspected.



Beating the Band on Long Island

Even if the weather man did receive a cussing last spring at the tongues of the American motorists, he has of late been dishing out weather good enough to more than take off all the cuss.

At last a ray of light has penetrated the Cimmerian darkness! On Friday last Adam Newhart, a Bethlehem township farmer, was actually fined $13 by Magistrate Brunner, of Easton, Pa., for refusing to draw his team to one side and allow Clement F. Hill, an eastern automobilist, to pass by!

The Week

France lifts Vanderbilt cup, with America second, Italy third and Germany nowhere; Hemery is winning driver, Heath being runner up; accident robs Lancia of almost certain victory.

Italy makes bid for British trade by opening a Fiat branch in London; radical changes being made in English trading system.

Clifford-Earp, in English Napier, wins Chateau Thierry hill climb in France, average speed being 58 miles an hour; he also captures honors at Dourdan meeting.

Dewar cup event, set for Wednesday, abandoned because of accidents to cars entered.

New York legislature's joint committee starts on 1,000-mile road investigating jaunt.

England reports motor boat racing received setback as result of season's schedule.

Aero Club of America formed in New York to advance science of aeronautics.

Foreign drivers who competed in Vanderbilt race return home this week.

New Jersey experiments with coal tar to make dustless highways.

France has definitely settled that she will have her tire race next year. In the language of the pun-maker, she has retired from the Bennett-Vanderbilt competitions and it will take at least 3 or 4 more years for her to tire of the new fad.

A police officer at Cleveland, O., doesn't believe automobiles are so dangerous as most people do. "We investigate every accident and have found every one to be due to the carelessness of the pedestrians," he is reported as saying. That man stands a good chance to become as famous as the tire-shooting cop of a Chicago suburb—the other way.

Judging by the decidedly yellow tinge given automobile accidents in the Chicago Inter Ocean, there is a difference of opinion between the news editor who knocks the game in the front part of the paper and the man who writes the trade jollies in the pink sheet and solicits advertisements from the makers and retailers on the strength of his soft soap.

Chairman Morrell did a pretty good job at running a race, even if he didn't do a good one in selecting a team.

"To France the cup, to Italy the glory," says the New York Herald. That's the time the hammer whacked the nail on the right spot.

Chicago is still on the automobile map despite the fact she has had no holdups, no bump the bumps or any other eruptions of that sort for at least a month.

No contest was held this week for the Dewar trophy. Only three entries were made. Evidently the people prefer the cup that cheers but does not inebriate.

England is coming to the front again, Clifford Earp having gone over to France and grabbed off a hill climb, just by way of showing France that the little island is not dead.

Motor Age is going to credit Senator Morgan with finding more beach tracks. The senator says Motor Age is at the top of the head of the automobile papers, and this is worth some return.

If a man were to run in front of a locomotive, would the locomotive be blamed for the man's death? How long will it be before the press and the public learn that it is dangerous to run in front of an automobile?

In the Chateau Thierry hill climb Earp, the Englishman, traveled toward heaven at the rate of 58 miles an hour. This is even a faster pace than the most rabid motorphobist in motorphobia-infested Chicago would have the automobile owner travel the other way.

The village of Glencoe, Ill., made famous by placing bumps in the road to prevent scorching, is becoming converted. It proposes to raise the speed limit to 15 miles an hour, but it doesn't show why a fraction over 8 miles an hour was a dangerous speed heretofore and 15 miles a safe speed now. Still, automobilists ought to grin with pleasure at the new turn of affairs and hurrah for Glencoe. They might suggest that other places put in bumps if it will have unreasonable speed limits raised.

"Ladies" Refreshment Tent at the Race

EARP BEST IN CLIMB

Englishman, Driving Napier, Goes Up Chateau Thierry Hill at 58.5 Miles an Hour Clip

Paris, Oct. 2—The feature of this year's Chateau Thierry hill-climbing contest was the victory of W. Clifford-Earp on a six-cylinder 100-horsepower Napier. He climbed the kilometer on a 10 per cent grade, with a standing start, in 38⅛ seconds, or at an average speed of 58.5 miles an hour. This performance lowered Rigoly's record, in a Gobron-Brillié, by exactly 7 seconds.

Clifford-Earp's racer is one that ran for England in this year's Bennett race, securing ninth position. He brought it over to France a few days ago, coming down from Havre under his own power and to compete in the two or three races in which he is entered. Stead, on a Mercedes, also marked a faster time than last year's record, climbing the hill in 39⅖ seconds. Faure, with the same make of machine, was slower, taking 46⅕ seconds in covering the kilometer. Pieorn, with a 1903 Mors racer, took 53⅗ seconds, and the Automoto, driven by Lapertot, did not get up in less than 1 minute 7⅘ seconds. Baron de Caters had entered his new Mercedes racer for the hill-climb and was duly started, but abandoned the test before he had covered more than a few yards, owing to his carbureter firing.

Hauriot, in a light Darracq car, entered in the 1,430-pound class, covered the kilometer in 41⅘ seconds, being nearly 9 seconds faster than last year's time; while De la Touloubre, also in a Darracq, weighing less than 880 pounds, climbed the hill in 53⅗ seconds.

The Chateau Thierry event is a brilliant example of the progress made in motoring. In previous years the racing events were run over the mile course, which necessitated the tackling of a rather difficult bend just beyond the kilometer line. With the increased speeds realized by both racers and tourists it was found that this turn, quite safe 2 years ago, was now dangerous, to send the racers and fast touring cars round this bend, and the climb was consequently stopped at the kilometer line for the big cars, although the slower vehicles were allowed to go the full mile up the hill because they could be slowed up before actual danger threatened at the bend.

Touring cars had seven classes provided for them, according to selling price, with one class for touring tri-cars, a motorcycle third of litre class, and competition for trucks. The $800 to $1,600 class and the less than $800 class were run over the mile course, both being won by Boyer cars in 3 minutes 25⅗ seconds and 5 minutes 30⅘ seconds, respectively, which the other events were all run over the kilometer. The fastest time for the kilometer, standing start, was 55⅖ seconds, accomplished by a Panhard touring car with four persons on board, in the $5,000 class. In the $3,600 to $5,000 class a Radia accomplished the climb in 1 minute 4⅗ seconds, being the second fastest time. A Fiat car in the $3,000 to $3,600 class took 1 minute 7⅕ seconds to climb the hill; a Svell 1 minute 40⅘ seconds in the $2,400 to $3,000 class, and a Serpollet 1 minute 13⅕ seconds in the $1,600 to $2,400 class.

General View of Chateau Thierry

Clifford-Earp and His Napier

ON PLAINS OF IDAHO

Tourist Megargel Passes Through Rabbit-Infested Land and Is Lost in Snow Storm

Arco, Idaho, Oct. 11—With the skins of two coyotes, killed on the lava desert, tacked on the sides of the car, the Reo Mountaineer, of New York, pulled into Arco late last night, having successfully withstood the hardships of the 65-mile desert run, without taking on water or getting stuck in the sand hills. The lava plains of Idaho, just covered by the Reo Mountaineer, extend from the Mormon settlement of Moreland, in Bingham county, to the village of Arco, in Blaine county, and are inhabited only by wild beasts, mountain lions, coyotes, wolves, bear, antelope, deer, wild cattle and wild mustangs. Three land-marks in the center of the barren plains are visible for 100 miles. These are three huge piles of earth and lava rocks known as the three buttes—Big Butte, Middle Butte and Little Butte. The trail to Arco runs between Big Butte and Middle Butte and a trail between Middle Butte and Little Butte takes one up the Lost river region, a section of country that abounds in mystery, chief among which is the total disappearance of a large river, which, after running several hundred miles, sinks into the ground and disappears entirely.

At Moreland, where the American Motor League tourists put up, the entire country is suffering from the jack-rabbit plague—a plague that any one of the plagues of Egypt would have been small besides, according to the stories of the Mormons settled there. No sooner is anything planted then the jack-rabbits eat it up. Fences are sunk into the ground to a depth of 3 feet, but the rabbits burrow under them. Dogs are kept in small herds to hunt them down the the country for miles around is strewn with pieces of rabbit fur, but for every one that is killed a dozen spring up to take its place. Regularly organized rabbit drives are held weekly and thousands—yes, tens of thousands—are killed in these drives, but still they increase.

When the Reo Mountaineer came into sight there were rabbits in front of us, rabbits to the right of us, and rabbits to the left of us, scampering in every direction at the approach of the puffing car. Even the dreaded coyote is allowed to roam free over this section, as he lives on rabbit as much as he does on sheep and, as one farmer we passed him on the road during our journey yesterday afternoon expressed it, "every little helps."

We had several invitations to participate in rabbit drives, the farmers even

Digitized by Google

talking of purchasing an automobile and taking off the muffler as a rabbit driver. We spent the night with a Mormon family on the outskirts of the great lava plain. Although the family was one that would have caused President Roosevelt to have thought twice before he expressed his now famous views on race suicide, we were given the best of everything and a bunch of youngsters turned out of bed to make room for us.

Sunday we lost ourselves. It was not entirely our fault, for we were misdirected and not coming to a ranch for some 15 miles, naturally kept on going wrong. When we finally came to an Indian encampment we had difficulty in making ourselves understood, for neither Fassett nor myself are very much up in Bannock Indian talk. Finally we were informed that we could reach Blackfoot by striking off across country and we attempted it, first running north to avoid a butte and then turning south to avoid a rocky mountain peak. We kept turning first one way and then another, fording stream after stream and eventually running into an Idaho snowstorm that stung our faces like needles. By this time we realized that we were lost—hopelessly lost and there was neither ranch nor man within 15 or 20 miles of us. One thing remained, however, and that was to follow our own trail back to Pocatello. This was finally accomplished, we arriving there guided by our searchlight, a little before midnight, having put in the hardest kind of a day and having accomplished nothing.

Arco is a little settlement in the midst of the lava hills, boasting of a store, three saloons, a water tank, pool room and hotel. The latter, strange to say, is well kept and we really enjoyed clean sheets and two good meals, the Jap cook certainly knowing his business.

Gasoline in this section of the world comes in 5-gallon tin cans, sealed. The price ranges from 35 to 60 cents a gallon, according to the greediness of the particular store keeper you purchase from. Gasoline, however, we must have, no matter what the cost, and the store keeper, knowing this, puts his price accordingly. We have arranged a couple of iron loops on one of the side steps of the Reo Mountaineer, on which we carry two 5-gallon cans in addition to the 10 gallons the main tank carries. With this amount of fuel we feel comparatively safe for a 200-mile mountain trip, or a 300-mile run across level country—a species of country unknown in Wyoming, Idaho or Oregon, where our little caravan has all sorts of wild adventures in its search for the best route between New York and San Francisco. While we are enjoying these incidents will welcome civilization again.—PERCY F. MEGARGEL.

MEGARGEL'S ARRIVAL AT THE LITTLE TOWN OF ARCO

FRENCH CARD MADE UP

Race for Tires and Monster Tour of Europe Planned for 1906 By the Automobile Club

Paris, Oct. 5—Three decisions only have been arrived at by the committee of the Automobile Club of France united to consider the program for 1906. France will not compete for the Vanderbilt cup next year, whether it wins or loses this month. A tire competition will be held next year, and a monster touring event of over 3,000 miles through the various countries of Europe will also be organized. No decision was arrived at regarding road racing; indeed the matter was not even discussed and no one can yet say whether an important road race will be run or whether France will abstain entirely from such events, according to her announcement.

The tire competition has been under discussion unofficially for some time. In this novel event it will not be cars that will be entered, but a set of tires or wheels, the competitor making his wheels travel by means of any motor he likes, with, of course, reserves as to weight, and having full liberty to change anything or everything apart fro mthe tires. It is, in fact, an inversion of present methods of road racing, the tire manufacturer choosing his car instead of the automobile constructor selecting his make of tires. An equal number of tires will be allowed each competitor, repairs may be executed by the usual equipment carried on board, but all the tires stamped at the beginning of the race must be presented at the end of the run. It is probable that the event will consist of two daily runs of 500 kilometers each, the complete set of tires arriving first winning the tire competition. The French tire manufacturers all declare that the competition will be one very difficult to organize. Quite apart from the length of life of a tire according to the way in which the car is driven, there is the question of cars of different weights and different builds which will all influence the final result. They also want to know whether a car coming in first on the rim will be placed before a car arriving later with its tires still in good order.

The great touring event has been

A MEGARGEL EXPERIENCE IN IDAHO

brought forward by the Marquis de Dion, vice-president of the club and head of the firm of De Dion, Bouton & Co. The marquis has little love for road racing, but he is wildly enthusiastic on touring and industrial vehicle competitions. It is his opinion that existing touring tests are not of a sufficiently exacting nature. Any car can cover a distance of 600 miles, but the automobile that will run from Paris through France, Italy, Austria, Germany, Belgium and back home will indeed be worthy the name of a touring car. Preparation on a gigantic scale will be necessary to make such a tour successful, but when once the Automobile Club of France has pledged itself to organize any event it is not deterred by any surmountable difficulties and will push through to success, for the makers here want to show the world that they can duplicate their successes in the Bennett race when it comes down to touring. If they can draw under their banner motorists from all sections of the globe will rest content.

FIAT FINDS FOOTING

Italian House Founds British Company—Radical Changes in English Trading System

London, Oct. 7—The process of preparing in grim earnest for the expected struggle for the English market is developing with something like rapidity. The Fiat concern, of Turin, has formally founded a British company with headquarters in Long Acre, London, to handle and market these cars only. The French firms of Brouhot, Chenard-Walcker, Gobron-Brillie and Mors have also taken this step, while Panhard & Levassor, Clement, Gladiator, Mercedes, Richard-Brazier and Peugeot already have had their sole agents in England, most of these controlling the trade for the British colonies also. On the other hand, British firms are also endeavoring to employ retailers who can have no other interests to push. The day is fast passing when one retail firm can offer its customers any one of a dozen or so leading makes—from the catalogue. Customers now want to see the actual car they are asked to purchase, or a duplicate, and as some of these are costly and not free selling, the stock necessary to handle more than a couple of agencies is more than most firms can lock up in this manner.

Another tradition which is passing away is the necessity to put down one-third of the purchase money with the order and then wait 3, 4 or 6 months for delivery. That was originally instituted by the French manufacturer as "earnest money" to be forfeited if the bargain remained uncompleted. Then it developed into being an insurance of delivery in turn, but now it is being kicked against, and so British firms are able to accept the orders of their customers without stipulating for any deposit it is certain that the French trade will in the end also lose this form of capitalization. It has been stated that about a year or so ago £3,000,000 of the customers' money was lying in the banking accounts of a few of the leading automobile firms as deposits on cars, many of which could not be delivered under from 6 to 7 months. Of course, reforms of this nature are not being effected without a struggle, but the advent on the scene, and his importance to the trade, of the man of strictly moderate means has had its effect. The motor trade now requires more capital than ever to run it and infinitely more sound commercial management than it has, with but few exceptions, received.

One matter upon which firms of standing have long taken a firm position and which has helped to build up the trade of less scrupulous concerns has been the system of blackmail by chauffeurs which we imported from France among our automobile manners and customs. It is customary for many firms to give the wideawake, i. e., dishonest, driver a commission on all the business he brings these firms, consequently he is keenly on the lookout to divert trade from firms that do not subsidize him in this way to firms which do. The firms which make this business policy, of course, recoup themselves out of the proprietors of the cars, often with heavy profit, sometimes by transactions which would not stand legal investigation. The evil is a great one, not so much from its cost as because it leads up to baseless dissatisfactions with honest traders and the glossing over of real faults—all making for the hindrance of automobilism. Like the social evil, it is perfectly understood but seldom alluded to. The Argyll company, of Glasgow, however, has taken the bull by the horns in the matter on opening a new and extensive depot for its cars in the west end of London, which is being run by a separate company formed to exploit the Argyll car only. In large and flaring advertisements they announce that under no circumstances will a tip be given to a chauffeur, but no doubt in order to maintain his good will they propose to give a prize of £5 and a certificate to every driver who runs an Argyll car, purchased from this subsidiary concern, for 5,000 miles at an inclusive cost for gasoline, oil, grease, tires and car repairs rising from £42 for a 10-12-horsepower car up to £62 for a 24-30-horsepower vehicle. This is not a bad idea, as it seems to fix a standard of economy which will keep the chauffeur's wits alert to maintain and which is low enough to entice purchasers to the Argyll depot. But it is no cure. The dishonest driver will not worry over a £5 note for 2 or 3 months' work when he can get as much from his pet retailer for the simple asking. To the honest chauffeur it will be an incentive, however, for the certificate alone will be of great assistance to him in obtaining fresh employment in his profession.

ROAD INVESTIGATING JAUNT

New York, Oct. 17—A thousand-mile journey by the joint committee on good roads of the New York legislature will begin at 8 o'clock this morning, starting from the Murray Hill hotel, with the first day's run terminating probably at Lenox, Mass. Senator W. W. Armstrong is the chairman of the committee, but he will not be able to join the party until the latter part of the week. The tourists include Senators Allds, Malby, Warnick, Keenan and Grady and Assemblymen Hooker, Merritt, Moreland and Cook. State Engineer Van Alstyne will also be included in the party, which at Worcester will be met by W. E. McClintock, chairman of the Massachusetts state highway commission, while later in the journey at Hartford State Highway Commissioner MacDonald, of Connecticut, will be another addition. Chairman Morrell, of the American Automobile Association racing board, who is an enthusiastic tourist, will be the pathfinder of the expedition, and will drive his Locomobile. A. W. Church with a Decauville, Walter White with a White steamer and Robert E. Fulton with a Pope-Toledo, will be the other pilots.

DEWAR EVENT POSTPONED

New York, Oct. 17—Senator Morgan has had to abandon the proposed running of the race for the Dewar cup at present. It was set for tomorrow morning in the Coney Island boulevard. The Ford had broken a shaft in practice, and Keene, Christie and several of the foreign cars had been put out of commission by Vanderbilt cup race accidents.

COAL TAR FOR ROADS

Experiments with French Methods of Making Dustless Highways Are Held in New Jersey

Washington, D. C., Oct. 14—Coal tar for use in highway construction in the United States is being brought to the attention of the good roads advocates of this country, it being claimed that a road treated with the tar is dustless, noiseless, will not side wash, will resist wear and always presents a smooth, uniform surface. France has been using the tar for several years in the construction of her highways and since the attention of Americans has been called to the fine points of this tar road makers' experiments have been made in this country which so far have been reported satisfactory. It was the Hon. Robert P. Skinner, United States consul general at Marseilles, France, who called the attention of the government to this use of coal tar through the medium of a special report, which has been published by the department of commerce and labor in the daily consular reports, No. 2073 issued by the government.

In this report Mr. Skinner describes the methods used by Road Commissioner Girardeau, of Fontenay-le-Comte, who has written a complete pamphlet on the subject containing much that is of pertinent interest to those interested in good roads and the suppression of germ-carrying, comfort-destroying dust that is so prevalent on the majority of even the best highways in America. Mr. Girardeau states that he was prompted to experiment with coal tar on road surfaces, through frequently noticing that where tar had been accidentally spilled on the road it left inextinguishable black stains. The road was preserved longer in these spots than anywhere else and the black stains soon appeared in relief. The first experiment made was in July, 1896, on the road from Sucon to Aiguillon-sur-Mer. The tar was spread on cold and covered with dust of the road. The result was decisive. Two years after this experiment the tarred part was 2 centimeters higher than the balance of the road. This much frequented road is flat, covered with a quartzitic material, and established on clay. The success of this experiment led to a number of others, all of which were eminently satisfactory. Since 1898 it has been recognized as advantageous to use hot tar.

Two notable examples of the use of coal tar on American roads are cited by good roads advocates. The first test was made on a section of macadam road at Westfield, N. J., in September, 1903, and the other at Montclair, N. J., just a year ago. The French system was used at Westfield, the only variation being that fine screenings were spread on the surface after tarring instead of a sand, as is used abroad. Owing to the lateness of the season the conditions were unfavorable. The road operated on had not been refilled for several years, and was given but a superficial sweeping before being treated. An examination of this road a year later showed that the treatment was satisfactory, it is claimed. The center of the road, on which fairly clean screenings had been used on top of the tar, was in per-

Digitized by Google

feet condition, the surface being as hard as the ordinary concrete tarred walk and as smooth as a floor. On the side of the road there had been some wear and a consequent accumulation of dust. It was held that this road should be treated at once and repeated every 2 years after, only using half the amount of tar as in the first two operations at the outset.

The experiment at Montclair was conducted by Malcolm H. Smith, superintendent of road and sewers, 1,000 feet of macadam road being treated with the tar. It was not until the last 500 feet were reached that the operation could be conducted in a regular manner so that a basis for an estimate on labor, tar and stone could be made. This demonstrated that the road could be treated with tar at a cost of 18 cents per lineal foot, 16 feet wide, the various items being as follows: Material, nine barrels of coal tar, $45; four loads, 7 yards dust, at $1.90, $13.30; labor, 2 days, for tar, $8; labor, 5½ days, men at $1.50, $8.25; labor, 2 days, foreman, $5; labor, 2 days, 10-ton steam roller, at $5, $10; total, $89.55.

One of the great difficulties that had been experienced there outside of the dust was the washing of the roads, owing largely to the steep grades on many of the streets. It was largely to overcome this, as well as lessen the regular wear and tear that this experiment was made. At the time this work was first inspected, about 600 feet had been completed, which took between 13 and 14 barrels of tar.

PURDUE TO TEST POWER

Lafayette, Ind., Oct. 16—The new automobile testing plant in the mechanical engineering department of Purdue university is now nearing completion, and within a few weeks the experiments will begin. The object of the new department of experimental engineering is to test for the consumption of fuel, horsepower delivered at the wheels and general efficiency of the machines under examination. The automobiles which will be delivered in running order at the university will be mounted on a stationary platform with the rear or driving wheels on a truck which is stationary in one sense, but which revolves with the wheels of the motor car. To this truck is attached a dynamometer for measuring the power developed and a brake horsepower device, which measures the net power output or power delivered to the truck. This, with the amount of fuel consumed in a given time, will give the general efficiency of the machine. The work of erecting and equipping the department is under the supervision of O. C. Klipsch, who was formerly with the General Electric Co. He succeeds Professor McColl. The automobile testing plant will eventually be turned over to seniors in the school for mechanical engineering, who will conduct these tests for their thesis work. They will test the various makes of steam and electric motor cars, and in testing the electric cars they will have the co-operation of the electrical engineering department. Automobiles for testing have been promised by the leading manufacturers in the country. When the plant is completed it will be in charge of Professor C. A. Young, O. C. Klipsch and W. O. Teague, all experienced men.

EARP IS AGAIN STAR

Englishman and Napier Capture Honors at Dourdan—Cissac is Motor Cycle Hero

Paris, Oct. 9—Dourdan, although not now one of the most important of French meetings, is still an official circuit, recognized by the Automobile Club of France. Faster times are done elsewhere, and despite its officialism, Dourdan will probably in future have to give way to more rapid tracks. Yesterday's races resulted in a victory for Clifford-Earp in the six-cylinder Napier car, the Peugeot doing well in the motor cycle class, and the Darracq in the light car class.

Earp did the standing mile in the heavy car class in 53 4-5 seconds and the standing kilometer in 25 3-5 seconds. His nearest competitor was Faure in a Mercedes, who did the mile in 1 minute 8 4-5 seconds and the kilometer in 34 3-5 seconds.

Hanriot romped away with the event for light cars weighing from 880 to 1,430 pounds, doing 1 minute 3 2-5 seconds and 29 2-5 seconds for the mile and kilometer respectively. De la Touloubre, in a Darracq, won the race for light cars weighing from 550 to 880 pounds, his mile being done in 1 minute 13 1-5 seconds and the kilometer in 38 1-5 seconds.

In the competition for motor cycles weighing from 110 to 550 pounds Guippone, on a Peugeot, won with 57 seconds for the mile and 28 seconds for the kilometer. Buchet, on an Anzani, was second in 1 minute 8 4-5 seconds and 34 2-5 seconds, and Chauret, on an Aleyon, third in 1 minute 36 4-5 seconds. Cissac, on a Peugeot, did the flying mile in 53 1-5 seconds and the flying kilometer in 27 3-5 seconds in the class for motor cycles weighing less than 110 pounds. Champoiseau, on a Peugeot, was second in 59 seconds and 28 4-5 seconds; Guippone, Peugeot, third in 1 minute 1 1-5 seconds and 28 4-5 seconds, and Anzain, on a Buchet, fourth in 1 minute 10 2-5 seconds and 34 1-5 seconds.

It is interesting to note that the time of the six-cylinder Napier for the flying kilometer is exactly that of the two-cylinder Peugeot motor cycle ridden by Cissac at the Blackpool, England, meeting a short time ago, namely 25 3-5 seconds. Yesterday Cissac rode the motor cycle on which he established his world's record at Blackpool.

Tourists were provided for in nine classes. The Peugeot, with Guippone as rider, again won in the motor cycle class. A Berliet car, with Bablot as chauffeur, was the fastest of all the four-seated cars, covering the standing mile in 1 minute 12 seconds and the flying kilometer in 35 4-5 seconds.

NOW FOR HIGHER SPORT

New York, Oct. 16—The Aero Club of America was formed at the A. C. A. tonight and the following officers elected: President, Captain Homer W. Hedge; first vice-president, John F. O'Rourke; second vice-president, Charles J. Glidden; treasurer, Augustus Post; secretary, S. M. Butler.

The club was formed to advance the development of "the science of aeronautics and kindred sciences and to encourage all kinds of aerial navigation, conferences, congresses and races," to quote Captain Hedge. The club has already been officially recognized by the Aero Club of France and the Aero Club of the United Kingdom. Negotiations are now under way to secure recognition by the Aero Club of Germany and similar bodies in other foreign countries.

Courtland Field Bishop has been appointed the representatives of the Aero Club of America at the International Congress of Aeronauts, which is now in session in Paris. The club already has nearly the full complement of founder members. Among those who enrolled last night were:

Dave H. Morris, Charles J. Glidden, John F. O'Rourke, John F. Carroll, Samuel T. Davis, Jr., Thomas L. Watson, Robert Lee Morrell, Cortland F. Bishop, Augustus Post, Homer W. Hodge, S. M. Butler, A. G. Batchelder, Robert Scott, A. L. Riker, Alan R. Hawley, Norman F. Cuntz, William Hawley, Emerson Brooks, C. T. Adams, Harry J. Everall, Orrel A. Parker, George P. Butler, William H. Butler and A. H. Whiting. Most of them are prominent motorists.

SIDDELEY IN THE SADDLE

London, Oct. 4—The fusion of the Wolseley and Siddeley automobile companies has been accompanied by the resignation of the general manager of the former and the sole control of the management is now in the hands of J. D. Siddeley, who is a Dunlop Tire Co. man who was early in the automobile field and had the good fortune to enlist the support of one of the Rothschilds, who had become an ardent motorist. Mr. Siddeley's commercial success was primarily due to the fact that he induced the Wolseley company to build his cars after his own idea. The company had gained a high reputation for reliability in public competition and in the hands of private individuals. But their cars were fitted with horizontal engines, and Mr. Siddeley's astuteness arose from the fact that he induced the Wolseley firm to build him a vertical-engined Wolseley, which not only sold and went well, but commanded better prices than the Wolseley cars. His success was so apparent that after 8 years' trading Vickars Sons & Maxim, who own the Wolseley company, bought in the venture and trade under both names.

CHIEF KNOWS WANTS

Washington, D. C., Oct. 12—The house warming and smoker of the new Automobile Club of Washington at the Villa Flora club on the evening of October 9 brought together the largest bunch of automobilists the capital city has ever seen. More than 100 cars were parked on the lawn. Major Sylvester, chief of police, who was one of the speakers at the banquet, made a hit with the crowd when he suggested in the course of his remarks that all vehicles should be marked with a number and carry lights at night, the same as automobiles. The police regulations will no doubt be shortly amended to so include all vehicles in these particulars. Judge Kimball pointed out where many automobilists unwittingly violate the regulations.

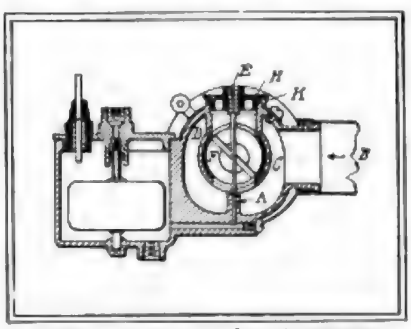
A New Reo Model

AUTOMOBILE DEVELOPMENT

THE REO 8-horsepower runabout for 1906 is a single cylinder machine with horizontal motor, two speed and reverse planetary transmission, single chain drive and possesses several minor points in construction such as trussed axles, pivotal rear springs and easily repairable radiator that are meritorious.

The angle steel side pieces in the frame are braced together by angle pieces in several places and one heavy arched channel piece carries the cylinder end of the motor. In the spring suspension full elliptics in the rear are pivoted at the top on the ends of a cross shaft made rigid with the frame pieces, and radius rods, also pivoted at each end, extend from the axle casing to brackets on the frame just behind the line of the crankshaft bearings. The front springs, three-quarter elliptic, have the upper leaves bolted direct to the bottom part of the frame angle, the bolts passing through the ends of the leaves. The long leaf in the bottom part of the spring instead of being shackled at the rear end to the frame is made into a loop about 4 inches long and 1 inch wide and through this loop is the supporting bolt, held in place by a bracket on the frame. Surrounding the bolt is a flat coil spring similar to a Hyatt roller bearing, for eliminating all friction occasioned by the spring movement. The method of support is exactly similar in its action to a sliding block with a roller bearing. The front axle is tubing, with jaw steering knuckles secured at the ends and a truss rod fastened to the lower part of the jaw and passing beneath posts on the bottom of the spring seatings for assisting in supporting the axle. The rear axle is of the divided live type, with a spur gear differential in the center, the bevels on the differential being rigid with their respective halves of the driveshaft. Double truss rods, one passing beneath the center of the differential casing and the other slightly to the front, aid in carrying the axle. Long roller bearings at either side of the differential casing carry the drive shafts and above each is an oil cup for lubrication. The road wheels are 28 by 3 inches, pneumatic tires of standard make being the regular equipment. The tread is standard, the wheel base 78 inches and the weight approximates 1,100 pounds.

The motor, carried on the left side of the car, with the head beneath the footboard and the crankcase under the seat, has a bore of 4¾ inches and a 6-inch stroke, generating its rated power at 1,000 revolutions per minute. The support is through two cross pieces of the frame, an arched channel piece near the cylinder head, to which the cylinder is suspended by bolts, and at the rear the case itself terminates in a broad leaf, which is bolted to an angle cross piece. The cylinder is an integral castings, with the crankcase open at the ends and bearing plates bolted thereon. The valves are in the top part of the cylinder head, the inlet at the right and exhaust at the left. Both are mechanically operated from a camshaft carried in the top part of the crankcase, a peculiar feature is the shape of the crankcase owing to the push rods being enclosed, and a further precaution is taken by having a metal cap fit over the valve stems and springs for excluding the dust. The cap is held in place by a thumb screw. The valves are removable through inspection holes in the cylinder head, the inspection caps screwing in place. The crankshaft carries a couple of balance weights and revolves in bronze bushings. In the illustration of the vertical section of the motor and transmission gear it can be noted that the crankshaft is continuous from the left side of the crank case to the outside of the gear case, answering as a shaft for the gear case as well. Both motor bearings are long, that next to the flywheel being slightly the longer.



VERTICAL SECTION OF REO CARBURETER

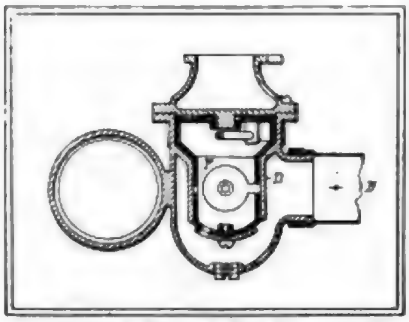
The new Reo carbureter follows the design of separate float chamber, the float stem carrying a needle valve on its upper end for controlling the entrance of gasoline from the fuel tank, and having in one side of the top of the chamber a flushing rod, held up from the top of the float by a coil spring but the tension of which is easily overcome by the pressure of the hand on the end of the rod. The mixing chamber is a cylindrical space with the spraying nozzle slightly raised from the center at the bottom, the air entering through a screened opening at the side opposite the float chamber and the mixture passing to the motor through a throttled opening horizontally placed at right angles to the air inlet. The carbureter is so adjusted that when the motor is not running the gasoline in the spraying nozzle rises to 1-32 inch lower than the top of the nozzle. The air entering through B fills the ring-like space C, within which is a casing D for carrying the barrel-shaped throttle F with a circular opening surrounding the spraying nozzle and another diametrically opposite to it for controlling the passage to the motor. When the throttle is wide open, these openings are one above the other, the throttle one on top, but with reduction in speed, the barrel being turned, the air opening around the nozzle is reduced until a mere slit in the barrel for the needle valve remains and a similar slit permits mixture passing to the motor. In the end of the barrel is an adjustment disk for admitting more air within the barrel than that passing the nozzle and thereby giving additional air without increasing the suction around the nozzle and drawing out too much mixture. This disk can be adjusted from the outside of the carbureter casing. The ease with which the needle valve in the nozzle can be adjusted is a feature of the carburation scheme. The stem E terminates without the casing in a circular plate H with toothed edges and by turning the plate to right or left the needle is lowered or raised within the nozzle and the flow of gasoline restricted or increased. In order to hold the plate in its proper position a spring K is arranged to enter the teeth on the plate and retain it against turning. The carbureter is attached direct to the inlet valve opening, all piping being dispensed with. Air is taken in through a short horizontal screened pipe.

Ignition is by jump spark, the spark plug being placed horizontally in the cylinder head. Beneath the bonnet are two sets of dry cells, and on the dash is a vibrator coil and a two-way switch. The timing of the spark is controlled by a horizontal lever on the steering column. For lubrication there is provided a large glass oiler on top of the cylinder. The oil passes into the crankcase and is distributed by splash.

Digitized by Google

The transmission system consists of a two-speed planetary transmission. To the right of the flywheel is the sprocket A for chain drive to the rear axle. The sprocket is not rigid with the shaft B but attached to the sleeve C carrying the gear D. In the center of the gear case is the drive gear E keyed to the shaft and through which the drives are gained. For the high speed ahead the high speed cone M is forced within the dogs N, forcing them asunder and at the same time locking the entire gear case with the shaft giving direct drive. The spring O assists in releasing the clutch. For slow speed ahead the inside band is brought into use and the drive is through the gear E to F and through G to D and D being on the same sleeve as the sprocket A the drive is complete. The different speeds are gained through the use of the side lever and a foot pedal, the former in its forward position giving direct drive and slow speed when back, with the neutral midway. A pedal is used for the reverse. All gears within the case run in oil, oil cups being provided for that purpose.

Motor cooling is by water circulation maintained by gear driven pump on the left end of the crank shaft. The pump connects with a pipe from the water tank beneath the bonnet and with another running to the water jacket near the exhaust valve. From the top of the radiator is a pipe connecting with the tank and the bottom of it is piped with the valve port adjacent to the inlet valve. The radiator consists of horizontal flat tubes arranged in sets of four and with a dozen sets. Viewed from the front the radiator looks like so many single flat tubes running from side to side and joined at the ends, but a look shows that what appeared as one tube is in reality four tubes side by side, each connecting in the same cross tube connection at the ends. These four constitute one set of tubes and the twelve sets are placed one on top of the other with connections between the sets made at the



HORIZONTAL SECTION REO CARBURETER

cross tubes in the end. The connections are made so that it is easy to take one set out should a pipe in it become damaged and the remaining pipes would then work equally as well, the feature of its construction being this method of taking out injured tubes when on the road and then proceeding with a perfect radiator. It forms the front of the bonnet.

The steering is through a Brown-Lipe irreversible worm gear with the rod connecting the knuckles passing behind the axle. The muffler, of Reo design, is long and cylindrical, hung lengthwise at the right side of the cylinder, the front end so close to the exhaust valve that only an elbow of piping is used for connecting them. A cutout is provided. Two band brakes are provided on the rear hubs, being the only ones used. They are double acting and applied by pedal. A small pedal for compression relief to be used in cranking is also furnished.

The body work is finished in green with light running gear. The individual seats are heavily upholstered and the back platform is removable and ordinarily carries a half oval-shaped carrying compartment, the latter, however, is removable and in place can be attached a platform for a folding gear seat giving the runabout a carrying capacity of four. When folded the seat does not interfere with the general lines of the machine. The bonnet is held in place by four thumb screws but has side doors for reaching the battery and a top one for filling the water and gasoline tanks. The headlights are attached to it and removable with it, removal only being necessary when repairing the radiator or tanks.

The speed change lever does not extend to the footboard, but works on a shaft beneath the seat, connecting rods being used between the shaft and the bands around the transmission drums. Very small fenders are used over the rear wheels.

The Reo company also has ready for 1906 its 16-horsepower, two-cylinder car, with the motor placed lengthwise in the center of the car. The machine has accommodations for five passengers, has double side entrances, 90-inch wheel base and weighs 1,550 pounds.

NEW MITCHELL MODELS

Four models are included in the 1906 line of the Mitchell Motor Car Co., of Racine, Wis. Two of these, an 8-horsepower, two-cylinder runabout and a 20-horsepower, four-cylinder touring car, are last year's machines with some changes, and innovations as well, but the other two are new ones. The smaller one is a four-cylinder runabout to be rated at 14 horsepower, with cylinders with a bore and stroke of 3½ and 4 inches respectively. The other is a 28-horsepower touring car driven by a four-cylinder, vertical motor. In all of these models no radical changes are to be found, but such alterations as new radiator design and changes in the shape of the hood improve the appearance considerably. Such construction as pressed steel apron extending from the front of the car to the rear of the transmission, protecting all working parts, is new. A foot accelerator is used for controlling the speed of the car and the transmission has been improved by more carefully finished parts, greater attention to lubrication and

Inside Cards of Bullard Speed Recorders

other ways. In addition to its general pleasure use the company is pushing through over fifty of its light trucks and delivery wagons. Bodies in two styles are being fitted to these, one intended for express work and with the seat placed high in front directly above the engine, and the other an enclosed delivery with the seat in the rear of the motor, which is covered with a bonnet as in the touring cars. The company during the coming season is arranging to put out 100 of the two-cylinder runabouts, 300 of the four-cylinder runabouts, 200 of the 20-horsepower cars and the same number of the larger touring machines.

RECORDS ALMOST EVERYTHING

A speed recording instrument which records on a disk of paper the speed a car travels and the exact minute of the day at which the speed is made, should be a good weapon of protection against the ready timing police officials who swear by stop watches against all comers. Such an instrument is marketed by the Reading Automobile Co., of Reading, Pa. J. H. Bullard is the inventor.

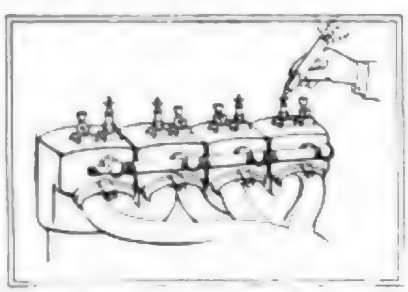
The device consists of a clock like movement, with other appliances, which are connected to the sprocket on the driving wheel of the automobile. The device carries a circular paper card on which, while the car is running, is noted a record of the speeds made and the hour at which they are made. The marks made on the card are perforations. Four perforations represent a mile traveled and as each fourth perforation is heavier than the intervening ones it is easy to read the number of miles. The card has fourteen concentric circles, with twelve intervening ring like spaces. Each ring like space represents 1 hour. The ring like spaces are divided by sixty radial lines into as many spaces, each space representing 1 minute. Within the inner circle are the figures 5, 10, 15, etc., up to 60, representing the minutes in the hour, as on a clock face. The card is secured to the clock mechanism so that as the hands of the clock revolve so does the card, but the perforating needle remains stationary and makes a perforation in the card at the end of every ¼ mile. The card with its twelve ring like spaces and each divided into sixty spaces represents 12 hours and will register for that period. The record of the first hour is shown in the outer circle of spaces and that of the 11 succeeding hours in the spaces towards the center of the disk. Arrangements are made so that at the end of each hour, or when the perforating needle comes to the line marked 60, it passes into the next ring like space.

The card illustrated represents an actual journey from Worcester to Springfield, Mass. The reading of the record is accomplished by placing it with the figure 45 at the top and then looking at the outer circle of perforations or dots. The start was made at 47 minutes past the hour, represented by the circle carrying the dots, which, if the disk had been attached to the clock at midnight, would mean at 47 minutes after 7. The first puncture was 1 minute later. The card not being set correctly in the instrument the stylus changed into the next inner circle at the left of the 55 line instead of at the left of the 60 line. This makes the first puncture at the left of the 55 line as the beginning of another hour. By following the dots in this circle the performance of the car during the first hour of the trip can be found. With one dot in a space, each space representing 1 minute and each dot ¼ mile, the speed of the car was 15 miles per hour and practically 14 miles were made in the hour, there being that number of heavy dots. In the last part of the journey, two dots are shown in each space between the figures 25 and 45 or in a period of 20 minutes showing the speed to be 30 miles per hour. With three dots in each space the speed would be 45 miles per hour and with four in each the machine would be running a mile-a-minute clip. The record shows the distance, found by counting the heavy dots, to be 50½ miles between Worcester and Springfield.

When a stop is made with the automobile the instrument ceases to perforate the card, which continues, however, to revolve and the length of the pause can be calculated by counting the number of non-perforated spaces between the last perforation when the stop was made and the first one when restarting. The instrument because of this feature could be used to advantage on livery and delivery wagons where the owners would want a record not only of the speeds made, the times in which they are made, but the length of stops and when they occurred.

NOVEL SPARK TESTER

Discovering if a charge of gas is firing properly without removing the spark plug or in any way interfering with the wiring of the motor is what the Smith spark tester, a product of the Duck Brake Co., of New York City, is designed to accomplish. The Smith tester is a little tubular



How Smith's Spark Tester is Used

Front View Bullard Speed Recorder

device, lead pencil-like in shape, with the pointed part insulated and the handle part a brass tube, in which flashes occur when testing a cylinder. The tester does not follow the construction of a spark gap or intensifier but is claimed to be scientifically constructed with the object of not injuring the coil when used in making a test. To test a plug the tester is placed on the end of the spark plug or any uninsulated portion of the secondary wiring or coil and a bright flash will be seen in the tube each time a spark takes place on the sparking ends of the plug. The tester is held in the hand when being used and the variations in the spark or flash within the tube indicate peculiarities of the spark within the cylinders. If no flash occurs when the tester is on the top of the plug the porcelain may be injured or the points sooted. Flashes of too great intensity are interpreted as due to imperfect condition of the contacts of the commutator, continual flashes indicate a weak battery, poorly adjusted vibrator, defective coil, leak in the secondary wiring or the sparking points of the plug too close together, and a light shock, experienced by the person holding the tester, could be traced to a too wide spark gap at the end of the plug or an excessive amount of battery. Persons susceptible to electric shocks can avoid such by connecting the brass tube of the tester by means of wire to any part of the metal work of the car. The maker claims to be able to make use of the tester in adjusting the coil vibrators by placing the insulated point of the tester on the terminal of the coil leading to the spark plug while making the adjustment, the best point being when the brightest light appears in the tube.

HOLLEY'S NEW CARBURETER

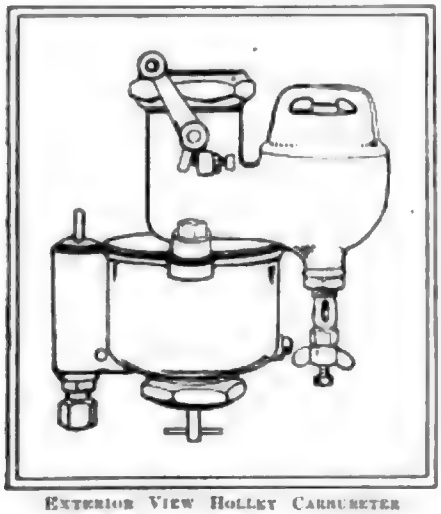
Model E, the 1906 carbureter manufactured by Holley Bros. Co., of Detroit, Mich., possesses as its leading features a cylindrical float, with the spraying nozzle in the center; a spring controlled compensating air valve for use on high motor speeds, and either a horizontal or vertical outlet for connecting the pipes to the motor, making the carbureter well adapted for either horizontal or vertical motors.

Viewed from the outside the carbureter consists of two parts—a circular float chamber at the bottom, with a slight expansion on one side for containing the needle valve, and an upper casting, slightly

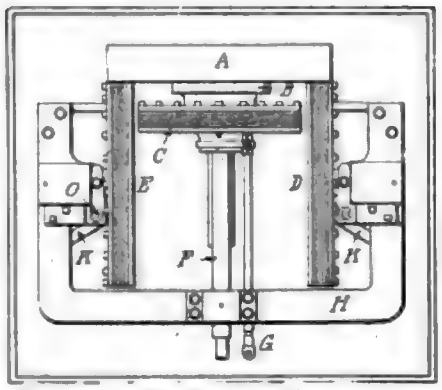
Digitized by Google

U-shaped, with the exit to the motor at the top of one arm of the U, the compensating air valve at the other and the union with the float chamber at the bottom. Air enters through A, a passage which is always open, mixture passes to the motor through the exit B, additional air enters through C, the pipe E connects with the gasoline tank and L is the needle valve for regulating the flow of gasoline and is controlled from the float D through the medium of the lever H fulcrumed at T. As gasoline enters, the float rising as a consequence, allows the lever to trip on its fulcrum, which permits the needle L to lower, closing the passage and stopping the entrance of fuel until that within the float chamber is consumed, when the float lowers, and resting on the lever, lowers one end of it, at the same time raising the opposite end attached to the needle valve and opens it. The union E from the gasoline tank slides into the bottom of the carbureter casing, some packing is used and the packing nut S is screwed in place, a construction permitting the removal of the carbureter with comparative ease. The rate of flow of the gasoline through the spraying nozzle is controlled by the needle point on the upper end of Q, a few turns of which to the right will shut off the entire flow of fuel and a turn or so in the opposite direction will give the required amount of fuel On the bottom is a cross head for facilitating its adjustment.

The mixing chamber M is considerably restricted at the nozzle and a short distance above, and beneath the nozzle, is shaped cone-like, causing the inrushing air to focus practically at the top of the nozzle, the meeting currents of air practically atomizing the gasoline. Directly above the nozzle and in the top of the mixing chamber is the exit to the motor controlled by a throttle, the lever R being for connecting the throttle either with governor or lever on the steering wheel of the car. At slow motor speeds sufficient air enters through A to satisfy the motor, but with speeding the suction of the cylinders is beyond the capacity of A and the compensating valve N begins opening, the motor suction being sufficient to overcome the tension of the spring O, which holds the valve on its seating. The adjustment of the valve is one of the features of it.



Exterior View Holley Carbureter



Detail of the Gearless Transmission

When too weak mixture is obtained the thumb nut P is loosened and the screw raised thereby restricting the maximum opening of the valve, the bottom of the valve stem coming in contact with the top of the screw.

A GEARLESS TRANSMISSION

Friction transmission of power from the motor to the driveshaft in an automobile has a new exponent in the Gearless Transmission Co., of Glen Falls, N. Y., which has a type in which a clutch is used within the flywheel to flexibly connect the crankshaft with the driveshaft for direct drive on the high speed when the friction wheels are not used and do not even revolve. On the back face of the flywheel A is the band clutch B, so designed that it can by means of a pedal be made to connect the driveshaft F with the crankshaft carrying the flywheel and at the same time the friction disks E and D are moved away so they are neither in contact with the friction wheel C or the face of the flywheel A. This makes the direct drive the same as in a car with a sliding, planetary or individual clutch transmission, friction wheels not being used in the transmission of the power.

For all speeds other than direct drive the friction disks E and D have their peripheries in contact with the back face of the flywheel near its periphery. This causes the disks to rotate in opposite directions, being in contact with points on the flywheel diametrically opposite to each other. Between the disks is the friction wheel C, splined on the transmission shaft F. The wheel can be moved backward or forward through the medium of the shifting rod G. The periphery contacts with the faces of the friction disks, the latter being at opposite sides of it, and, revolving in opposite directions, impart movement to the wheel in the same direction. With the wheel in the position shown in the illustration—that is, contacting with the friction disks near their periphery—the fastest speed other than direct drive is obtained, and as the friction wheel C is pulled backward closer to the axes of the friction disks the speed of the same is reduced until in line with the axes, when it will be motionless and when in the rear of the axes a reverse speed is obtained. Contact between the disks and the friction wheel is gained by moving the disks against the wheel, accomplished by the pedal levers K, of bell crank shape, pivoted at O and with one end attached to a yoke working on a collar on the disk shaft and the other end connected with the pedal on the foot board. When traveling on all speeds other than direct drive the band clutch in the flywheel is withdrawn. The friction wheels are carried on the framework H, of rectangular shape and designed to be bolted to the side pieces of standardly constructed car frames.

MOTOR CAR LITERATURE

"What They Say About Us" is how the J. Stevens Arms & Tool Co., of Chicopee Falls, Mass., names a booklet that is filled with letters from users of its machines. In the last few pages are given full mechanical details of the cars made by the concern.

"Positive Proof" is what George Crane, manager of the Knox branch in Chicago, calls a little book he is distributing in the interest of Knox pleasure and commercial cars. The book lists the different machines and has several pages of letters of commendation on them.

"Frenzied Jack Sense," published for everybody by the Duff Mfg. Co., of Pittsburg, Pa., tells in decidedly blank verse the story of the automobile jack and the ills coming to those who use poor ones. Throughout the rhyme Barrett jacks are introduced. The booklet can be considered a clever bit of publicity.

Tindel Morris Co., of Eddystone, Pa., has issued a little book on crank shafts in which are illustrated thirteen styles of crank shafts, for single, double, three, four, five and six cylinder engines. The reading pages alternate with those devoted to illustrations and in them the nature of the metal used and the construction of the shafts are given.

"Other People's Experiences" is the name of a little book issued by the H. H. Franklin Mfg. Co., of Syracuse, N. Y., on experiences of users of its machines. Upwards of fifty short accounts of their troubles and pleasures are given by Franklin drivers. The company also has ready a twenty-two page catalogue on its 1906 machines in which the general features of them are given and also a full page illustration of each. Two pages are devoted especially to giving specifications and in which every important feature in the construction is shown.

Among Makers and Dealers

Reo Stock Car Made Into a Reo Racing Car at a Coast Garage

Has New Idea—A patent has been granted to Victor E. Chamberlain for a controlling device for motor vehicles.

Handles Columbias—The Automobile Depot, incorporated, will open a new salesroom at 1597 Broadway, New York. It will handle Columbia electrics.

Meade in Charge—The Ford people have opened a Chicago branch with temporary quarters at 1413 Michigan avenue, which is in charge of C. C. Meade, for some time connected with the Ford forces in New York city.

Eames Is Out—Hayden Eames, of Cleveland, terminated his management of the sales of the A. O. Smith Co., of Milwaukee, last Saturday. He requests that all orders and correspondence concerning the Smith factory products be sent to the makers direct.

Fast Pace by Reo—Leavitt & Bill, of San Francisco, representing the Reo in northern California, report success with a Reo racer made from a stock car. It has made 1 mile in 1 minute 17 seconds and 5 miles in 6 minutes 30 seconds, and in a recent race beat its rivals about 20 seconds to the mile, it is reported.

De Dietrich Deal—Baron Adrien de Turckheim and W. M. Letts have just concluded a deal whereby the American agency of the de Dietrich will at once go to Allen Halle & Co., of New York, who formerly imported the Mercedes. The de Dietrich garage on West Forty-eighth street is to be closed, and new headquarters opened on Fifth avenue.

Boyd's Stock Sold—Acting under the instructions of the court, which recently rendered judgment against James W. Boyd, president of the Columbia Automobile Co., of Washington, D. C., in favor of the government, the United States marshal sold at public auction last week the goods and chattels of Boyd's company. Eight second hand cars, including Franklins, Oldsmobiles and a Waverly electric, were sold, together with the equipment in the company's garage on Eighteenth street. About $4,000 was realized. As reported in Motor Age, Boyd was recently arrested on a charge of embezzling $20,000 from the government while employed in the marine hospital service. He is now out on bail.

New Detroit Garage—A new garage is to be built at the northwest corner of Woodbridge and Brush streets, Detroit, Mich.

Will Not Move—The Oscar Lear Automobile Co., notwithstanding reports that it was about to remove, is planning the erection of a new factory at Columbus, O.

South Coming Up—The Crescent City Automobile Co. is erecting a garage on South Rampart street, near Tulane avenue, New Orleans, La. The president of the company is W. Philip Johnson, and Charles U. Kennedy is manager.

Buys Out Wyckoff—Herbert Austin has bought the business of L. J. Wyckoff, of 484 Broad street, Newark, N. J., and will engage in the sale, repair and rental of automobiles. Associated with him will be Charles Krebs, who will have charge of the mechanical department.

Keeps Old Place—W. J. Riddell, of Des Moines, Ia., has closed a 7-years' lease of the Len Harbach building at the southeast corner of West Eighth and Locust streets and will continue in the automobile business there, having abandoned the idea of securing new quarters. The present building will be remodeled to suit his needs.

Bill Dismissed—In the suit brought against Charles E. Miller by Gray & Davis, of Amesbury, Mass., for handling the so-called bullet-shape lamps made by the Atwood Mfg. Co., of Amesbury, Mass., Judge McPherson in the circuit court in Philadelphia on the 4th inst. rendered a decision dismissing the bill at the cost of the complainants, reports state.

Maxwell In Chicago—A. F. Chase, of the Maxwell-Briscoe-Chase Co., which will handle Maxwell cars in the central west, is in Chicago seeking a location for the offices and salesrooms of the company. He is considering taking space in the Old Colony building, corner Van Buren and Dearborn streets, and will open up soon. From the downtown site the company will wholesale and retail, while Dan B. Southard, at 14 Michigan avenue, will continue to rep sent the car on the row.

Factory Proposition—A proposition h been received by the board of trade the erection of an automobile factory Fostoria, O.

New Utica Garage—The Miller-Mund Motor Car Co. will open a garage Utica, N. Y., for the sale, storage and of automobiles. The new establishm will accommodate 100 cars.

Plans for Factory—C. R. Greene filed plans for a new factory for the troit Auto Specialty Co., to be built the west side of Greenwood avenue, Detroit, Mich. The cost of the build is to be $10,000.

Has New Salesroom—A new salesr and garage is building for S. A. Mi Hartford agent for the Knox and Pie cars. It will be a half block below present Miner station and will have feet frontage on Allyn street and extend 88 feet on High street.

To Quit Lockport—It is said that Covert Motor Vehicle Co. will remove Rochester, N. Y., from Lockport. plant is now located at 57-61 Richm avenue, Lockport, but the present l tion is too small for the rapidly incr ing business, and as most of the st holders are Rochester men, they will p ably seek a location here.

Moves to Foxboro, Mass.—The Amer Coil Co. has moved from West Somer Mass., to Foxboro, Mass. It has t over the entire business of the Shel Mfg. Co., of Boston, Mass., including combination spark plugs, mixing v and other electrical specialties, and manufactures induction coils, ignition namos, sparking plugs and encased b ies of the American brand.

After Factory—There is conside talk of renting the doll factory at I antville, N. J., for the manufactur automobile and marine engines. question will shortly go before the cil and definite action will be take the subject. The firm back of the ject is now located in a Pennsyl town, but if suitable arrangements be made will remove here at once.

Shows Valveless Engine—Much in has been manifested the past week automobile men in the two-cycle air- gasoline engine of W. C. Hays, whic been on exhibition in the Phipps building, Pittsburg. The engine h cylinders and no valves. It has a ca of 25 horsepower and weighs only pounds. It is 30 inches in diamet the shaft is 30 inches long. The m very much like a fire blower.

New Toledo Enterprise—The Ra Lacy Co., of Toledo, O., with a stock of $30,000, was incorporate week for the purpose of manufac gasoline engines, ranging from 3 horsepower of the two-cycle typ from 20-horsepower up in the fou type. The incorporators are Pe Jones, Paul H. Jones, Edward Ra Volney E. Lacy, Jr., Frank H. La W. L. Lamb. Volney E. Lacy h connected as designer with the Pope

Digitized by Google

people, while Edward Rathbun has been with the S. M. Jones Co. as engineer and designer.

New Hood Idea—A patent has been granted to Harry Raphael and E. D. Toops, of Indianapolis, Ind., for a folding hood for automobiles.

Premier in Los Angeles—The Premier Motor Mfg. Co. has established an agency at 1042 South Main street, Los Angeles, Cal., which will be in charge of W. Crosby and G. E. Bradbeer.

Aster Branch—The Aster company, of Paris, has opened an American branch at 1591 Broadway, New York, for the sale and exhibition of Aster motors, automobile parts, etc. A. J. Myers will be the manager of the branch.

After Ohio Business—The King Mfg. & Garage Co., recently incorporated for $20,000 and taking over the business of the King Mfg. Co. at Springfield, O., will job accessories as well as conduct a garage. It is about to move into a three-story building, equipped for garage purposes.

Mitchells in New York—Mitchell pleasure cars will be handled in New York during the coming year by the Motor Vehicle Repair & Storage Co., and the Mitchell truck will be sold by the Mitchell Motor Vehicle Co., which has taken the old Ford stand at Broadway and Fifty-ninth streets.

Has Pneumatic Hub—A company has been formed to manufacture and put on the market a pneumatic hub, which is to take the place of pneumatic tube tires, on automobiles and other vehicles. The inventor of the device is C. F. Marohn, a manufacturing chemist, of Milwaukee, Wis., and patents have already been applied for.

Factory for Madison—J. M. Crosby and M. F. Bates, of Lansing, Mich., have been in Madison, Wis., with a view to locating an automobile factory in Madison. They want the residents of Madison to subscribe for $161,000 worth of the $250,000 stock. They promise to employ 200 men and will need from 40,000 to 65,000 square feet of floor space.

To Build Own Plant—The Windsor Motor Car Co., located at Evansville, Ind., will use the plant of the Single Center Spring Co., until its own plant can be completed. The company will build cars using the Worth friction transmission. An election of officers, held last week, resulted as follows: President, J. C. Zutt; vice-president and general manager, J. A. Windsor, Jr.; secretary and treasurer, W. M. Copeland. These, with W. R. Donaldson and A. F. Karges, are directors. Mr. Windsor hails from Chicago.

Big Garage Opens—At Broadway and Fifty-sixth street, New York, the Automobile Salon, claimed to be the largest garage in the world, was formally opened by Smith & Mably Tuesday afternoon and evening with a reception having the accompaniment of music and refreshments. A fashionable crowd thronged the building. The garage is of brick and steel and has four storage floors, each with complete equipment, lockers, etc. The total floor space aggregates 76,000 square feet, and will furnish storage for about 450 cars. Repair shop, supply stores, electric charging departments and chauffeur quarters are all commensurate with the magnitude and elegance of the entire plant, in which no expense has been spared in the endeavor to produce something a little ahead of men up to date.

CONVALESCENT OFFICERS' AMBULANCE

Joins Gallaher—H. A. Weaver, formerly of the Pecauville company, has joined the Richard-Brasier company as assistant to E. B. Gallaher in New York.

McDuffee Aides—H. C. Tillotson has assumed charge of the Chicago branch of the McDuffee Automobile Co., which handles the Stoddard-Dayton. Associated with him will be Edwin F. Heywood, Jr.

Sold Its Lease—The Winton Motor Carriage Co. has transferred its 10-years' lease to Lawrence Sinnott for a consideration of $35,000. The transfer is the lease of the Huron street building, Cleveland, held by the motor car company.

Paid for By the King—The convalescent home for officers at Osborne, Isle of Wight, has been presented with a special 18-horsepower Wolseley car by King Edward. It is luxuriously upholstered and has a handsome body with windows fitted. There are six detachable fauteils, in addition to a phaeton seat in front.

Leased New Place—The Motz Clincher Tire & Rubber Co. has leased a portion of the old Webster, Camp & Lane plant at North High and Main streets, Akron, O. The Buckeye Rubber Co. will continue the manufacture of the Motz tire, but the finishing of the product will be done at the new plant. The company will shortly start in working up its foreign trade, as it has patents in several European companies, which it will publish.

Moved to Boston—The Dodge Lubricator Co. has removed to 36 Columbus avenue, Boston, where the Dodge positive oilers will be manufactured.

Used by the Swells—A typical shopping scene in New York is illustrated in a photograph recently taken in Gotham showing a society woman stepping from a White victoria in front of the store of Tiffany & Co., the jewelers.

Expensive Garage—Architects Simonson and Pietsch are to prepare plans for a garage to be built at the northeast corner of Maryland and Mount Royal avenues, Baltimore, Md., for Gillett Gill, the cost of which is estimated to be about $150,000. Work will start soon.

Another in Pittsburg—The latest automobile firm to be established in Pittsburg is the Central Automobile Co., composed of Edward G. Mooney and Edward Seely. The company has commissioned Architect J. E. Obitz to prepare plans for a one-story brick garage, 50x150 feet, in Broad street near Euclid avenue, East End, to cost $16,000.

Enlarging Place—The Atlas Automobile Co., of Pittsburg, which claims to have sold 370 second-hand cars since it started in business in 1900, is having plans prepared for a two-story and basement concrete garage to be built in the East End at a cost of $35,000. The building will be 85x120 feet and will afford storage for 300 cars.

Change In Winton Itinerary—A revised itinerary of the Winton exposition car has been issued from Cleveland. The car was in St. Louis Tuesday and Wednesday and was due to arrive in Chicago today, where 3 days will be spent. Milwaukee will be visited on the 23d, Minneapolis on the 24th and 25th, St. Paul on the 26th, Des Moines on the 27th and Kansas City on the 28th and 29th. From October 31 to November 3, inclusive, the car will be in Denver. November 5 it will be in Salt Lake, 7th at Sacramento, 8th at Stockton, 9th to 12th at San Francisco, 13th at San Jose, 14th at Fresno and 15th and 16th at Los Angeles.

NEW WHITE CAR WITH VICTORIA BODY, AS SEEN IN NEW YORK

ROADSIDE TROUBLES

An Ounce of Prevention

Copyrighted by the American Motor League

By Chas. E. Duryea

BURSTED TIRE—A tire sometimes bursts without previous warning in the shape of a lump, which being wrapped on the outside, or reinforced by cementing fabric on the inside, may not give trouble. If the burst is several inches long, it is usually possible to draw out the air tube far enough to slip a piece of shingle or stiff cardboard under it. This will hold the tube flat and permit patching it without removing the tire. After being patched it is pushed back through the breach and very lightly inflated. Be sure that it has not crept and that the casing is in place all around. When the tube rests against the casing, but without protruding through the opening, put a few wrappings of cord around the bursted portion, so as to hold the aperture closed and pump a little firmer. Then wrap the tire for a space about an inch longer than the opening smoothly and closely with cord, making sure that the aperture is closed. The wrapping should be slightly smaller than the outside diameter of the tire, but not much smaller, the object being to have the tire the same size at that point after completion of the repair as at any other point, instead of larger or smaller. When the wrapping is completed, wrap with tire tape, so as to completely protect the cord from water and dirt. In wrapping with tape the layers should overlap each other like the scales on a fish, the laps being made so that the driving effort of the tire against the ground is in the proper direction to smooth down the laps, instead of lifting them.

CARBURETER OR VAPORIZER TROUBLES.—Many things may happen to a carbureter. A grain of sand may clog the float. Water may interfere with the regular flow of gasoline, or while standing on a cold day, the water may become ice, holding the float immovable or stopping the passage of gasoline completely. The ice can be thawed by an application of hot water, or if there is absolutely no leak of gasoline, the heat of a torch outside will quickly melt the ice. This proceeding, however, is dangerous with many vaporizers and must only be exercised with judgment. Care must be taken when the carbureter is opened that no dirt drops into it, for this is likely to clog the spray tube. Lint, leaves and sometimes waste is drawn into the air pipe. This not only prevents full charges, but may cause over-rich mixtures, or, on the contrary, failure to spray at all. It is usually possible to form an idea of the trouble by opening the peep cap of the cylinder or removing the plug and applying a lighted match. If the mixture is too rich, it will burn yellow; if too poor, it may not burn at all or faintly blue, but if just right, it will explode and rush out the opening to the danger of one's fingers. If it seems to be poor, injecting a little gasoline from a squirt can or flooding the carbureter will prove whether or not the diagnosis is correct and, having determined what is the trouble, the cause may usually be found. An over-rich mixture may be caused by a leaky float, which, containing gasoline, is too heavy to perform its duty. If this is held leaky side down and warmed slightly, the gasoline will be expelled, after which the float will probably serve until it can be repaired. To repair a leaky float a very slight vent should be made in it at some place easy to solder. The leak is then soldered and the float made cold. Placing it on a piece of ice will serve. Then solder the vent hole with a light touch to avoid warming the float, and the air contained will be substantially at atmospheric pressure instead of under a partial vacuum, inviting a leak. The float chamber should always have provision for withdrawing any water and for removing the float and replacing the same easily, and in this, as in many other parts, the designer should keep in mind roadside repair as well as factory costs. If a cork float gives trouble, dry thoroughly in a warm place and varnish with shellac.

FAULTY COMPRESSION — The operator should learn promptly to notice the compression. It should be substantially alike in all cylinders and if it quickly grows less something is wrong. If the change is gradual the valve may be warping and needs regrinding. One or more piston rings may be broken or there may be a leak through some gasket or even through a sandhole in the casting. Turn the motor slowly and listen for the hiss of escaping air. If too small to hear, hold a candle at various points until the leak is located. A bent valve stem may cause the trouble. If there is no compression whatever and this condition comes on suddenly, look first for a stuck valve. Lubricating oil, baked on the valve stem, may prevent its operating properly. A broken spring will fail to close the valve or the valve itself may be broken. A spark plug or inspection cap may be loose or even lost out entirely. Sometimes a leaky piston is caused by the openings in the rings coming on the same side, in which event the rings need turning around. They are usually pinned, however, so this trouble seldom occurs. Insufficient lubricating oil, oil of too low fire test, or oil containing dirt and grit always contribute to leaks past the ton. A broken porcelain or faulty p ing in the spark plug is not infrequent sometimes hard to find. If the exh valve stem is too long, the valve ca seat properly. Sometimes it will be a when cold but the expansion will c trouble when hot. The remedy in case is to make the valve stem shorter adjustment or filing, if necessary. trouble usually manifests itself by heating the valve and parts.

THE COIL—LOW tension coils seldom trouble, for they are simple in cons tion. Sometimes, however, they get soaked, which permits enough leaka electricity to destroy their value. this case they must be baked at a perature higher than boiling water the water is completely driven out of If convenient to boil them in par wax, this will not only boil out the but will render the coil waterproof prevent further happenings of this Soaked coils are quite frequent in work but this seldom happens in c tion with automobiles, for the coil i ally placed so that water cannot rea A careless stable boy, however, u forgets that an automobile contains anism and drenches it inside and out the result that the user wonders ho troubles could have been caused. tension coils are so susceptible to m that they are always waterproofed being sent out, but being more compl and carrying electricity of extremel voltage, they sometimes give trou cause of water on the exterior. therefore, wise in wet weather to e all parts of the coil, high tension and spark plug to make sure that of water is not carrying away a lar of the current. Wires are son broken or are destroyed by the ac the soldering fluid used to atta terminals. The ends remaining in or the undestroyed portion of the wi serve to carry a spark, but not cient intensity to prevent misfiring. bles of this kind can hardly be fou remedied by the roadside, but at t occasion a good coil should be sub and results compared. This will mine whether or not the fault is coil, and if so, prevent searching f ble elsewhere. With vibrator coils lar attention must be paid to the of which the adjustment will changing with different strength tery current.

CLATTER—Many things may mak ter around an automobile. Most can be tightened or adjusted s stop the noise. Noise is unnecessa and should be avoided, and the should either remedy the noise that it cannot be remedied and b recognize it from other noises. the user should train his ear to r the various sounds and separate lar and proper ones from those be trouble. After a little practice will detect new and strange sou many others with almost the sa ness and certainty as if the other exist. A strange clatter should b ly investigated, for the tale it tel something is out of order and a time saves nine.

EDITOR'S NOTE—This is the thirteenth of a series of articles by Charles E. Duryea. These articles will be prepared for publication in book form and will be distributed by the American Motor League to its members during the coming year.

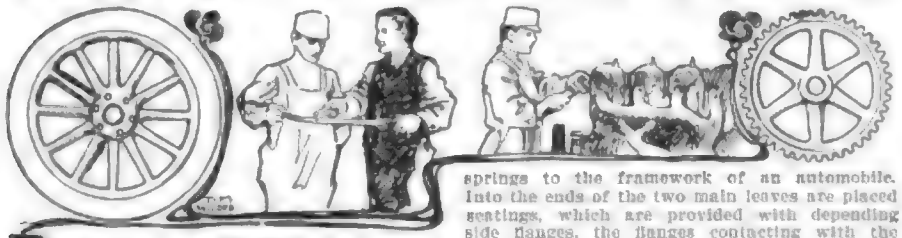
Current Automobile Patents



LETTERS PATENT No. 801,521, dated October 10; to Jackson O. Haas, Pottsville, Pa.—The invention is a unique design of automobile frame. The side pieces are made of Z iron, being connected at the rear by two cross pieces, each of which extends beyond to cross pieces, so that the ends of the spring can be shackled thereto, thus leaving the side pieces free from spring hangers. Near the front of the frame is a similar cross piece for the attachment of radius rods to the front axle and for securing the steering column. The front springs are semi-elliptics placed transversely and pivoted at the top of their arch to a horizontal bolt on the frame, and at their ends shackled to seatings on the axle. The axle is connected with the frame work so that it may oscillate in an inclined plane, and the steering knuckles are pivotly connected in the usual way.

Letters patent No. 801,481, dated October 10; to Lewis C. Shipley, New York—In the construction of the frame work for a canopy top for automobiles the inventor uses standards for supporting the top, placing four on each side—at the dash, side of front seat, and front and rear of the sides of the rear seat respectively. An extra support is placed between the individual front seats. The standards are pivoted to metal supports secured in the framework of the seats, and catches are used for holding the standards in a raised position with reference to the supports. The upper ends of the standards are provided with slots to which the cross pieces of the canopy are secured, and diagonal braces are used on either side of the front seat. The framework, carrying the glass above the dashboard, consists of standards at either side, so hinged that the pieces will fold, one over the other, when the pane of glass is moved up beneath the top of the canopy, leaving the front of the car without standards of any description and permitting of an unobstructed view by the operator.

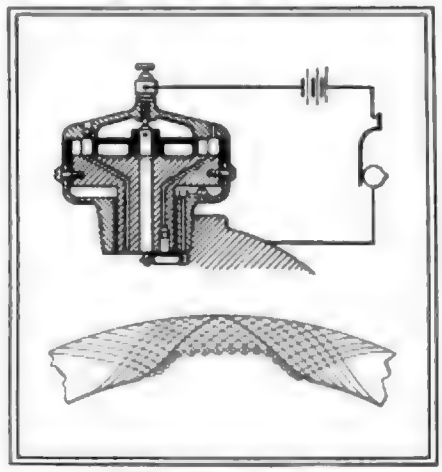
Letters patent No. 801,823, dated October 10; to Ernst J. Berg, Schenectady, N. Y.—In propelling an automobile a gasoline engine is used in driving an electric generator and the generator in turn furnishes an electric current for any number of electric motors connected in any desirable way with the road wheels of the vehicle. A feature of the device is that the generator, while driven by the gasoline engine, is used to furnish ignition current, which is accomplished by connecting the ignition devices of the engine to points on the generator commutator, having a difference of potential equal to only a fraction of the terminal voltage of the generator. In doing this the generator is furnished with an auxiliary brush, displacing a small amount of the main brush, and the spark coil of the gasoline engine has its primary wire connected between the main and auxiliary brush of the generator.

Letters patent No. 801,452, dated October 10; to Benjamin G. Gilbough, Chicago—In his ignition device for gasoline engine the inventor makes use of a rotary electrode operated by fluid pressure, the inlet and exit passages for the fluid being controlled by valves. The device comprises a casing with a removable cap and a hollow threaded stem. Within the casing is a core provided with passages, the inlet and outlet having valves attached. A wheel with two oppositely disposed series of blades is placed so that the blades register respectively with the outlet and inlet passages of the core. A rotary electrode is actuated or driven by the wheel and co-acts with the other electrode, located outside of the casing. The cam movement without the casing is used for making and breaking the circuit.

Letters patent No. 801,504, dated October 10; to Gustav Baumann, Chicago—The inventor offers a new method of attaching semi-elliptic springs to the framework of an automobile. Into the ends of the two main leaves are placed seatings, which are provided with depending side flanges, the flanges contacting with the ends of the leaves, as well as with the sides of the shorter leaves, and tending to hold them from lateral sway. The depending flange is secured to the framework of the car.

Letters patent No. 801,359, dated October 10; to Henry C. B. Cave, London, England—The pneumatic tire described has the outer casing composed of strips of nickel steel that are so interlaced with one another as to lie

GILBOUGH'S IGNITER



CAVE'S PNEUMATIC TIRE

obliquely with reference to the periphery of the cover. These strips are broader over the tread of the tire, so that when the tire is placed on the wheel and inflated the strips will mesh perfectly with one another. The ends of the cover are braided to points and brought together and the strips are then plated crosswise and attached to wires.

Letters patent No. 801,155, dated October 3; to Harry Raphael and Emery D. Toops, of Indianapolis, Ind.—The invention is a folding hood for covering the motors in automobiles. The hood is cylindrical in shape and consists of two parts secured at opposite sides of the motor, each part in turn being composed of several parts hinged together and folding down one upon another. Latching devices connect the terminal sections of the two principal parts for holding the hood together above the motor.

Letters patent No. 801,353, dated October 10; to Ernst J. Berg, Schenectady, N. Y.—The object of the invention is to control the speed of a gasoline-electric machine solely by changing the spark and simultaneously altering the throttle. In the front of the machine is placed a vertical motor with any number of cylinders. The motor is connected directly with an electric generator and the latter furnishes current to electric motors which are geared directly to the rear wheels. In controlling the speed of the car the electrical connections between the generator and electric motors are not interfered with in the least, all variations in speed being obtained by varying the speed of the gasoline engine. This arrangement of the power plant dispenses with the use of other levers than throttle and spark control.

Letters patent No. 801,209, dated October 10; to Littleton K. Buck, Freehold, N. J.—The invention is a new form of valve attachment for singletube tires. The valve tube is bored for containing the operating valve mechanism and has integral with it at the inner end a flange resting on the outside of the tire tube. Within the valve stem is secured a second tube extending through the opening in the tire and ending with a button-headed flange pressing against the inner surface of the tire tube in such a way that when the tire is inflated it is held rigidly between the flange on the valve stem and the other one on the tube within the stem, resulting in an air-tight valve attachment, when there is any air pressure within the air chamber.

Letters patent No. 801,323, dated October 10; to Hubert A. Kiser and Christian P. Anders, Westover, S. D.—The invention is a reversing mechanism for attachment to the drive wheels of motor vehicles. A driving gear wheel is secured to the drive shaft or axle. Inside of this is a gear carrier with pinions mounted thereon in mesh with the driving gear wheel. An internal gear wheel has a pinion connected therewith and motion transmitting connections are used between the pinions and the traction wheels. Means are provided for locking the gear carrier against movement in one direction, and against relative movement along the internal gear in the opposite direction.

Letters patent No. 800,809, dated October 3; to Thomas H. Lindley, of Cedar Rapids, Ia.—The invention is a metal guard for protecting the tread of pneumatic tires. Encircling the tire tread is a narrow metal band, practically as wide as the diameter of the tire. On each side of the metal band are radial arms for seizing the sides of the tire when inflated and keeping the band from slipping on the tire.

Letters patent No. 800,789, dated October 3; to Thomas A. Blakely, of Fleshertom, Ont.—The device is a form of anti-friction bearing in which one circle of long rollers is used. The roller axles are retained at each end in bronze rings held in position by short bushings. The entire bearings are enclosed in an oil tight cage, one side of the rollers working on the axle shaft and the opposite side on a bronze journal.

The Realm of the Commercial Car

TROLLEY REPAIR CAR

STEAM, that, since the day when Stephenson perfected Watt's tea kettle, has been the speed king of the years, is inch by inch being dethroned. From 1830 until 1900, three score years and ten, her reign was one uninterrupted march of progress and conquest, but with the waning years of the nineteenth century, when the demands of transportation were month by month and year by year becoming more urgent, the first rays of the opening day of the gasoline motor were piercing the overhanging canopy of doubt and the east was gradually lighting up with what was soon to be the revolutionizer of passenger transportation.

The gasoline motor that lay in its swaddling garments through the early '70s and '80s until that wizard of the motor, Gottleib Daimler, started it on its glorious march of triumph, has within the last few years grown and developed as steam never did and now verging on the threshold of manhood is fearlessly reaching out to grapple for the supremacy on the thousands upon thousands of miles of steel that for so long have been the undisputed home of the steam engine.

The coming of the gasoline motor as a means of power for railroads is no idle dream, no vain illusion, but a rapidly approaching reality. Fairbanks, Morse & Co., of Chicago, one of the leading railroad supply houses of the country, have commenced in one of their big plants the manufacture of all styles of gasoline motor inspection, section and observation cars for use on any standard railroad line, and report that since the first of the present year they have sold over 500 of these to the leading roads of the country. When such lines as the Erie, Chicago & Great Western, Chicago, Burlington & Quincy, Long Island, Union Pacific and other lines are installing them as fast as they can get them it is ample proof that the gasoline railroad inspection and section car is not an experiment but a practical outfit.

The old way of inspecting a roadbed from a private car, drawn by a special locomotive, with a special fireman, a special engineer, a special brakeman and a special conductor, the whole at a very special price and expense, is being superseded by inspection in a trim gasoline car with seating accommodation for ten or a dozen people and driven by a two-cylinder gasoline motor of 12 or 14 horsepower capable of making 35 miles an hour over good roadbeds with as much convenience as necessary and with the expense absolutely nothing compared with that of a special train.

Perhaps the most novel and little used field of the gasoline car is that for trolley repair work. Every citizen of the smallest town where the overhead trolley constitutes a part of the transportation system, is familiar with the tower wagon, generally hauled around by a couple of horses and requiring a long time to reach a point where the wire has broken down. The gasoline motor trolley wagon runs on the street car tracks and can move along at a speed of 25 miles an hour when the tower is lowered as much as possible, and with it up at its highest, fast traveling is possible because of the little vibration on the steel rails compared with the rocking that the horse-drawn one is treated to. This car is made especially for inspection as well as repair work. It is lightly constructed, so that in case a break occurs and there are several cars on the line between the break and the repair car, the latter can be run close to the street cars and then lifted off the track, the trolley cars backed up until none remains between the tower wagon and the break, when it is lifted back in place.

The car has a single-cylinder water-cooled motor rated at 6 horsepower. By placing the motor and transmission gear close to the front axle the entire back part of the chassis remains open for attaching the tower. The motor generates its normal power at speeds practically the same as every automobile motor, and the transmission of power is through a two-speed and reverse planetary gear transmission carried on the crankshaft. On high speed direct drive is obtained from the motor shaft to the center of the fro axle, a single chain acting as the tra mitting medium, this being identical w automobile construction. This constr tion has been found, by continuous exp ments, to be much better than where motor is geared positively to the dri shaft, in which case when the motor started motion is at once communicated the drive wheels. With the automo connection between motor and dr wheels the control in stopping and st ing as well as the regulation of spee made more delicate and ease of con correspondingly increased.

Gasoline is fed to the motor by a f feed carbureter and the control of t throttle and spark is identical with on the automobile, except in that a st ing wheel is not needed and the thr and spark levers are short finger le working on opposite sides of a horizo circle at the right of the operator.

Ignition is by jump spark, a stan spark plug being placed in the usual tion and connected with dry cell storage battery and a coil. Water co is effected by a gilled tube radiator, in the center of the car above the axle so that the tubes, arranged in zontal rows, are exposed to all air th coming.

The planetary transmission has usual quota of gears running in a bath. Changes in speed are gained thr the use of a lever, with a pedal se for the reverse. The only brakes us a pair of shoes working on the tires o rear wheels and applied either by or lever.

The tower consists of two pa lower half of large size and made of wood or steel and a steel top of the construction made to telescope with

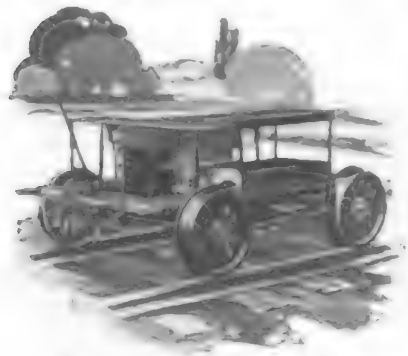
OPEN INSPECTION CAR

bottom part. The top part can be or lowered with little effort. The insulated from the ground by the wooden center wheels.

The most popular railroad car is intended for the use of section gan placing as it does the familiar worked by the passengers. Car made by the Fairbanks concern, much larger than the common hand differs slightly in general lines motor plant is located above the fr and consists of a single-cylinder cooled motor developing 6 horsep

Digitized by Google

1,000 revolutions per minute. In line with the crankshaft is an enclosed, oil-tight, planetary transmission, with single chain drive to the center of the front axle. Two forward speeds and a reverse are provided. The body part is a flat platform with a T shaped raised central seat serving also as a covering for the machinery. On this seat is accommodation for ten



CAR USED BY THE SECTION GANG

workmen and on the footboard is space for carrying their tools. The car can be lifted off the track by four men in case of an approaching train.

For railroad inspection work the same makers offer two styles of machines, one with practically the same power and transmitting system as in the section car, but fitted with four semi-elliptic springs, clipped to seatings on the axle casings and shackled, automobile fashion, to the side pieces of the main frame. In this car the radiator is thrown beneath a slightly inclined dash—another touch of automobile style—the change speed lever is at the right of the driver, as are the spark advance, throttle lever and battery switch. The aim in construction of these cars has been to make them as similar as possible in their control to the present-day motor car. Passenger accommodation for four men is provided, two on a permanent seat in front and two or three on a removable seat on the rear platform. Both seats are upholstered. In case the back one is not needed it can be removed and in its place attached a carrying compartment for baggage. The car is provided with corner handles for lifting off the tracks for passing trains but generally they are run on dispatcher's orders according to regular schedule.

The company's large inspection car is built for nine people and is driven by a two-cylinder 12-horsepower motor, with cylinders mounted vertically beneath the front seat.

The drive is by chain to the front axle with changes of speed gained by a planetary transmisison. The car body has a cross seat in front for the driver and one passenger and facing seats in the rear with room for four on each seat. A canopy top with sliding glass front, glass sides beside the driver and drop curtains for protecting the rear seat passengers are features of it, making it suitable for long-distance work. This machine is adapted to be run on regular railroad schedule and being furnished with special springs can be speeded to 35 miles per hour. In case the rear seats are not needed they can be removed and used for carrying baggage. While built especially for railroad inspection work it is suitable for running on side lines where the passenger traffic does not warrant regular steam service but where little accommodation and more frequent service are the essentials. One of these cars recently made a run from Chicago to Denver and return, covering the 2,011 miles at an average of 29 miles an hour. On the trip all kinds of grades common to railroading were encountered, but the machine mounted them on the high speed.

One feature noticeable in all these cars is the solid and heavy construction, as well as the introduction of good springs for machines running at fast speeds. Every reader is familiar with the jar felt in the palatial Pullman car when passing over crossings and joints at high speed in spite of the spring suspension of the coaches. This occurs, only in a lesser degree, in these gasoline cars and the jar occasioned at 30 miles an hour is sufficient to crystallize axles of the ordinary construction as well as to loosen the piping connection in and around the motor.

AUSTRALIAN SEEKS CARS

About two years ago James Trackson, of Trackson Brothers, Brisbane, Queensland, left that city for the United States and Europe to seek for the most suitable road transports for freight and passengers for Queensland. He spent about 5 months in this country, 4 months on the continent of Europe, and several weeks in England, which country, he states, he found ahead of others in this field. As a result of this visit he purchased six outfits of a steam engine and three trailers, which are now in use in Brisbane, and more are on the way. The enterprise is still in an experimental stage, but the following routes over which the transports are to be run will show the extent of the service: Yeulba to St. George, 129 miles; St. George to Dalby, 304 miles; Warwick to Goondiwindi, 120 miles; Miles to Garoon, 105 miles; Cunnamulla to Thargomindah, 142 miles; Ilfracombe to Isisford, 65 miles; Barcaldine to Muttaburra, 92 miles; Longreach to Winton, 125 miles.

One requirement of motor service of this character is good roads. The engine and freight cars have wheels whose tires range from 6 to 12 inches in width. The speed of motors is from 8 to 10 miles an hour, and they will have a load-hauling capacity of about 10 tons. The engines are run in pairs, one being equipped with wood-sawing machinery for supplying fuel, and also a 30-ton steel hawser, fixed on an emergency drum, to assist in passing creeks and bad places on the road. The exhaust steam will pass into the return boiler tubes to extinguish sparks, so as to minimize risks of grass fires. The engines are of the compound type, work with a pressure of 225 pounds of steam, and are provided with filtering, suction and other apparatus necessary for the class of work for which they are intended. The gearing is in an inclosed oil tank, into which dust cannot penetrate. Fuel in many districts can be easily obtained, but water, particularly during the summer months, will not be so accessible.

After inspecting transports of various motive power, steam, electric, gasoline, etc., Mr Trackson states that he found that steam would best meet the conditions in Queensland. He states that he did not order American-made machines, because they were too lightly built and would not stand the rough roads and wear and tear of the Queensland bush; that until American manufacturers make heavier and more substantial motors they cannot compete with the English manufacturers in selling vehicles for the conditions obtaining in the Australian bush.

Each tractor is built on very heavy automobile lines rather than following traction engine construction. The boiler is placed in front directly above the front

BRILLIE BUS IN CHATEAU THIERRY HILL CLIMB

axle, with a locomotive type of smoke stack rising from the center. The driver sits directly behind this, and slightly to the rear of him and beneath the frame of the car is the motor, furnished with steam from the boiler. The entire carrying platform is used for carrying fuel, either coke, coal, wood or anything that will burn, and water tanks. The back wheels, besides having very broad tires, have cross pieces on each to increase the traction. They are in short traction engine wheels. The trailers are common heavy wagons with wide iron wheels. They are strength personified and couple one to another much as do the ordinary street cars.

TESTED ON CHATEAU THIERRY

October 1, the date of the Chateau Thierry hill climbing contest in France, was especially conspicuous this year in that motor trucks and motor vans competed against one another in ascending the 1-mile hill. In previous years touring cars and racing machines have been the only competitors, but France is now in the commercial game and many makers were on hand with trucks and passenger buses to test the work of their machines. The Chateau Thierry hill is a mile ascent with the grade slightly over 10 per cent in one place. The fast pleasure cars and racers contested over 1 kilometer of the grade, above this point there being too acute a curve to warrant letting the fast machines try it, the condition of the hill not being the best and the danger of accidents being very great. Accordingly, while the fast cars had to be content with a ⅝-mile test, the slower ones, including the trucks, had a chance at the mile climb.

All competitors were given a very short flying start and the Automoto truck, carrying rather less than 3 tons, climbed the hill in 9 minutes 3⅘ seconds. The Aries truck, with a total weight of more than 4½ tons, was 17 minutes 20 seconds in covering the hill; and the Brillie truck with a load of 5 tons of stones got up in 17 minutes 53 seconds. Two motor buses lent by the Paris Omnibus Co., with which they are at present undergoing tests, climbed the hill in magnificent style. The gasoline-electric Krieger bus, with as many passengers as could possibly be crammed into it, climbed the hill in 17 minutes 3⅘ seconds. The Brillo gasoline bus with the same seating accomodation, but slightly lighter in construction, took the 10 per cent grade with remarkable ease in 14 minutes 42 seconds. The driver of this bus gave a free invitation to one and all to mount his vehicle. The natives did not need pressing, and in a few seconds the inside, the outside, the platform and the steps were crowded with joyful rustics. As they got off th bus they were counted and were found t number no fewer than sixty-five. Som twenty were children, but an equally larg number were men of more than ordinar growth. As soon as the day's event were over the Brillie bus returned t Paris by road as it had come 2 days pr viously, covering the 55 miles with th greatest ease, despite a full load of pa sengers and a series of difficult hills.

The construction of all the competin machines was standard in practically a lines. The Brillie bus is a double-deck with rear entrance and stair case to t upper deck, which is protected by canopy. The driver occupies a cross se directly above the bonnet, the foot boar being taken out when examining t motor. A canopy projects over the driv with side and front drop curtains for w weather. Final drive is through doul side chain, the sprockets on the ends the counter shaft being very small. T sprockets, as well as the chains are p tected by a metal covering, excluding m dirt and grit. The body is of Lond omnibus design, finished in white, w broad blue trimming lines. Solid rubb tires on the front wheels and double the rear wheels were fitted during the t but in the Brillie truck flat steel tires circled all of the wheels, those on r being much wider than the the fro On the truck a common draying body w low wooden sides was used. The load this vehicle consisted of large stones.

Compared with the foregoing machin the Automoto truck was of very li construction being practically touring like as far as weight is concerned. has double side chain drive. In the A truck the driver's seat is located dire over the motor, the tube radiator ha beneath the dash, drive is by double chain and solid rubber tires are fit

USING DOUBLE CHAIN DRIVE

The Rapid Motor Vehicle Co., of Pon Mich., manufacturer of commercial chines, has its first 1906 machine on road undergoing tests. The new car fers from this year's machines in the of double chain drive, as well as in m parts relative to the motor and tran sion. The company is having a new l ing erected which it hopes to occup the middle of next month.

BRILLIE TRUCK — THE CHATEAU THIERRY COMMERCIAL HILL CLIMB — ARIES

Commercial Stepping Stones

French Woman Clipping Sheep by Power Clipping by Gasoline Engine

Fast Pace for Bus—The double deck omnibus running over rural routes in England is permitted to travel at a 12-mile gait, irrespective of localities passed through. Going at this rate—when fitted with solid tires and well loaded—there is no serious jar to the machinery, which goes to show the big part played in automobiling by good roads.

Wants Another—The Chicago public library board is asking for proposals from manufacturers for a gasoline delivery wagon to be used in delivering books from the main office to the sub-stations. Already the board is using three air-cooled cars in this work and the fourth machine will, it is expected, be used as a relief one, doing duty when others are being repaired and also in emergencies when breakdowns occur to the ones in service.

Shy On Batteries—The Park Auto Co., of Pittsburg, Pa., which started a line of touring buses 2 months ago, is having considerable trouble with its machines. Only one bus has been secured thus far, although it was expected that two more would be put on this summer. The difficulty is that enough power cannot be generated by the batteries to carry the car full of people over 25 miles and as this distance constitutes about one and a half trips as advertised there is constant caution required on the part of the chauffeur to see that the machine is charged after the first trip.

Spreading in London—The motor bus movement is spreading in London, despite the fact that it is doubtful if any one of the companies engaged in the competition can be showing a profit, if any allowance is made for depreciation. The number of motor buses that worked in 1 week was 130 and at that a fresh batch has just passed the police test—turning inside a 30-foot circle, brakes, etc. The effective life of a motor bus cannot exceed 3 and will probably stop at 2 years, for they are being run 19 and 20 hours a day. As they cost from $4,000 to $4,500, the figures necessary for profitable operation seem easy to arrive at. But nobody appears to have the courage to tackle the problem up for consideration.

Motor Dog Clipper—French poodles and sheep are latest victims of the gasoline engine. In the hot summer months the French dog fancier cares as much for the comfort of his canine as does the average American horseman for his pacer or the devoted automobilist for his 90-horsepower machine. Clipping poodles has previously been done by the tondeur or dog shaver, but the invasion of the motor shaver has commenced and already the tondeur is becoming anxious. The motor shaver is a little two-wheeled gig much like the ordinary popcorn roaster so common in city streets, differing, however, in that a little vertical air-cooled gasoline motor is mounted where the flame in the popcorn gig is located. On the front of the gig is a large flywheel revolved by round leather belt from a small wheel on the end of the crankshaft, and the axle of the flywheel is continued in the form of a flexible shaft, much the same as that used by dentists. On the end of the shaft is fastened a small pair of the ordinary hair cuppers. The sheep or dog is held on the knees of an attendant when a second party, generally a woman, seizes the end of the flexible shaft carrying the clippers and is soon ridding the panting animal of its woolly coat.

Shipping Light Trucks—The Mitchell Motor Car Co., of Racine, Wis., has shipped its first consignment of light trucks to its New York selling agents, the Mitchell Motor Vehicle Co., located at Fifty-ninth street and Broadway. The company has practically completed 50 of these machines and expects to put a great many more through before the opening of the season.

Has Hotel Bus—The Mobile Carriage Co., San Francisco, Cal., has manufactured for the Hotel St. Francis a large passenger bus for use between the hotel and depots. The vehicle follows extended touring car lines rather than common bus construction. The passengers enter at the rear and occupy facing seats. Power is furnished by a vertical motor carried in front with drive by double side chains.

Bad Streets a Drawback—Siegel, Cooper & Co., Chicago, have used a Woods electric delivery wagon in connection with their delivery system for several years. The machine has good carrying space and is used over regular routes. The bad condition of many of the streets in the Windy City has restrained the company from installing several additional wagons, the extra cost of rubber tires being the heaviest expense in connection with the operation of the machine.

Buys Packards—Five 1½-ton trucks have recently been sold by the Packard Motor Car Co., of Detroit, Mich., to the Adams Express Co., for use in New York city. The trucks have the vertical two-cylinder 14-horsepower Packard motor, with friction clutch, sliding gear transmission and double side chain drive. Solid rubber tires are fitted. The company has also shipped this week three other trucks of the same power to Central America to be used on routes between the mines and the coast towns. The Packard concern reports that it has been taxed to the utmost capacity during the entire summer to keep up with orders and is now considerably behind in deliveries.

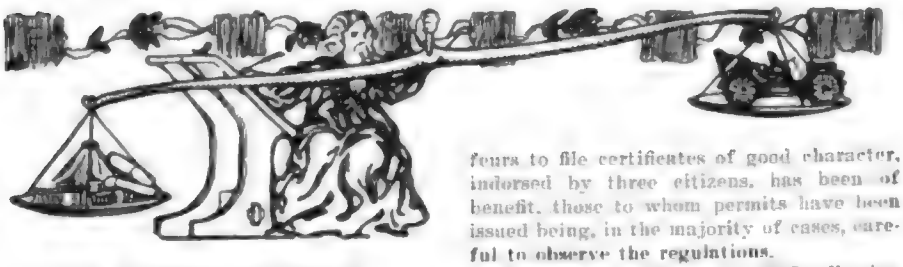
LEGAL LIGHTS AND SIDELIGHTS



TO STOP NUMBER TRANSFERS

The second annual report of the automobile board of the District of Columbia, submitted to the district commissioners Saturday, shows that during the fiscal year ending June 30, 1905, a total of 667 applicants were examined and granted permits to operate automobiles within the district. Automobiles to the number of 468 were assigned identification numbers; numbers were authorized to be transferred from former owners of 168 machines to new owners of the cars when sales of the cars were reported to the board and sixty-eight automobiles from other jurisdictions were allowed touring permits. Detailed figures transmitted with the report show that of the 468 new cars registered during the year 137 were electrics; 393 were gasoline, 109 steamers, while twenty-eight motor cycles were registered during the year.

The board makes a number of recommendations. One of the most important is that which, if enacted into law, will prevent the indiscriminate transferring of permit numbers from one automobile to another. In this connection it is recommended a regulation be passed which will require "that on the assignment of a permit number to an automobile the secretary of the automobile board shall issue and deliver to the owner of such motor vehicle a seal of aluminum or other suitable metal, which shall be circular in form, approximately 2 inches in diameter, and have stamped thereon the words 'Registered motor vehicle, District of Columbia,' with the registration number inserted therein, which shall thereafter at all times be conspicuously displayed on the motor vehicle to which such number has been assigned. Upon the sale of said motor vehicle the vendor shall report immediately such sale and return the registration seal affixed to such motor vehicle, and, further, that all motor vehicles owned and operated in the District of Columbia be required to procure and display such registration seal."

Similarly, to guard against reckless non-owners or chauffeurs, and to render more general a compliance with section 8 of the automobile regulations, which requires operators of automobiles "to exhibit his or her permit to any police officer * * * when demand for such exhibition is made," the board recommends that an aluminum badge hereafter be issued to such non-owners or chauffeurs, the badge to be stamped with the words 'Registered chauffeur, No. ——, District of Columbia,' and to be worn in a conspicuous place on the clothing."

In conclusion the report says: "The regulation requiring professional chauffeurs to file certificates of good character, indorsed by three citizens, has been of benefit, those to whom permits have been issued being, in the majority of cases, careful to observe the regulations.

"The order of March 1, 1905, allowing tourist or non-resident owners of motor cars, who have complied with any law requiring the registration of owners of motor cars in the state, territory or federal district of their residence and the registration number showing the initial of such state, territory, etc., to register the description and designation numbers of their motor cars, giving temporary address in the District of Columbia and their home addresses with the secretary of the automobile board, thereby entitling them to operate such registered motor car in the District of Columbia for a period of 60 days, has been very favorably commented on by everyone who has registered."

LONG ISLANDERS' TROUBLE

The Suffolk county, Long Island, authorities having by their withdrawal of the reward to sleuths, ceased their persecution of automobilists, the men who constitute the Islip town board have devised a plan that promises to make some trouble for owners of the horseless vehicle. The town board has adopted a resolution providing that when arrests are made by the deputies and constables the town will pay the cost of prosecution. Since the $25 reward was taken off by District Attorney Smith, the local sleuths have not been as active, and as a result few, if any, arrests of automobilists have been made. While the town board seems anxious to make life a burden to touring automobilists, it is believed the resolution will not cause any great activity on the part of the deputies, for the reason that there is no incentive for them to make arrests when only the legal fees and costs are paid. With a reward of $25 for each conviction it was different. So far as is known there have been no flagrant violations of the speed law, and no reason for the town board's action seems to exist.

NEW JERSEY CASE

S. W. Rushmore, of the Rushmore Dynamore Works, of Plainfield, N. J., announces he will take an appeal from the decision of a jury in Justice John Franklin Fort's court at New Brunswick, N. J., which brought in a verdict for $500 for, as he alleges, the loss of a bicycle, a slightly cut finger and a week's wages of a workman who crashed into the 12-horsepower Packard Mr. Rushmore was driving. It is also asserted by Mr. Rushmore that the justice, in his charge to the jury, said that while "at times the rider of a bicycle or horse-drawn vehicle must cross to the left side to avoid accident or to pass a slower or stationary vehicle going in the same direction, there was no such law permitting an automobile to so pass to the left." It is also claimed by Mr. Rushmore that the justice added that "if you find that the plaintiff was, as he had a perfect legal right to be, on the right side, then you must find for the plaintiff."

As stated by Mr. Rushmore, the facts in the case are as follows: "On May 28 I was driving a 12-horsepower Packard car along Richmond street, Plainfield. The street was obstructed on the right side and a large, slowly-moving truck on the car tracks in the center made it necessary for me to pass to the left. As I was turning to the right side again I saw two bicyclists coming toward me and I signaled with my horn. Both riders looked up and the first rider, becoming confused, turned to his left. I quickly turned to the left again and safely passed the first rider. The second rider, thinking I had continued, passed over to the right and kept on at top speed. He had his head down and was looking backward at a lot of men who had just been paid off at the Scott Press Works and were calling to him. I signaled again and noting that a collision was inevitable, I jammed on brakes and threw the car to the right, stopping in its own length and directly at right angles to the street. After the car came to a full stop the wheelman ran head-on into the side of the rear wheel. He was thrown off and his wheel smashed. He got into the car with me and I took him to the doctor's office. His finger had been cut on the steel fender and I tied it up with my handkerchief. After leaving him at the doctor's I went to the man's house and explained the accident to his wife. I did not admit any responsibility, but recognizing the man as one who had worked in my shop, I offered to repair his wheel and pay his wages while his hand was disabled. The man was back to work in a few days and brought suit for $1,000."

KANSAS CITY LAW INVALID

In Kansas City, Mo., the city ordinance regulating the speed of automobiles and providing various regulations concerning them and providing for the examination and licensing of automobile operators, has been declared unconstitutional by Judge Brumback of the circuit court, and a temporary injunction issued enjoining the city authorities from enforcing it.

Another city ordinance, providing for the taxing of automobiles, was declared constitutional, and it will be enforced. The validity of both ordinances was attacked by the Kansas City Automobile Club, and an injunction was asked to prevent the enforcement of them. The taxing ordinance was attacked because the charter provides for the city taxation of carriages and vehicles, but does not mention automobiles. Judge Brumback held that automobiles might fairly be considered to be included in the word "carriages" in the charter, as no mention of motive power was made in the charter.

Judge Brumback held that certain provisions in the other ordinance were unreasonable, oppressive and unconstitutional, in not affording equal protection of law, but, he held, the city had authority to pass an ordinance that would regulate automobiles, and that would be constitutional. That feature which provided

Digitized by Google

the examining of operators was unjust, because the board of licensing examiners was not composed of persons having any skill to judge of the qualifications of operators, and for the further reason that the ordinance does not distinguish between the operators of steam, gasoline or electric machines. The opinion of Judge Brumback says:

"The examination provided for does not distinguish between them and the board may require a person desiring to operate an electric automobile to pass an examination upon a steam engine, or vice versa, as but one kind of license is provided for, and another person who, by the favoritism of the board, may be examined upon an electric automobile, which requires simply knowledge enough to steer it, may, by virtue of his license, run a high-power, dangerous machine of another character. I cannot regard any such arrangement as affording any reasonable protection whatever to the public.

"I cannot agree with the contention of counsel for plaintiff that the city has no power to require operators to qualify. I consider it plainly apparent that high-power and high-pressure vehicles operated by the dangerous agencies of gasoline and steam or high-speed vehicles operated by electricity are sources of danger in the hands of persons not properly trained and that skill and experience may properly be required of operators thereof."

About the provision which requires the operator of an automobile to stop when demanded by the driver of a horse the court said:

"It makes a person lawfully entitled to the use of a highway subject without appeal to the whim and caprice of some other person."

The court says further:

"The provision of the ordinance that upon any accident happening it shall be the duty of the operator of the automobile to come to a full stop and give the owner or person injured or persons in charge of the vehicle a card with his name, license and number written thereon, appears to me to be a plain attempt to make a person a witness against himself, and is therefore unconstitutional."

CALLS ILLINOIS LAW O. K.

The supreme court of Illinois has ruled that the statute passed in 1903 is valid. It provides that a speed not to exceed 15 miles an hour may be taken on the country roads. The statute further provides that it is the duty of the motorist to bring his machine to a full stop on approaching a horse or team that shows signs of fright. The case that was passed on by the supreme court went up from Mercer county. A team of mules was frightened and dumped the occupants of the buggy. The owner of the mules was hurt somewhat and he sued for damages, getting a verdict of $1,250. The automobile was not brought to a stop in that case. The case is Christy versus Elliott and appears in the Northeastern Reporter, volume 74, page 1035. All possible questions touching the constitutionality of the statute were raised. The supreme court goes exhaustively into the case and firmly upholds the statute in every particular. The court holds that not only must a driver bring his car to a stop on the roads when a horse frightens, but he must use diligence in discovering whether or not a horse frightens. The reasonableness of the statute is supported under the police power of the state. It was claimed this statute amounted to class legislation, being something that was aimed only at owners of automobiles. The court utterly refused to take any serious interest in that contention. The same statute further provides that a driver may be fined and imprisoned in the county jail for running to exceed 15 miles an hour, or for failure to bring his machine to a stop when a horse frightens.

MOTORPHOBIST SETTLES

The much talked of case at Racine, Wis., in which Ernest Kell, a Caledonia farmer, was fined $25 and costs for assaulting Sam Hanson, chauffeur for Dr. C. I. Shoop, with a pitchfork and afterwards made the defendant in a $1,000 damage suit brought by the injured man, has been settled by Kell's paying Hanson $100 and the costs of the case, no inconsiderable amount. The assault aroused the ire of motorists.

BRIEF BUSINESS ANNOUNCEMENTS

Nashua, N. H.—H. C. Lintott has the agency for the Reo cars.

Portland, Ore.—Ballou & Wright, 86 Sixth street, have been appointed local agents for Morgan & Wright.

Peoria, Ill.—Work has begun on the buildings of the Illinois Automobile and Parts Co., at the corner of Main and Globe streets.

Youngstown, O.—Walter P. Flynn, a manufacturer of automobiles here, recently visited Bay City, Mich., in search of a site for a new factory.

Detroit, Mich.—Benjamin Webster, formerly of Boston, has opened an exchange at 251 Jefferson avenue and will handle the Welch. He will also conduct a repair shop.

Evansville, Ind.—The Windsor Motor Car Co. has been organized here for the purpose of manufacturing automobiles. Evansville and Chicago capital is interested in the plan.

Pittsburg, Pa.—The Hardy Automobile Co. is closing out all its machines at its garage at 529 Second street, Allegheny, where it has been handling medium classed cars the past year.

Fort Worth, Tex.—A. B. Wharton and W. W. Sloan, Jr., are soliciting support for a garage here, it being proposed that the new company buy out the business of the Wharton and Childress garages.

Springfield, Ill.—The new garage of the Quincy Automobile Co. will be built on South Fourth street, just opposite the woolen mills and will be 60 by 175 feet and one story high.

Madison, Wis.—The E. W. Arbogast Motor Co., of Waunau, has filed a resolution of dissolution.

LATE INCORPORATIONS

Boston, Mass.—The Greendale Gas Engine Co., of Worcester, has been incorporated with a capital stock of $15,000.

Boston, Mass.—The Teele Automobile Supply Co. has been incorporated with a capital stock of $10,000.

Albany, N. Y.—The Auto Exchange of Albany has been incorporated to manufacture and deal in automobiles. Capital stock, $5,000.

Waco, Tex.—The Waco Auto & Electric Co., of Waco, has been organized with a capital stock of $5,000.

Cleveland, O.—The Standard Automobile Co., of Cleveland, has been incorporated for the purpose of manufacturing automobiles. The capital stock will be $10,000.

New York—The Automobile Buyers' Association, of New York city, has been incorporated with a capital stock of $10,000.

New York—The Austin-Carmack Engine Co., of New York city, has been incorporated with a capital stock of $5,000.

New York—The Hudson Automobile Co., of New York city, has been incorporated with a capital stock of $5,000, to manufacture and deal in automobiles.

New York—The Central Park Automobile Storage Co., of New York city, has been incorporated with a capital stock of $40,000. The company is to engage in the storage of automobiles and other vehicles, and will conduct a garage.

Lansing, Mich.—Articles of incorporation have been filed by the Auto Lorgnette Co., a corporation established for the purpose of manufacturing and selling face protectors and other goods. The capital stock is $3,000. The stockholders are John H. Himes, Augustin Hendricks and Gertrude Hendricks.

Buffalo, N. Y.—The Kilgore Automobile Air Cushion Co. has removed to 46 Columbus avenue, Boston, which is now to be the main office of the company.

New York—Underhill & Mathews have leased 1843 Broadway for Peter Vogel to the St. Louis Auto Car Co., which will use the premises as a garage.

Boston, Mass.—Allen G. Stillman, formerly with the Pope company, has become associated with J. H. McAlman in the local branch of the Locomobile company.

Springfield, O.—The King Mfg. & Garage Co., recently incorporated, is looking for new quarters. The company is engaged in the manufacture of automobile tops.

San Francisco, Cal.—The Chanslor & Lyon Motor Supply Co. has opened here a branch of its Los Angeles establishment and will carry a full line of parts and accessories.

Pittsburg, Pa.—A permit has been granted by the building department to the Pittsburg Motor Vehicle Co. for the erection of a one-story frame factory on Summerlea street to cost $6,000.

Philadelphia, Pa.—John Draper, one of the potent factors of the old champion Kelly-Draper tandem bicycle team, will in future look after the wholesale business of the Thomas B. Jeffery Co. in Philadelphia.

Boston, Mass.—The Butler Motor Co., of Boylston street, will handle during the coming season the Rapid Vehicle Co.'s commercial vehicle. The company handles the Cleveland and Pierce-Racine.

OFFICERS

ISAAC B. POTTER, President, Potter Building, New York.
CHARLES E. DURYEA, First Vice-Pres., Reading, Pa.
W. GRANT MURRAY, Second Vice-Pres., Adrian, Mich.
S. W. MERRIHEW, Third Vice-Pres., 154 Nassau St., New York.
FRANK A. EGAN, Secretary, 132 Nassau St., New York.
FREDERICK B. HILL, Treasurer, 32 Binford St., Boston.

National Headquarters
Vanderbilt Building, New York

THIS LEAGUE
Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the cooperation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

APPOINTMENTS MADE

The following named members have been added to the list of local consuls: C. J. Lord, Cando, N. D.; Dr. J. R. King, Braddock, Pa.; James E. Glass, Pittsburg, Pa.; Thomas McK. Cook, Pittsburg, Pa.; W. B. Deshon, Pittsburg, Pa.; Henry Wittmer, Pittsburg, Pa.; W. W. Coleman, Swissvale, Pa.; H. E. Grant, Pittsburg, Pa.; D. F. Henry, Pittsburg, Pa.; Cecil Robeson, Albany, N. Y.; J. J. Kirke, Brooklyn, N. Y.; Nelson Hartsell, New York; Mark M. Trebert, Cincinnati, O.; A. B. Browne, Cleveland, O. Of the members above named those residing at Pittsburg, Pa., together with Messrs. Coleman, of Swissvale, and King, of Braddock, are members of the Pittsburg board of consuls.

OFFICIAL HOTELS

The following official hotels have been added to the list recorded at League headquarters. These hotels have been selected from a list recommended by different touring members of the A. M. L. and the secretary is glad at all times to receive information respecting different inns, hotels, restaurants and road houses which bid for the patronage of touring motorists. Such information is always treated in confidence, and the name of the informant is in no case disclosed. Official hotels are not required to allow a discount to A. M. L. members but are under contract to furnish clean, comfortable and hospitable quarters and good service. Failing in this the official appointment is promptly canceled. It is the effort of the league to maintain on its official list only those hotels which are the best in their separate localities. Following are the appointments mentioned: Lakeville, Conn., New Wononsco; Bretton Woods, N. H., Mount Pleasant; Poultney, Vt., Lake-View-in-the-Pines; Northampton, Mass., Norwood; Springfield, O., Bookwalter; Lakeville, Conn., Interlaken Inn; Warren, Mass., Hotel Ramsdell; Palmer, Mass., Converse house, and the New Hotel Burns; New Preston, Conn., Hopkins place; Chicopee, Mass., Columbian hotel; Weekapaug, R. I., Weekapaug inn; Far Rockaway, N. Y., Hotel Manhattan; Lee, Mass., Morgan house; Harvey's Lake, Pa., Rhoads' Lake; Oradell, N. J., Hotel Delford; Springfield, Mass., Worthy and Cooley's; Colebrook, N. H., Monadnock house; Gloucester, Mass., Colonial Arms; Stony Brook, Conn., Three Elms house; Chester, Mass., Riverside inn; Coatesville, Pa., Hotel Taylor; Hackettstown, N. J., Hotel Clarendon; Northampton, Mass., Draper; Boston, Mass., Hotel Victoria; Hackettstown, N. J., American house; Dingman's Ferry, Pa., High Falls hotel; Islip, N. Y., Islip Lodge; Rockville Center, N. Y., Knickerbocker. Additions to this list will follow.

STATE DIVISIONS

In the formation of state divisions, under league constitution, each state division will be controlled by a board of officers elected by the members at large and to facilitate the election of representatives each state is divided into separate districts. Pending the time when each state will adopt its own constitution and by-laws a tentative division into districts has been made in several of the most important states and these districts will each embrace several counties. The various districts in each state and the counties comprised in each district will be announced in these columns from week to week, or will be sent by circular announcement to the members in the various states.

The Maine Division—District 1 will comprise the counties of Washington, Hancock, Aroostook, Penobscot, Piscataquis and Somerset. District 2, counties of Waldo, Knox, Lincoln, Kennebec and Franklin. District 3, counties of Cumberland, Androscoggin, Oxford and York.

The New Hampshire Division—District 1, counties of Coos, Grafton, Carroll, Sullivan, Belknap and Merrimack. District 2, counties of Strafford, Rockingham, Hillsborough and Cheshire.

The Vermont Division—District 1, counties of Franklin, Orleans, Essex, Lamoille, Chittenden, Caledonia, Grand Isle and Washington. District 2, counties of Addison, Orange, Rutland, Windsor, Bennington and Windham.

The Massachusetts Division—District 1, county of Suffolk; district 2, county of Essex; district 3, Middlesex; district 4, Norfolk; district 5, counties of Bristol, Plymouth, Barnstable, Dukes and Nantucket; district 6, counties of Worcester and Franklin; district 7, counties of Hampden, Hampshire and Berkshire.

The Rhode Island Division—District 1, county of Providence; district 2, counties of Bristol, Kent, Newport and Washington.

The Connecticut Division—District 1, county of New Haven; district 2, counties of Fairfield and Litchfield; district 3, counties of Hartford and Middlesex; district 4, counties of New London, Tolland and Windham.

The New York Division—District 1, county of New York; district 2, counties of Kings, Queens, Suffolk, Nassau and Richmond; district 3, counties of Westchester, Putnam, Rockland, Orange, Sullivan, Ulster, Greene and Dutchess; district 4, counties of Albany, Schoharie, Schenectady, Montgomery and Fulton; district 5, counties of Rensselaer, Columbia, Washington, Saratoga, Warren, Essex, Clinton, Franklin and Hamilton; district 6, counties of St. Lawrence, Jefferson, Lewis, Herkimer, Oneida, Madison and Otsego; district 7, counties of Delaware, Browne, Tioga, Tompkins, Cayuga, Chenango, Cortland, Onondaga, Chemung, Schuyler, Seneca, Wayne and Oswego; district 8, counties of Steuben, Yates, Ontario, Allegany, Wyoming, Livingston and Cattaraugus; district 9, counties of Monroe, Orleans, Genesee and Niagara; district 10, counties of Erie and Chautauqua.

Further announcements, covering the states of New Jersey, Pennsylvania, Delaware, Maryland, Ohio, Indiana, Michigan, Iowa, Illinois, Wisconsin, Minnesota and Missouri are being prepared and will follow, in these columns, from week to week. When all this work has been completed the league can go ahead in its scheme for the completion of a powerful organization that will work for the good of motoring. The officers of the A. M. L. have received every encouragement in the advancing of their work and it is expected that the board of officers in each division will show an active interest in the work.

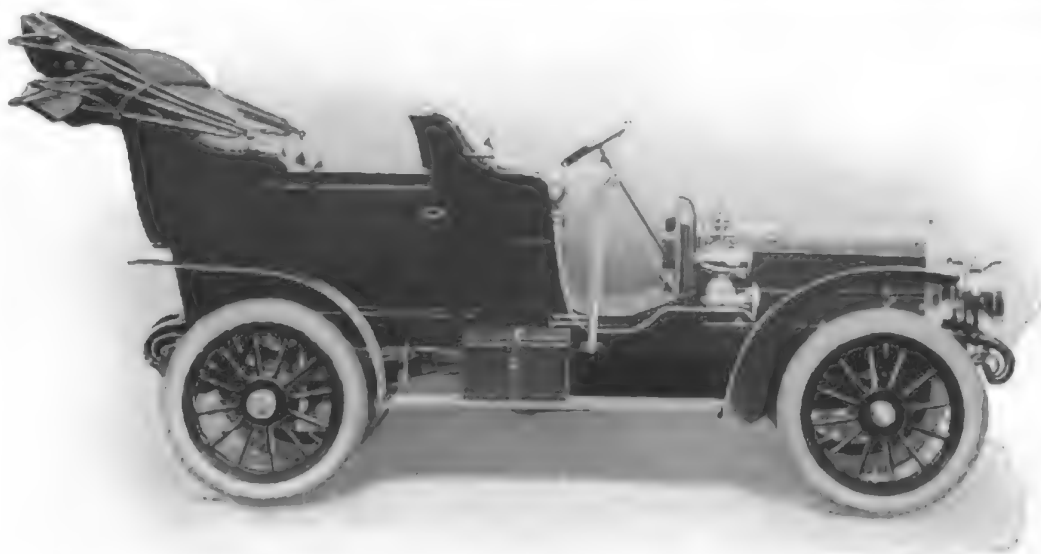
WINTON



Up-Keep, Flaws in Material, and Safety

No human being, no matter how expert, can tell by **looking** at a piece of metal whether it has a flaw in its center.

But every flaw is always discovered—sooner or later—when the metal is subjected to **strain.**

Perhaps **you** discover the flaw when a break occurs miles from home. That compels you to come back by train, to have the car towed in, and to buy new parts to replace those broken. **Three different expense items** all at once. And all due to **one** flaw—perhaps a small one—that the automobile maker **didn't know was there.**

And there's no telling how often during a season these breaks may occur. But every time they do occur, your **expenses increase** and your **enjoyment decreases.** There is no pleasure in using a motor car that eats into your bank account for **breakages** and is likely at any time to leave you **stranded** away out in the woods.

But there is pleasure in using the **new Winton Model K.** And safety, too. No repair bills, no tow home, no coming back on the train because of flaws in material.

Because we **do not guess** that our material is flawless. We **know** it. For Winton Model K material is **severely tested before we put it into the car.**

We use a Riehle Testing Machine that exerts a strain up to 200,000 pounds (100 tons) to the square inch. And any material that withstands our test **will never break** under lighter strains **on the road.**

The time to discover **flaws** in material is **before** that material gets into a **motor car.** Not when carrying a load of **precious human life.**

If you recognize the truth of that statement, your next car will be a Winton Model K, whose material is **tried and tested.**

Winton Model K—Four cylinder, vertical, water-cooled. 4¾ inch bore, 5 inch stroke. Individual clutch transmission. Winton Air Governor. Best systems of lubrication, ignition and carburization. $2,500 f. o. b. Cleveland. Catalog No. 2 is ready.

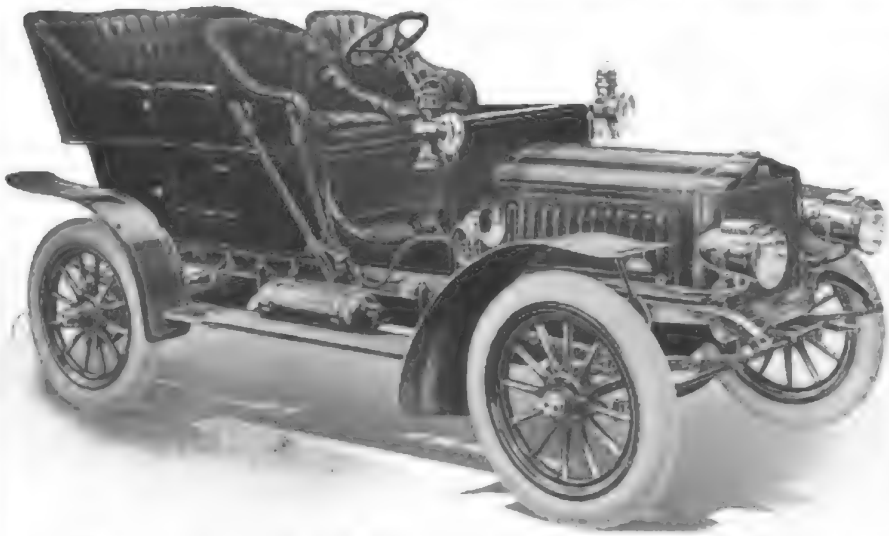
MITCHELL

"THE CAR YOU OUGHT TO HAVE AT THE PRICE YOU OUGHT TO PAY"



Model 4 B.

4-cylinder vertical motor.
18-20 H. P. actual.

No radical features, just a good, substantial, common sense and thoroughly tried out car that has made good in every particular.

Embodies the best features of the most famous cars—but is vastly different in at least one essential —price.

$1500

Correspondence with hustling dealers in each city solicited. We have commenced deliveries on

1906 MODELS

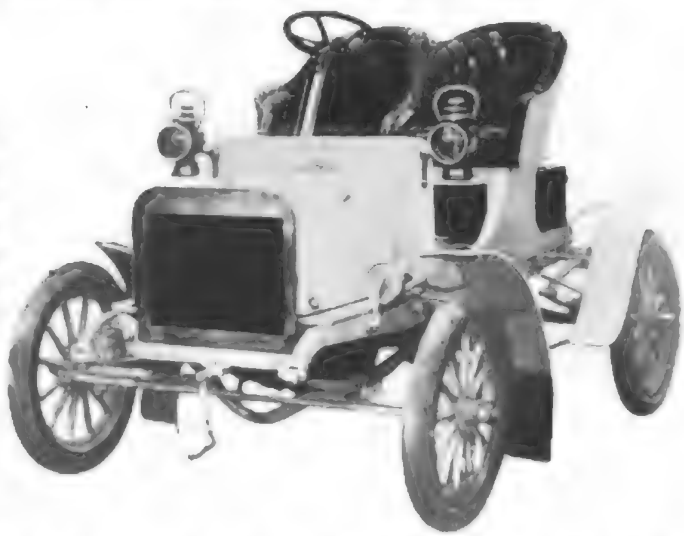
Considerably improved in appearance, and several valuable features added, but no pronounced changes in the construction of either model, as the success of both has been too decided to warrant it.

Model 2 B.

2-cylinder vertical motor, mounted in front.

No car at any price surpasses this magnificent Runabout in style, smartness of appearance or up-to-dateness. It is as carefully designed as any $3000 or $4000 car in the world, has ample power for every condition of road, climbs hills with perfect ease. Its hill climbing abilities are absolutely dependable.

$750



Write for 1906 catalog—the handsomest ever issued.

TYPE D—1906 MODEL

The High-Class High Power Standard
5 passengers 20 "Franklin horse-power."
4 cylinders. Air-cooled. 3 speeds and reverse. Shaft drive. Wheel base 100.
Weight 1800 pounds. 40 miles an hour.
Price, $2800.

"FRANKLIN HORSE' POWER

"What's 'Franklin-power?'"
Horse-power, plus.
"Plus what?"

Many things:—Refinements, construction and design that put every ounce of power to work at the rear wheels; lightness, strength and springs that translate it into high speed and make it available on all roads—safe both for the passengers and the car.

"Franklin horse-power" is the kind that, put into one end of the problem, comes out at the other in a continuous mileage under all sorts of conditions and all through the year—which cannot be approached by cars of anywhere near their power-rating and price, and is seldom surpassed by any cars at any price.

Take the new 1906 Model D car shown above for example: No other car of any rating will carry five people farther, or easier in a day or a year on American roads. No car will carry them for so small an expense both first and last.

Franklin cars are built in every part of the best material for its particular purpose, which can be put into a car, without regard to cost. They cost 50 per cent more per pound to build than any other make of car, but cost far less to maintain and operate.

What they do and the money they do it for, makes them the most economical of all cars.

Four great models for 1906. Send for the book which describes them all.

ANNOUNCEMENT

The 1906 Rainier

30-35 H. P.

has arrived. Come and inspect, ye automobile experts—you who really appreciate beautiful workmanship and design, and you will admit that at last THE American automobile has come. Look over the following specifications, then call and try the car:

Engine—30-35 H.P., 4-cylinder, water-cooled.
Ignition—Sims-Bosch Magneto. Make and break spark.
Transmission—Sliding train, 3 forward and one reverse.
Rear Axle—Bevel gear drive, clutch driven hub, ball bearings.
Front Axle—I beam section, ball bearings.
Frame—Cold rolled pressed steel, aluminum under-bonnet covering entire engine and transmission.
Wheel Base—104 inches.
Wheels—Imperial whalebone, grade A; 2d growth hickory.
Tires—Continental, 34x4.
Valves—Mechanically operated, inlet and exhaust interchangeable.
Carbureter—Float feed, requiring no adjustment.
Body—Full aluminum, double side entrance.
Brakes—Two internal expansion, dust protected, operating on rear hubs through emergency lever holding either forward or backward. Foot brake operates on propeller shaft. Both brakes phosphor bronze against steel.
Equipment—Two headlights, 2 side lights, 1 rear light, 1 horn.

Price, $4,000

The 22-28 h. p., which was the hit of the season in New York, will be continued as heretofore without any changes. 4-cylinder, 98-inch wheel base, La Coste coil, French battery, Continental tires, aluminum side door body.

Price, $3,500

Both models guaranteed free of repairs for one year. The world's broadest and most liberal automobile guarantee.

Landaulet bodies for immediate delivery. Limousines for October and November delivery.

ANYONE CAN BUY CAST IRON AT TWO OR THREE CENTS A POUND AND MAKE AS BIG AN ENGINE AS HE HAS A MIND TO—AN ENGINE SO BIG THAT HE CAN AFFORD TO LOSE HALF OR THREE-QUARTERS OF HIS POWER BEFORE IT REACHES THE WHEELS AND STILL HAVE PLENTY LEFT

BUT it requires skill and skill of a very rare order to take a car of reasonable size, equipped with an engine of ordinary capacity, and so refine and improve its various parts, eliminating a little friction here and there, proportioning a water jacket or valve passage a little better, trimming a little weight all along the line, stiffening some part that springs and binds a wee bit in operation, reducing things generally to simpler forms, and finally producing a car that not only does all that it is expected to do, but some things that the big car *can't do*—avoiding tire trouble for instance—turning around in narrow roads, etc.

Now this is just what the designers of the Stevens-Duryea have done—they took the best known type, the most up-to-date car, and beginning where others had left off, they refined it. They decided that a loss of 30 to 50 per cent of the engine power before it reached the wheels was too much; they succeeded in reducing this loss to 10 per cent. They figured that if bicycles and buggies could be made strong without being made heavy, so could an automobile. They believed that lots of the sins charged to tires were really up to the automobile. They took each part and gave its size, weight, and functions careful consideration—some parts they made heavier—some they made lighter—and everywhere they cut down friction. The result—well, there is nothing in this country the size of the STEVENS-DURYEA that can touch it for speed or power on hills—nothing of its size that weighs its weight—nothing in the history of the automobile business that gets so great a mileage out of its tires—nothing that is as easily operated—nothing that will stand as much knock-about work on all sorts of roads with so little repairing.

These results come, not from good material nor good workmanship alone, but from a new, original, patented system of construction which is so far-reaching in its effects that we have given it a very complete exposition in our new booklet. The way these results were secured makes interesting reading and we'll be glad to send you a copy.

Pope Manufa

HART

1906 ANN

Pope-Hartford, Model F

Four Cylinder 20-25 H. P. Price $2,500

It is conceded by every one that the POPE MANUFACTURING COMPANY has never had the reputation of making extravagant claims for its product. Generations of special training in the famous Factories of Hartford have developed mechanics who are masters of every feature of fine machine work and with the world's best mechanics and the best talent it is possible to procure we have by experimenting, trying, testing and improving, counting nothing too small to receive attention and nothing too great to be attempted, produced our new MODEL F which cannot be excelled at anywhere near the price for quietness, speed and hill-climbing qualities.

Motor Four-cylinder vertical water cooled engine with all gears encased, the cylinders cast in pairs with integral heads and water jackets, developing under brake test 28-30 H. P. Valves located in the head all mechanically operated and interchangeable. Cylinders and pistons made of special stock and ground to a mirror finish thus insuring perfect compression. Crank shafts of special treated nickel steel with liberal bearings. Crank case supplied with two large hand holes on the right hand side of the case through which every bearing on the crank shaft is accessible.

Ignition Jump spark, combined commutator and secondary distributor located between the second and third cylinders and driven from the cam shaft through a pair of spiral gears with a single coil controlled by a lever located on top of the steering wheel but not revolving with the wheel.

Lubrication The lubrication of the engine bearings and cylinders is from a special oiler located on the dash driven by a belt from the cam shaft. The bearings of the transmission are provided with ring oilers running in individual wells at the ends of the shaft, and the transmission gears, bevel gears and differentials run in oil. (The oiling of these parts is referred to more particularly under their special headings.) All parts of the car not lubricated in this way or by splash are provided with oil or grease cups wherever necessary.

Transmission The transmission is of the sliding gear type having three speeds ahead and reverse and is enclosed in an aluminum case with an aluminum cover which is readily removed for inspection purposes. The gears are all made of special steel hardened. The countershaft has three large bearings substantially bolted into the case and without any opening through the ends of the case. All bearings are of special grade phosphor bronze and the gears and bearings with the exception of the front and rear main bearings are immersed in oil, the front and rear bearings being lubricated from two oil wells in the bearing case, the oil being carried by a ring to the shaft. The gears shift by a l located on the right hand side of the seat, operating throug and pinions, a rack on the inside of the gear case bein connected with the sliding gears, the thrust at this point b up by a substantial ball thrust bearing.

Carburettor The carburettor is of special desi our own manufacture, very flexibl cient running from 150 R.P.M. to 1600 R.P.M. and u economy of fuel consumption. Carburettor throttle is co a lever located on top of steering wheel and not revolving

Control Controlling levers for ignition and throttle on top of the steering wheel engaging wi sector arranged so as not to revolve with the steering gears changed by one lever located within easy access of t

Drive A compensating joint is located between the transmission, and the drive from the tran through a longitudinal or propellor shaft having univers either end through a pinion and bevel gear to the rear a joints are so arranged that all bearing surfaces are lubricated at all times. All parts of the joints and shaf of special high carbon steel with liberal pins which work i phosphor bronze bearings.

Front Axle The front axle is a solid forging steel having forked ends to receive The axle is of exceptional strength and extremely graceft

Rear Axle The bevel gears driving the rear axl a pinion meshing with a gear, bot pinion being made from special steel, the pinion shaft integral with the pinion and runs in two Timkin roll The rear axles proper or driving shafts have squared fit in square holes in the differential gears insuring stron ble construction. The shafts are securely keyed and loc outer ends in the wheel hubs and do not carry the w car but are solely power transmitters, the case and outer axle carrying the weight of the car. The thrust of the gear is taken up by a large ball thrust bearing suitabl by hardened steel washers and supported by the main be case.

Steering Steering mechanism consists of worn enclosed in a case packed with gra and is strictly irreversible. Steering joints provided buffers to relieve road shocks.

Brakes The car is provided with two sets of br external clamping band brake faced with belting and acting on a drum attached to transmission at the rear of the transmission case. The other set co internal band brakes which are also faced with camel's

Digitized by Google

ıring Company

.D, CONN.

POPE Hartford AUTOMOBILES

UNCEMENT

and act in drums which are bolted to each rear wheel hub. The brakes are all of ample proportion and of strong and powerful construction, either one of them being capable of locking the wheels with a very slight pressure on the foot levers.

Frame The frame is composed of armoured ash side pieces 1 5-16 by 4 inches at the centre. The armour consists of steel plates 3-16 inch thick securely bolted to the side pieces after all the riveting, which is done hot, is completed. The sub-frame which carries the engine is made of channel steel securely riveted to steel cross members at either end.

Hood and Guards Hood of improved design opening from both sides. Guards of special design, front guard large and flaring.

Body The body is of new and graceful design seating five people, with non-removable dust-proof tonneau with double side entrance especially easy of access.

Dash This is of curved sheet steel reinforced with wood, finished in natural color and surmounted by a brass rail.

WHEEL BASE Wheel base is 98 inches and the tread 56 inches.

Wheels 32x4 front and rear with ball bearings of large dimensions.

Tires We will adopt for our regular equipment what we determine to be the best tire on the market from actual tests we are now making.

GASOLINE CAPACITY 15 gallons.

WATER SUPPLY 5 gallons.

EQUIPMENT Full set of lamps, horn, tools and floor mats.

Pope-Hartford, Model G

Two Cylinder 18 H. P. Price $1,600

Motor Two-cylinder horizontal opposed, located cross-wise under the hood with integral heads and water jackets, developing under brake test 20-22 H. P. Automatic admission valve and mechanical exhaust. Cylinders and pistons made of special stock and ground to a mirror finish as in the Model F. Crank shaft of special treated nickel steel with bearings of liberal size.

Ignition Jump spark from two sets of dry cell batteries carried under front seat.

Lubrication Engine bearings and cylinders are lubricated by a special oiler located on dash driven by a belt from the cam shaft. The bearings of the transmission are provided with ring oilers running in individual wells at the ends of the shafts. The transmission gears, bevel gears and differentials run in oil. In addition to this there are oil and grease cups provided wherever necessary.

Transmission The transmission is of the sliding gear type and identical with the transmission used on our Model F.

Carburettor The carburettor is of entirely new design of the float feed type very simple and very efficient and flexible.

Control Spark and throttle levers located on top of steering wheel. All gears changed by one lever located within easy access of the driver.

Drive The drive is through a longitudinal or propellor shaft having universal joints at either end through pinion and bevel gears to the rear axle.

Front Axle The front axle is a solid forging of special design with forged yokes and exceptionally strong in all its parts.

Rear Axle The rear wheel axle is of solid steel running on ball bearings in a tubular sleeve and of same style and construction as Model F.

Steering Wheel operating through worm and sector. Strictly irreversible, joints provided with spring buffers to relieve road shocks.

Brakes Two sets of brakes, one an external hand brake acting on a drum attached to transmission shaft at rear of transmission case; the other set consists of two internal band brakes acting on drums bolted to each of the rear wheels.

Frame The frame is composed of ash armoured with steel plates securely bolted after all riveting, which is done hot, is completed. The sub-frames and cross members are of steel making a very strong and flexible frame.

Hood and Guards Of improved design constructed of steel, front guard large and flaring.

Body Of graceful design seating five people, double side entrance type with non-detachable tonneau.

WHEEL BASE 88 inch, tread 56 inch.

Wheels 30x3½, front and rear, with ball bearings of large dimension.

Tires We will adopt for our regular equipment what we determine to be the best tire on the market from actual tests we are now making.

GASOLINE CAPACITY 11½ gallons.

WATER SUPPLY 4 gallons.

Equipment Two side oil lamps, two head light brackets, full set of tools and floor mats.

THOMAS 1906

A Personal Statement from Mr. E. R. Thomas

"Hitch Your Wagon to A Star"

My friends have long known that it has been my cherished ambition to build the best car in the world or, at the very least, one of the greatest.

I do not mean the fleeting reputation gained by enormous outlays for advertising and the performance of road and racing stunts by highly paid employees with special cars or well groomed individuals of social and business prominence always accompanied by factory experts. But I do mean the permanent reputation founded by actual performance in the hands of the general public which comes solely from intrinsic merit.

Years ago—surrounded by noted mechanical talent—we built one of the greatest bicycles of the world, which was better than any foreign continental production. The principles of automobile construction are the same except mechanical power is substituted for human. Since 1897 I have been building vertical gas engines by the thousands. Then why not at least one of the best automobiles?

I knew that with us it was only a question of design, material and time. It was not a question of experience in fine workmanship. We had that. Nor was it a question of profit for that would surely follow.

In 1904 daylight began to appear. Two cylinder vertical motors were the vogue. I went one better and built three at the same price. It was far superior to any two cylinder proposition on this side of the world or the other.

Design was greatly improved, crude and accessory manufacturers improved their material, the car proved highly efficient and the star we had "hitched to" seemed nearer and brighter. It was in this year that I designed the safety device which has saved lives—also the curved dash with small tool lockers and the chain pull that equalizes the strain on the main bearings. We also used chain oilers on the crank and transmission shafts.

In 1905 we built a four cylinder car which, with nominal advertising, no traveling agents, and no performance of road or racing stunts, requiring special cars and highly paid factory experts, we again caught the public favor and quickly sold four hundred big touring cars—no more and no less. We were compelled to refuse many additional orders, some with bonuses above the price of from $250 to $750.

It was in this year I patented the now famous dust proof body and introduced lockers and rails for wraps and many other features of comfort and efficiency.

The result in every way exceeded my most sanguine expectations and the star shone still brighter and was much nearer.

Our success was so great I have about completed a new model fire-proof factory, constructed entirely of concrete, steel reinforced. The mechanical equipment has been greatly increased. The capacity is One Thousand Fifty Horsepower Automobiles per annum.

I have the same superb mechanical force who are inspired by the same ambition and who are co-operating with me loyally and energetically to realize our high ideals and which we believe will be fully realized in the 1906 Thomas Flyer, which has been greatly improved in every detail of workmanship, material and design—notably:

Forged I beam axles—great, strong steering knuckles—steering apparatus all forged—no brazed joints. Cross steering rod behind front axle. Large separate motors. Mechanically operated valves opposite sides. Improved radiator, fan and pumps. A disc clutch that will not slip under any condition when engaged. Four forward speeds—with one Hyatt roller and five Hess Bright bearings. Altogether fifteen Hess Bright ball bearings, one Hyatt roller and two ordinary ball bearings—twenty-one anti-friction bearings in all. A beautiful new dash and body seating five or seven as desired. Four great big wide brakes—the foot alone will stop a loaded car on a twenty-five per cent down grade.

I am very proud of the New 1906 Thomas Flyer—and I believe the American public will be proud of it. The best foreign cars may have some few unimportant details that we haven't got—and we have some important ones they do not possess. But we have put the design, material, workmanship and money into this car to make it at least equal to the highest priced car in the world, and I believe that the verdict of a just people will, based upon intrinsic merit solely, place the 1906 Thomas among the world's greatest and best, and as such I present it.

E. R. THOMAS,

For The E. R. Thomas Motor Company.

1906 ATWOOD LAMPS & GENERATORS

No Guesswork about ATWOOD LAMPS

WORKS OF ART

They are the result of 30 years of experience as builders of Good Lamps.

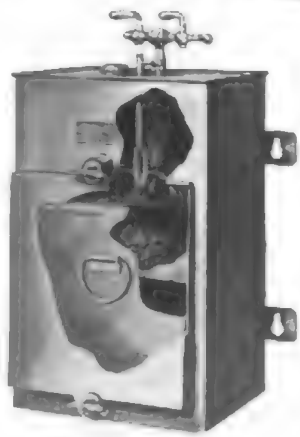
They cost a trifle more than the others, but they are worth the difference.

There is a REPUTATION behind them that stamps them "HIGHEST GRADE."

No Equal at Any Price

In an Acetylene Gas Lamp the Generator is the power behind the throne. If you have a good Generator you are certain of having a good light.

Atwood Generators surpass anything ever heretofore placed upon the market.



PATENT APPLIED FOR.

SIMPLE— EFFECTUAL

Motor Age Circulation

How Many of Our Esteemed Contemporaries Can Show a Letter as Strong as This?

MILWAUKEE, WIS., Aug. 10, 1905.

Mr. N. H. Van Sicklen, care Motor Age, Chicago, Ill.

Dear Sir:—We shall consider it a great personal favor if you will send us the films taken by your representative of our car, and shall be pleased to pay you for them.

Evidently the Motor Age is extensively read, judging by the number of letters pouring in upon us from people who have seen your write-up.

Trusting you will be able to favor us, we beg to remain, very truly yours,

FOUR-WHEEL DRIVE WAGON CO.,
By H. Theo. Hansen, Vice President and General Manager.

The above cut represents postoffice receipts for 6,666 pounds net, of issue of October 5, 1905.

Each paper, including wrapper, weighed an average of 9½ ounces.		
6,666 pounds divided by 9½ ounces equals	11,227	papers
We also sold, **non-returnable**, to Western News Co. and news stands direct	672	"
Mailed under stamps to foreign addresses	89	"

ELECTRICITY
Is Great Stuff To Steal Away

When it does this in your Spark Plug through the Soot Accumulation, your troubles begin.

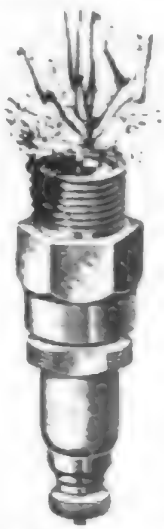
In the Soot-Proof PLUG

THIS WAS NEVER KNOWN TO HAVE OCCURRED

WHY?

1-32 OF AN INCH.

This is the amount of air space the current must overcome in order to spark.



WHY?

ONE FULL INCH

of soot deposit. This is what the current must overcome to short circuit.

But One Full Inch of Soot Deposit Offers More Resistance to the Current Than

1-32 inch of air. Hence the "SOOT-PROOF PLUG" Does Not and Cannot Short Circuit.

1/32 INCH

INTRODUCING THE NEW Yale

Four Cylinder

Five Passenger

35 Horse Power

2,400 Pounds.

Price complete $2,800 F. O. B. Toledo

When you are introduced to the "New Yale" you will take off your hat. We know you will, for our 1906 automobile is an aristocrat in appearance and a Hercules in power. However, if you will not take off your hat on first sight, we'll take you for a ride, and we know you'll take it off then. If you don't, we'll simply open the throttle and blow it off.

We expect to sell our entire output to men who are "from Missouri."

We ourselves have been delighted in the speed and action of our 1906 car and we are no easy ones to please. The "New Yale" had to show us just as it will have to show you and we are ready to talk business.

We have some desirable unoccupied territory and would be pleased to make appointments with established agents to call at our factory, where they will be initiated into the "show me" method. Particulars by letter.

BRIEF SPECIFICATIONS

Wheel base, 104.
Engine, 4 cylinder, water cooled.
Wheel steer, new control.
Speed on direct drive, 4 to 55 miles per hour.
Wheel, 34x4
Transmission slide gear. Three speeds forward and reverse.
Pressed steel frame.
Pressed steel sub-frame.
Springs, 2x46 front, 2x54 rear.
Chainless drive.

Write for photographic reproduction of the car.

A Live Line For Live Dealers : : : : : WRITE

JACKSON AUTOMOBILE CO.
JACKSON, MICH.

"No Sand Too Deep. No Hill Too Steep."

DEALERS

During 1905 we built and sold more than 4,000 Cadillac cars.

Not one purchaser of these cars is willing now to let his "bargain" go at less than the price he paid for it.

For 1906 that name

CADILLAC

will possess more than ever before a magic meaning to live dealers.

There are hundreds of towns in the U. S. where Cadillac cars have never been sold. We want an agent in each of these localities and if **you** are a **good business man,** you will at once get in touch with us. No line was ever so attractive as ours will be for 1906.

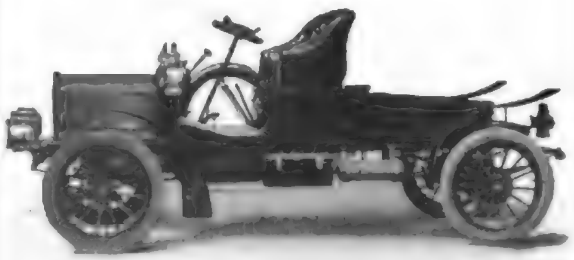
THE INCOMPARABLE

WHITE

THE CAR FOR SERVICE



THE WHITE RUNABOUT

If seating capacity for two is sufficient for your needs, you would do well to inspect critically the White Runabout. It, of course, possesses all those qualities of simplicity, durability and reliability which have made the White the favorite touring car of this country. In addition, is the increased speed which results from the lessened weight. The price, furthermore, is less than that of our touring car. The White Runabout should certainly appeal strongly to those who wish a stylish, speedy and silent car.

OLDS MOTOR WORKS

Member Association Licensed Automobile Manufacturers

Lansing, Mich., U.S.A.

A few interesting facts regarding the new MODEL D

STODDARD-DAYTON

"A Marvel of Simplicity and Mechanical Construction"

Motor—4 cylinders separately cast. Mechanically operated valves. Motor accurately balanced and develops up to 36 horsepower under brake test.

Transmission—Sliding gear type, 3 speeds and reverse. Timken roller bearings, dust and oil-proof aluminum case. Gears case-hardened steel forgings, properly cut and chamfered.

Ignition—Jump spark. Two storage batteries. Coil on dash. Concealed wiring. Special terminals.

Control—In this feature WE LEAD.

Gasoline and spark levers are located directly under the wheel and are operated with the left fingers without taking the hand from the wheel.

Change gear lever works in H slot and is positive, permitting of change speeds without intermediate steps.

Foot brake and clutch treadles.

Emergency brake lever next to change speed lever.

BRAKES—Three powerful ones of large diameter—one on transmission; two on rear wheels—all encased.

Frame—Pressed steel. High carbon hot rolled stock. Deflection impossible.

FRONT AXLE—Special I beam section one piece, with yokes. Drop forged spindles and arms.

REAR AXLE—Clutch drive type. Extended hubs on differential casing running in roller bearings. Driving axle carries no weight. Timken roller bearings in wheels.

Propeller shaft encased in steel tube, which acts as torsion lever. Gears and bearings adjustable.

Springs—Special stock—40-inch front, 50-inch rear, 2-inch wide—all semi-elliptic.

Wheels—Artillery pattern; 32x4 Timken roller bearings throughout.

Tires—Any standard American make.

Body—Large, roomy tonneau, well made throughout. Capacity five passengers. Same lines as 1905 model.

Finish—Stoddard-Dayton Pearl Gray standard. Other colors to specifications.

Trimming and painting in our own shops.

Wheel base 103 inches. Gasoline 15 gallons.

Metal grease pan under motor.

Weight 2,100 pounds.

Price $2,250 F. O. B. Dayton, O.

A careful examination of the new Model D will show clearly the proper distribution of metal—which enables us to produce a 2,100-pound machine embodying an exceedingly high factor of safety and with the powerful motor gives 1 horsepower to approximately each 59 pounds dead weight. We have therefore succeeded in keeping the weight down and power up—a feature of the greatest value.

Advance Booklet now ready. Complete and detailed Catalogue later. Few good Agents wanted in unoccupied territory.

SEARCHLIGHT SWINDLERS

The success of the Rushmore Lens Mirror Searchlight has been so complete that as a matter of course the lantern makers have been compelled to either try to imitate it or go out of business.

A number of them have conspired to keep us out of the automobile shows, have claimed that we do not make the celebrated Rushmore Lens Mirror and that they get their cheap flat lenses from the same place, and have resorted to every contemptible trick to deceive people into buying their trash.

Certain so-called jobbers have tried to push the sale of the imitation lights by issuing lists of what are insinuated to be our prices in comparison with their alleged cheap prices. The statement that we ask the prices quoted is a deliberate and malicious lie. The prices they offer are but a few cents lower than ours, while the fake lights they offer are by comparison not worth their weight as junk.

Some of the fake jobbers refuse to furnish the Rushmore light when requested to do so on the plea that we cannot make delivery. That statement is likewise a deliberate lie. They offer to refund your money if not as represented, but you had better hold on to your cash.

We do not ask any money in advance, but will send the Searchlight on ten days' free trial to anyone worthy of credit. The fake jobber can make but 25 per cent to 30 per cent on the Rushmore, while he clears 100 per cent to 200 per cent on the fake lights which he obtains on consignment. Do you wonder that he is willing to cheat you?

Our prices are the lowest for the quality and we ship from stock.

The Hartford Perfected Dunlop Tire

Paris, July 28, '05.

Dear Sirs:-

We have arrived in Paris coming over the Route Nationale from Aix les Bains via Lyons and Nevers. The roads were exceedingly trying, very hard and a lot of "pave" or cobblestones. I had two punctures. These were the only mishaps in 2136 miles and the tires have stood the hard work without showing any other signs of wear and tear. People here consider this a very good record as many of the best foreign tires blow out from the heat.

Yours truly,

Walter Hale

Postal

Watch for others to follow.

The Hartford Rubber Works Company, Hartford, Conn.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

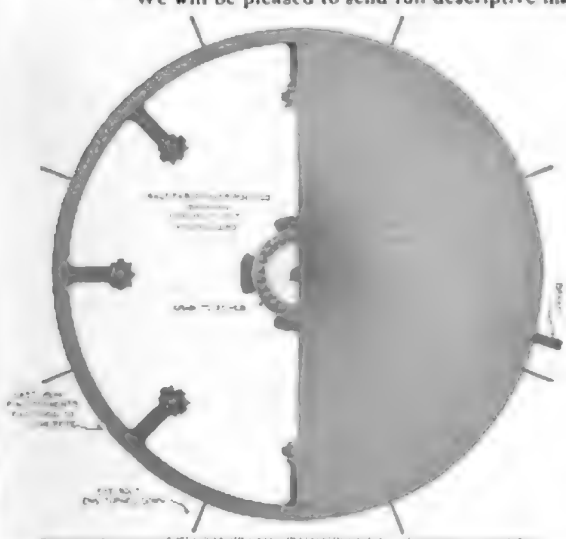
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.



Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

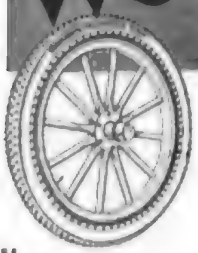
WOODWORTH DETACHABLE TREAD



For Automobile Tires

Is the proper equipment for fall and winter use. prevents slipping and skidding on muddy or icy streets. It also protects the tires from hard, frozen roads. The treads can be put on without removing the tires from the wheels. They are held rigidly on the tires by side-wires which pass through the loops and are tightened by small nuts. No special tools or equipment are required to apply them—with a wrench and a pair of pliers anyone of ordinary ability can do the work.

Can be used on any pneumatic tire, no matter how badly worn, if it is strong enough to stand the air pressure.

You will need something for use for this fall and winter. Why not get the best thing there is?

They are not exorbitant in price.

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen: We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,

THE OSCAR LEAR AUTOMOBILE CO.

THE AUTO-METER

on a car tells the speed of travel and the distance traveled. It is absolutely accurate.

"Built Like a Chronometer."

When you are whirling along, a glance at the Auto-Meter before you, tells you **exactly** how fast you are going if your pace be as slow as a fraction of a mile or as fast as 60 miles an hour.
When a trip is finished, the Auto-Meter tells **exactly** how many miles you have gone on that trip.
When the season is over the Auto-Meter tells **exactly** how many miles you have covered during the season.
All this is worth while. Is it not?
Get acquainted with the Auto-Meter. It will lead to lasting friendship.
Write for catalogue and pamphlet, "Indisputable Evidence." The latter gives the interesting experiences of many prominent automobile owners.

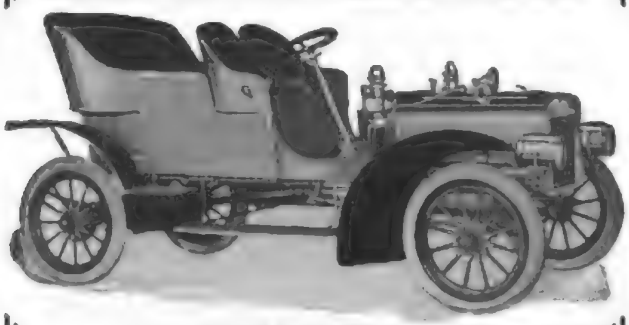
MOLINE



18-20 HORSE POWER

Model "B"—$1,600

Four cylinder vertical motor that develops more than the rated H. P. Pulls through heavy roads and up hills in a way that surprises the owners of higher-priced cars.

Has all the good features of most $2,000 machines and costs $1,600.

For the first time this season we can make immediate deliveries

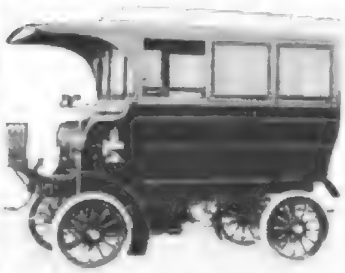
We have only a few of them left and they will go quickly. Perhaps our proposition might interest you.

Model "D"—Our stock of these substantial 12 H. P. Touring Runabouts is decidedly limited. The prices we are making is closing them out fast. If you want one, speak quick.

Moline Automobile Company

EAST MOLINE, ILLINOIS

The Waterless Knox



Always ready for use and can be used all day long any day in the year.

The Knox Patent Corrugated Pin System of air cooling is the **best cooling device extant** and the only one that **makes satisfactory all-the-year-round service** possible.

Knox 2-cylinder cars give **more speed** than most 4-cylinder cars of anywhere nearly equal horse power, but cost far less for up-keep and running expenses.

THE KNOX LINE offers the greatest variety of commercial car types, each one a proved success, the result of years of experience in making and selling automobiles for real service.

Why Premier Cars

Appeal to All Classes

To the Professional Man—because of its simplicity.

To the Business Man—because of its readiness to go at all times.

To the Repair Man—because of its perfect accessibility to working parts.

To All Men—because of its low cost of fuel and maintenance.

We have much data from drivers on this latter point; for instance, one writes us: "The total cost of my running this season—5,000 recorded miles—is only a trifle over one cent per mile for the car, or 1-5 to ¼ cents per mile per passenger; total for repairs, fuel, etc., excepting tires."

These are points to remember when purchasing a car.

The Air Cooled Season never ends.

Side Entrance $1,500. Runabout $1,250

Our new [1906] Doctor's Special $1,425

Light Truck $1,400

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the **two** cycle two cylinder Elmore engine. Understand—the **two** cycle two cylinder Elmore engine produces **two impulses every time the flywheel turns.** As you know, the two cylinder **four** cycle furnishes only **one** impulse every **fourth** time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

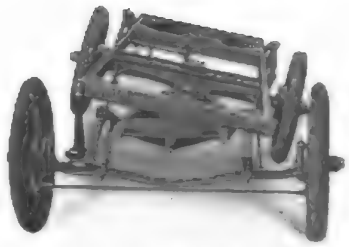
Full Extension Top, $150.00 extra. 108 inch wheel base, 36 inch wheels, 4 1-2 inch tires, 44 1-2 inch rear seat. Bevel gear drive, direct on high speed. Our new sliding gear transmission has four forward speeds. Write for complete description.

AUSTIN AUTOMOBILE CO.
GRAND RAPIDS, :: MICHIGAN

Rear Wheel Raised Over a Foot



Lower Frame Level

Master of All Roads

No car fits this description unless it makes good its claims on rough roads. The only car that takes you over the roughest roads at good speed with a very luxury of motion and without incurring undue friction and binding strains in the mechanism is

THE MARMON

"A Mechanical Masterpiece"

It is the only car that is not built on the unyielding principles of a log wagon, and the picture illustrates the flexibility that places it in a class by itself, due primarily to the exclusive, patented feature

Double Three-Point Suspension

Cast aluminum body on one frame, power plant on another frame, each frame suspended on three pivotal points. No matter which wheels are raised, no matter which frame is tilted, the entire mechanism is maintained in perfect alignment, free from the twisting and binding strains inevitable in all other cars. Means greater efficiency and less wear on all parts, tires included. Four cylinders, air-cooled.

A carefully constructed, luxurious car for those buyers who exact the best of the high grade. :: :: :: :: WRITE FOR BOOKLET NO. 1.

Third in Elimination Race September Twenty-third

If You Build A Racin' Car

to run 60, 70 or even 80 miles an hour, you won't need any extraordinary mechanical ability. You won't produce much that is of value if you succeed.

BUT

if you become the owner of a Royal Tourist, you have a car that can go fast enough to qualify in the Vanderbilt Cup Trials, and make the round of the course any number of times without the troubles the racing cars had, and one that will stay on the road, carry its passengers with comfort and safety, do its work quietly, and without strain on the motor or running gear.

REMEMBER

The Royal proved itself faster than the racers, and any owner will tell you about its reliability and comfort.

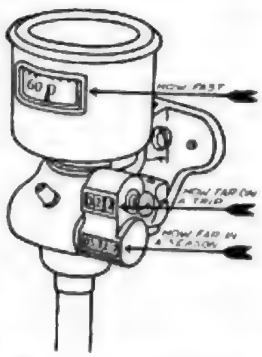
THE AUTO-METER "BUILT LIKE A CHRONOMETER"

TELLS THE SPEED OF TRAVEL TELLS THE DISTANCE TRAVELED

Tells both with absolute accuracy



The **Speed Dial**, six inches wide and easily read, records the speed of a car from a fraction of a mile to sixty miles an hour and does it unerringly.
The **Trip Dial** records the distance traveled on a trip or for a day.
The **Season Dial** records the total distance covered in a season.
There is satisfaction in knowing how fast your car is traveling, satisfaction in knowing how far it has traveled. You enjoy this double satisfaction with an Auto-Meter on your car. Some one of your friends surely has one. Ask him about it.

In the meanwhile let us send you a catalogue and interesting pamphlet, "Indisputable Evidence."

THE HAM GOLD BLAST AUTO LAMPS

"THE LAMPS THAT LIGHT THE ROAD"

MR. MANUFACTURER:

Don't close your lamp contract for 1906 until you look over our line. We have no competition in light giving and burning qualities, and our lamps will surely interest you.

MR. DEALER:

Isn't it worth something to sell your customers lamps that will not only satisfy them, but will bring them back to tell you what a fine light they give, how steadily they burn in the strongest winds and over the roughest roads, and what a good fellow you are for selling them good lamps. They'll tell their friends about it, too.

MR. AUTOMOBILIST:

Are you discouraged with the oil lamp proposition? If you are, we know you haven't tried the

HAM COLD BLAST AUTO LAMPS

because they are a delight to the most critical. They are strongly built, handsome in appearance, give a powerful light, and are always reliable, as they are wind proof and will not jar out. Never smoke, consequently the interior is always bright and clear, and there is no odor.

BRISCOE MFG CO.

OLDEST AND LARGEST MAKERS OF

AUTOMOBILE RADIATORS

DURING the past season we sold 12,945 radiators to 54 bona fide motor car manufacturers among whom are nearly all of those who have produced high-grade and successful cars.

Over 30,000 of our radiators are now cooling automobile engines.

Our standard honey comb radiators are of true cellular construction, allowing cross circulation and accounting for their high-cooling efficiency per pound of weight of cooler.

The hit of the year 1905 in radiator design has been our flat tube construction with gang fins. We make special designs for every class of car from the light runabout to the heaviest truck or omnibus.

The finish on Briscoe fenders is unexcelled. 1906 styles on metal dashes, hoods and runabout boxes are prepared and we are daily booking contracts for next season's business.

COOLERS FENDERS

HOODS TANKS

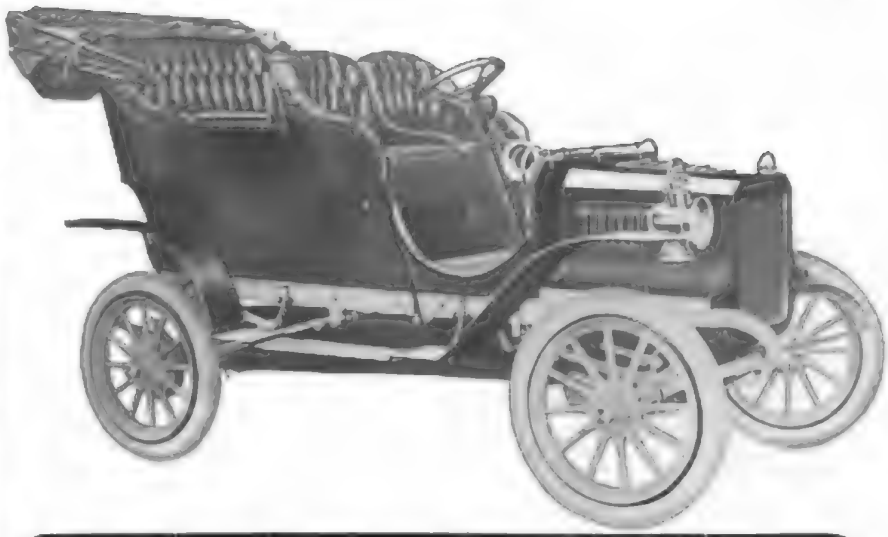
By dealing with us you get the benefit of our long experience and the protection of the many patents we own, covering our methods of construction.

The Pierce Great Arrow car which won the Glidden trophy was equipped with a Briscoe radiator. Of the twelve American water-cooled gasoline cars which received first certificates at the end of the tour six of the radiators were made in our shops, four were made by the car builders, and only two were made by other radiator manufacturers. These facts are typical of our prestige.

Our two large plants are ready to take care of our rapidly increasing business. We cannot only promise but make deliveries.

Write to our nearest office for estimates and get in line for 1906.

BRISCOE MFG CO.
DETROIT, MICH. and NEWARK, N. J.



REO for 1906

Built for What Happens

What REO Cars did in the past year demonstrated them built not for imaginary occasions, but for actual motoring—and always ready for the unexpected.

It was *actual* weather and *real* mud that made many of the 30 starters in the Chicago-St. Paul tour quit half way and finish by rail But the REO was one of the only four to come in on schedule time and on their own wheels.

Pecowaic and Paddock Hills—up which REO stock cars held a 26-mile clip on a 12 per cent grade, and captured 4 cups from cars of double their power-rating and price—are not theoretical difficulties, but *genuine* hills, that call for *genuine* power.

Old Mt. Washington is no stage scenery; but a *veritable* mountain. Up its 8 miles of ragged, dangerous, 10 to 15 per cent grade (with patches of 25 per cent), a REO car, in the great "Climb to the Clouds" cut down its class record 23 minutes, and beat its nearest competitor a minute to the mile.

Those were *practical* rocks and deep, *substantial* sand in the 1,050 miles of the famous Glidden Tour, over which two REO cars, without stoppage or repairs, carried 4 passengers each at a total cost of $3.10 per passenger.

The 1906 REOS do it all a shade better because of the same splendid construction; and a few slight improvements which put them right up to "concert pitch."

Write for the REO book that tells why.

REO 1906 Touring Car 16 h. p., 1550 pounds, 90-inch wheel base, 5 passengers, side door detachable tonneau. Speed 15 miles per hour. **$1250**

REO 1906 Runabout —convertible into a 4-passenger car. 8 h. p., 900 pounds, 2 passengers, 25 miles per hour **$650**

Or with folding seat to carry two extra passengers facing forward **$675**

Colorado

At Her Best

In late summer Colorado is at her best. The green of the verdure on mountain and meadow is slowly turning to crimson and gold. Afar looms a peak whose snow-capped summit is enshrouded in autumnal haze. The air is laden with the spice of mountain pines and fir trees.

Colorado is surely the best place to go for the autumn vacation.

Very low rates via the Rock Island—Standard and Tourist sleepers and electric-lighted chair cars.

The "Breech-Block" Plug

The Plug With a Handle

To take out your watch or open a *Breech-Block* requires just the *same time, same tools, same effort*, and one *facial* cleans the *entire* porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it drops out of its holder, and the gaskets of copper *asbo* with it. No digging!

It is nickeled inside and out. *Highly polished* and *dust-proof*. Sparks between two *adjustable* points and not between one point and the *shell*. Its points are protected.

Porcelains are *hand turned* and so perfectly glazed that soot cannot stick to them. Their corners are cut to perfection, and every particle of the idea of cheapness is left out of them. Can you think of a way to improve them regardless of cost?

The Persuasive Instrument

¶ The average person who drives a motor car has a desire to speed—to "let 'er out."

¶ But we have yet to find the man who has an insane desire to get within the clutches of the law.

¶ *The Jones Speedometer* has that peculiar influence over the speeding motorist—if he is beyond the limit—there is that "arrow"—a constant reminder. It persuades him to go slower. Thus it accomplishes a great service.

¶ And to each user of The Jones Speedometer we present our brass Protection Tag which warns the officer of the law, not to arrest on guess work.

The HAND ON THE WHEEL

applies the brake by a touch of the finger, quick or slow, instantaneously when necessary.

A cord on the Steering Wheel operates the

WATRES SPENT GAS BRAKE

A touch on the cord applies the brake. The engine, through this device, does all the work of running the car, applies the brake, blows a powerful whistle (the only way to clear the road), and inflates the tires.

GAS ENGINE WHISTLE COMPANY

1135 Broadway, New York

Chicago Representative, WILLIAM R. JOHNSTON, [illegible] Ave

Booklet No. 1 Brake, No. 2 Motor Boat Whistle, No. 3 Stationary Engine Whistle.

There was a time when a regular and reliable ignition was a problem. This problem is solved today by the **HERZ TIMER**. We have made and sold over 70,000 of these instruments last year, to the most prominent manufacturers in this country, as well as in Europe, and are making now four distinctly new models for four of the leading manufacturers in America. The reason for this success: It's Tool Steel vs. Tool Steel, best Sheffield grade obtainable. **Sticking Vibrators** absolutely impossible; running packed with grease; built like a watch, tool maker's work throughout. We make 18 models and fit **any** make of motor. State make of your motor when ordering.

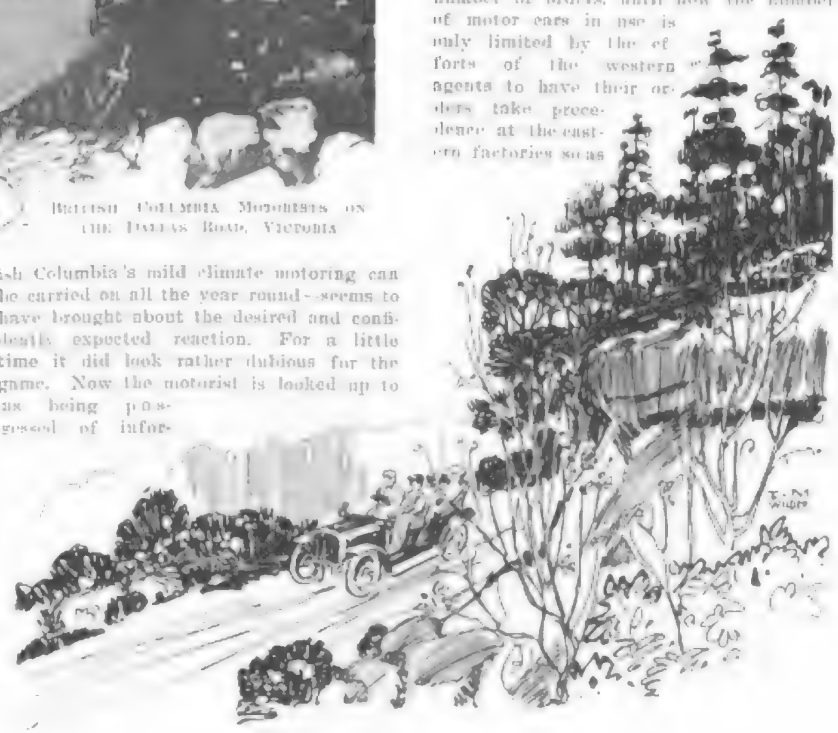
MOTOR AGE

VOL. VIII NO. 17 CHICAGO, OCTOBER 26, 1905 $2.00 Per Year

MOTORING IN BRITISH COLUMBIA

BRITISH COLUMBIA MOTORISTS ON THE DALLAS ROAD, VICTORIA

VANCOUVER, B. C., Oct. 21.—When it comes to writing the history of British Columbia 1906 can be set down as automobile year. Not because it marked the introduction of the modern motor car in this far western province, for automobiles have been a more or less familiar sight for the last 2 years in Vancouver and Victoria, as well as the other coast cities in the province. But hitherto the motor cars have been rather few in numbers and looked on by the majority as being a new means of recreation but a rather expensive toy. The steady and consistent performance of the pioneer machines in all weathers and seasons—for in British Columbia's mild climate motoring can be carried on all the year round—seems to have brought about the desired and confidently expected reaction. For a little time it did look rather dubious for the game. Now the motorist is looked up to as being possessed of information and an accomplishment out of the ordinary—in fact, the motorist occupies much the same position here now as the cyclist did in the years 1894-5-6, when the bicycling craze struck the western provinces with the added force of its complete adoption by the effete east. Early this season it became evident that the tide was about to turn as far as motoring and the automobile industry was concerned. British Columbia has some sterling sportsmen within her borders and the reports of the enthusiasm with which motoring was being adopted in the east—accounts of which occupied no inconsiderable space in the daily press—led to a host of inquiries about the automobile and its possibilities in British Columbia, which met with a ready response from eastern manufacturers when they saw the field before them. These in turn were followed by a large number of orders, until now the number of motor cars in use is only limited by the efforts of the western agents to have their orders take precedence at the eastern factories so as



In Beacon Hill Park, Victoria, B. C.

to be able to give early delivery. At first there was the usual almost exclusive demand for a light runabout machine to carry two passengers. Then as that class of machine demonstrated that the cost of operation was a very small item, the desire naturally followed for the larger touring cars. But while the use of motor cars as an up-to-date means of recreation has been enthusiastically adopted by the ultra-fashionable society, and promises in the near future to be equally popular among the middle classes, the commercial side of the motor industry has more than kept pace with the luxurious touring car.

Possibly the strongest object lesson of the serviceability and versatility of the automobile was furnished during the seasons of 1903-4 in both Vancouver and Victoria by two runabouts of the standard Oldsmobile pattern. Two leading dry goods firms—one in each city—each imported a machine of that class early in 1903. Of course, to western eyes, they were quite a curiosity at the time, being the first of their kind in the province. It was natural that their performance should be watched with interest. Fitted with delivery box attachments in the rear, these cars did yeoman service day after day in delivering dry goods. The greater part of the time each machine accomplished the work of delivering small parcels that had previously kept one and often two delivery wagons busy.

It is to the bicycle—advance agent for the modern motor car—that much of the knowledge of these roads is due. For until the advent of the bicycle, touring, with the exception of a few horseback parties, was practically an unknown quantity. Then when the bicycle was so universally adopted it was discovered that instead of being limited as to territory there was practically an unlimited number of tours available that made the two-wheeled machine more useful than a horse. At the present time, as the result of new roads being opened up and prosperous new mining and agricultural districts being developed, British Columbia has a touring area available for motorists that will compare favorably with any American state on the Pacific coast. There has been a large number of visiting touring motorists in British Columbia this summer. Many motor enthusiasts from Southern California, came north to Portland. From there some came over to attend the Lewis and Clark exposition at Vancouver and spent some time seeing the sights of the growing terminal city. A few venturesome motorists who are interested in mining properties in the Cariboo country and other localities in the interior of British Columbia shipped their cars up to Ashcroft and then made the 300-mile trip along the historic Cariboo road as far north as Barkerville. Ashcroft is located on the main line of that great national highway—the Canadian Pacific Railway. Barkerville is the chief mining center for the interior and is up near the source of the Fraser river—the father of waters in British Columbia—whose yellow flood annually brings down thousands of dollars in gold dust and nuggets, enriching bars and benches all along its banks from which rich returns are secured by western miners by washing and dredging year after year.

Another strong attraction for touring motorists from southern coast points was the Dominion exhibition—Canada's great national fair—which this year was held in New Westminster, a thriving city of 10,000 inhabitants situated 12 miles from Vancouver. The Dominion exhibition opened the last wek in September and continued for 10 days. Tourists came up by way of Seattle, Bellingham and Blaine, and crossed the Fraser river at New Westminster by means of the new million-dollar railway and traffic bridge recently opened. There are many points of interest in the vicinity of the royal city, which is one of the oldest on the mainland of British Columbia. New Westminster, it will be remembered, was almost wiped out by fire about 5 years ago, the entire business and part of the residential section having been completely destroyed. Many fire-scarred relics of that terrible conflagration yet remain as silent testimonials of the awful baptism of fire which the royal city received on that occasion.

Vancouver and New Westminster are also connected by two splendid roads. One of these runs direct between the two cities and the other goes round by way of Hastings, a small village on Burrard Inlet. The former road has always been a favorite resort for cyclists and is now equally popular among the constantly extending ranks of the automobiles. Much of the way the road is wide enough for four automobiles to drive abreast, while the hard and well kept macadam surface allows little dust. Just a few days ago the distance between Vancouver and New Westminster was covered by a Ford four-cylinder car and a 20-horsepower Oldsmobile touring car in 23 minutes. This constitutes a record over this road. The feat was accomplished by S. J. Lynch, of Seattle, who drove the Oldsmobile, and R. F. White, of Bellingham, who presided at the wheel of the Ford. As there are steep hills on the outskirts of both Vancouver and New Westminster the time i-

Popular Motor Parade Ground in Beacon Hill Park, Victoria, B. C.

Digitized by Google

considered noteworthy. The inter-urban electric tramway runs between the two cities in a more direct line than the road, yet the best time made on the tramway by a special car was 27 minutes; so the feat demonstrates the superiority of the automobile over that distance anyway. Lynch and White, who spent a week in Vancouver with a party of friends, also achieved the distinction of making a new record over the international course between Bellingham, Wash., and Vancouver, B. C. The distance is 65 miles and was covered in 4 hours and 17 minutes, which included a stop for breakfast and some minor repairs and adjustments. The time is considered by western motorists who have gone over the course as particularly good in view of the fact that just after crossing the boundary line into Canada, near the town of Blaine, there is a mountain nearly 1,000 feet high to be surmounted. The road, however, winds up it by easy stages and any car with good power has little difficulty in surmounting it. With the exception of this one hill the road between Vancouver and Bellingham is a splendid one for motoring and this course promises to be a popular one with owners of touring cars as it passes through New Westminster, Blaine, Ferndale and several other small villages en route. The customs regulations are liberal and so far both the American and Canadian officers have shown themselves very courteous and obliging to touring motorists, which adds to the popularity of the route.

PRETTY WOODLANDS FORM CHARMING BACKGROUNDS FOR THE PHOTOGRAPHER

The two leading cities in British Columbia are Victoria, the capital city, situated on the southern end of Vancouver Island, and Vancouver, the terminus of the Canadian Pacific Railway, situated on Burrard Inlet, an arm of the sea running into the mainland. Although Vancouver is without a doubt the more progressive city of the two and now has almost double the population of Victoria, still the capital city has more than double the number of automobiles within her borders than all the rest of the province combined. This may seem strange to an outsider, but it is mainly due to the fact that Victoria has a large proportion of well-to-do English residents among her population. There are also many retired army and naval officials as well as successful miners and pioneer residents who have made their pile in gold mines or real estate speculation in early days.

Esquimalt, situated 3 miles from Victoria, and until recently the naval base of the British North Pacific squadron, has always been the temporary residence of a number of English naval officers who were accustomed to the use of the motor cars in dear hold Hengland, and it was but natural that they should import cars or runabouts for their use while stationed at Esquimalt for several years. The constant presence of a large garrison—the Fifth Regiment Canadian Artillery—to man the extensive fortifications at Esquimalt, naturally led some of the officers to wish for a quick means of transport besides the tram cars, between the forts and Victoria. Until this spring there were few well-to-do people in Victoria who did not own their carriage and pair or at least a single horse and phaeton. But now that is all being changed and the motor car is responsible for the change. The horse is being shoved into the background as a fashionable means of recreation and travel and the automobile is IT with both letters in capitals. The number of new cars that have been purchased this season in this far western city would compare very favorably with the most enthusiastic motoring city of the same size in the east. From two large touring cars and a half dozen runabouts with which the ultra-fashionable set astonished its friends last season, Victoria's motor brigade has grown to half a hundred. And there would be more but for the fact the local agents cannot guarantee delivery soon enough. The increase in the number of motor cars this season in Victoria has been one of the sensations of the year and the daily newspapers of the capital city as well as other coast cities have commented favorably on the fact as an evidence of the progress of the west.

Not alone is Victoria at the head of the list of western cities as far as the number of automobiles is concerned, but the capital city also has the distinction of having the first automobile club organized in western Canada. When the automobile fever struck Victoria early in the spring steps were at once taken by a number of enthusiasts to organize a club. The objects of the club were announced as the promotion of good fellowship among the motorists, the inauguration of a campaign for better roads and the safeguarding of the legal interests of automobile owners and drivers. The club is known as the Victoria Automobile Club. It was decided to commence a campaign for the improvement of certain portions of many of the principal thoroughfares in the vicinity of Victoria. A number of the roads leading to Shawnigan, Goldstream and Nanaimo and other popular objective points for motor touring, needed ballasting badly in certain places. While the surface of the majority of the road was all that could be desired, there were a number of spots where loose sand gravel prevailed. Owing to a peculiarity of the topography of the interior of Vancouver Island a number of sandy hills prevail. These sandy hills proved serious drawbacks to motoring, for while the grade of the hills was not very steep, the loose sand rendered some of the hills almost impassable for all but the more powerful cars.

Although the recreation and touring possibilities of the automobile are of the most roseate hue in Victoria, the trade situation in the capital city is also equally promising. The brisk demand for motor cars has naturally led to many agencies being established. As yet few of the local agents have had a chance to carry any cars in stock for more than a few days at the most. Inadequate storage facilities at present also hamper a number of the leading dealers, but arrangements for several large salesrooms and garages are being made.

The present season started out in a promising manner in Vancouver as far as the automobile was concerned, but just at

Digitized by Google

After experimenting for years with various forms of observation and vestibule cars calculated to give passengers a better opportunity to enjoy the scenic beauties of the Cascade, Selkirk and Rocky Mountain ranges, the Canadian Pacific Railway has reverted to the use of automobiles to solve the problem. An automobile passenger service was operated during the summer months by the C. P. R. between Glacier and Field. These two stations, which are situated on the main line of the C. P. R., are 75 miles apart. Between them lie some of the grandest and most impressive mountain scenery to be found anywhere in the American continent. The views are so beautiful and varied that much of the beauty is lost owing to the speed at which the Imperial Limited and other fast passenger trains travel in their 4-day journey from tidewater to tidewater. F. C. Collins, the traveling passenger agent of the C. P. R., made the announcement regarding the new automobile passenger service. He said:

"The very latest thing in railroading has just been inaugurated by our company. We have no fewer than twenty-five automobiles to operate between Glacier and Field, which takes in all the famous mountain resorts along the line of the Canadian Pacific Railway. Each motor car is capable of carrying sixteen passengers, including the driver. The wheel base is considerably longer than that of an ordinary automobile and the tonneau is double the size of the ordinary touring car and is somewhat differently arranged as regards the seating capacity. The wheels, of course, are of steel and flanged. The driver has nothing to do but control the motor as there will be no steering necessary. The front of the machines is protected by a large glass shield. This will protect the passengers from some of the strong gusts that occasionally sweep through the valleys of the mountain ranges. But there is no other canopy or enclosure to the cars so that the passengers are thus able to get the full benefit of all the scenic grandeur. Many rich tourists visit the various mountain resorts on the Canadian Pacific Railway each year. For several years past the number of requests to be allowed to ride over this portion of the mountain section on the top of a freight train or the pilot of a locomotive has amounted to a constantly increasing number, so to accommodate that class of tourist the company decided to establish the automobile passenger service. I might also add that Sir William Van Horne, the president of the C. P. R., was the first to suggest the inauguration of this style of travel. Sir William got the idea from Charles J. Glidden, the world-touring motorist, who made part of his journey across the American continent in his Napier car over the tracks of the Canadian Pacific Railway. Mr. Glidden had a set of special steel wheels made for his car, and prior to starting out on his railway journey demonstrated to a committee of railway men at Minneapolis that he could cover 1 mile a minute in his car. In coming across the Canadian Pacific Railway Mr. Glidden carried a conductor and ran on a regular train schedule. Sir William was very much interested in the experiment and by his orders Mr. Glidden was several times sent out just ahead of the Imperial Limited and other fast passenger trains whose schedule called for an average of 33 miles an hour, including all stops. Mr. Glidden did not know that his Napier car was being submitted to such a test at the time, but he had no difficulty in maintaining his schedule. Afterwards Sir William met Mr. Glidden at Vancouver and told him of it. The C. P. R. president also inquired into many details and the cost of that method of travel. Sir William was taken for a short trip up the line from Vancouver by Mr. Glidden in his world-girdling car before it was placed in bond. Mr. Glidden assured Sir William that had it been necessary he would have had no difficulty in maintaining an average speed of 40 miles an hour during his trip over the rails—and that on about half the consumption of gasoline usually required on the average highway. So the establishment of the automobile passenger service this summer is the direct result of Mr. Glidden's inaugural railway automobile trip."

No one doubts but what the automobile is a success in British Columbia, touring as well as commercial. The pioneer commercial machines have certainly been a success and it is but the matter of a short time until the motor car will be a powerful competitor with the horse—even in a country where equines range the hills in thousands and a horse can be bought far more cheaply than a saddle and bridle.

J. BULL'S DULL SPELL

England Experiencing Lull Before Show Time—Nothing Doing But Unimportant Stunts

London, Oct. 14—We are experiencing the lull that invariably precedes our show storm. With factory managers deep in travail over their show productions, depot managers quite unable to give any official information regarding next season's models, and nothing moving in the sporting line, the side shows of automobiiists are having an inning. These side shows at the moment are the various associations that have sprung into existence around the motor car and its users, and such odd advertisement-providing devices as drives to Constantinople; drives of 2,400 miles without stopping the engine, and 24 hours' trips from Brighton to Edinburgh without changing from the top gear.

The Constantinople tourist is R. L. Jefferson, who was once well known by his travels with a bicycle over the same route, to Moscow and to Khiva. He is an official of the Rover Cycle Co., of Coventry, which has begun to make motor cars. It is stated to be a private tour by Mr. Jefferson, but some people have an indefinite suspicion that he will return in time to have his Rover car exhibited in all the honorable array of mud at the Olympia show.

The 2,400 miles drive was a disastrous attempt on the part of the manager of Mors, Ltd., the English branch of the big French firm, to deprive the Clement-Talbot car of the Dewar cup which was given a year or so ago by the whisky knight—Sir Thomas Dewar—for a phenomenal long stop-over drive by D. M. Weigel, late manager of the earl of Shrewsbury's motor car company. It was the second attempt of the Mors people and ended when about half of the proposed 2,400 miles had been covered by the driver falling asleep and driving into a ditch, smashing up the car, himself and his passengers, though not seriously. The top-gear performer was Cecil Edge and the performance was intended to illustrate the peerless flexibility of the six-cylinder Napier engine. The car was started from Brighton on its top speed gear, rated to do about 45 miles per hour at maximum, and the gear lever was not touched until Edinburgh—about 460 miles—had been reached in about 23¼ hours' driving, spread over 2 days. As there are plenty of steep gradients on the route, ranging from 1 in 11 to 1 in 17, the flexibility of the engine was amply demonstrated, but since the horse power of the engine is probably nearer 50 than 30 and the total load well under two tons, the flexibility is not quite so convincing as 15-horsepower drivers would like. The fastest speed registered was 46.5 miles per hour and the slowest—just to illustrate the range—1.33 miles per hour.

The efforts of the minor associations to justify their existence has led to the adoption of special lines of effort. One takes the general advancement of the British motor car industry under its care, another seeks to protect motor car drivers from police traps, and so on. The former is being sadly knocked about for having, it is alleged, accepted the responsibility of publishing the somewhat muddled statistics of George Prade's to the great glorification of the British motor car maker and his market. The figure, or rather Prade's conjectures reduced to figures, are shown to be all wrong, but nobody seems to be worried, not even the man who translated the article and sent it to the English press. The association that is endeavoring to defeat the police seems a jolly body. It took a lot of pressmen out last Sunday and they were lunched and refreshed ad lib. during the course of a long drive into the heart of Surrey, taken in order to show how the police trap is circumvented by means of a system of cyclist patrols in the neighborhood of police-trapped areas. But it is perhaps a coincidence that during the next few days the police bags were heavier than ever. It would require an army corps of cyclists and an expenditure of £100 a day to patrol the roads for 50 miles around London. Consequently the police are likely to have the best of the game. The deep and increasing discontent which the expensive measures of the police have created has found voice in a decided proposal to create roads for motorists alone. And the project has so far progressed that a distinguished engineer like Sir Douglas Fox has actually taken the pains to map out a scheme of this nature and has had the Daily Mail give it editorial blessing.

ECONOMY TEST OFFICIALS

New York, Oct. 24—At its meeting last night the contest committee in charge of the proposed 6 days' economy test of the New York Motor Club, which will start next Monday, chose the following officials: Ezra T. Fitch, referee; H. H. Everett, superintendent of observers; M. C. Reeves, superintendent of garages; W. B. Coleman, quartermaster in charge of fuel supplies; and Ernest Ferguson, chief inspector. A. L. McMurtry, C. H. Hyde, E. F. Fitch, F. J. Griffin and F. Ed Spooner will furnish and pilot the official cars, which are to accompany the run. It will be determined later whether it will be practicable to lay out different routes going and coming. The entries close on Friday. Those so far received are: Two Reos, two Compounds, a Frayer-Miller, a Marmon and four Franklins. It is reported, however, that the Franklin entries have been withdrawn. It is stated that the entry of four Maxwells has been promised.

GLIDDEN SAILS FOR EUROPE

New York, Oct. 24—Charles J. Glidden sailed today on the Kron Prinz Wilhelm for Marseilles, whence he will take ship to India to resume his around-the-world tour. He has yet some 8,000 miles to cover in India, Ceylon, Siam, China and Japan. By way of farewell Mr. Glidden interested a large gathering at the A. C. A. last night with an illustrated lecture of his experiences in Australia, New Zealand, Java and the islands of the southern Pacific and Indian oceans.

LANCIA AS A JOLLIER

Italian Driver Promises to Tell His King of Warm Reception Given Him in America

New York, Oct. 21—Both as a grubfest and gabfest the banquet promoted by Senator Morgan at the Press Club last Wednesday night in honor of the foreign racing men was a howling success, though Hemery, the Hamlet of the play, and his racing partner, Wagner, were conspicuous by their absence, having been attacked at the last moment with stage fright at the idea of meeting a brigade of American after-dinner speakers. Lancia was there and was promptly installed by the speakers as the lion of the feast, an honor perhaps not altogether undeserved under any circumstances. Nazarri, of the Italian team, and Sisz, of the French quintet, completed the roll of foreigners in attendance.

A congenial bunch was in attendance, not hampered by the awe of society surroundings or an overflow of millionaires. Is there any wonder that everything went off with a hurrah?

The foreigners entered heartily into the goodfellowship and informality of the occasion. Lancia shook his fat sides with merriment. Dignified Nazarri relaxed into a continuous wreath of smiles and Sisz was convulsed with laughter at the spicy Parisian bon mots of Batch, the boulevardier. All the speakers gave the Europeans a high old send-off and the best line of jolly in their repertoire. The Frenchman and Italians were certainly made to realize that they were the candy.

Sam Miles, who was toastmaster, kept the pace stiff and gave the cue to the speakers that enabled them to interest themselves in oratory.

Lancia was greeted with uproarious applause when he rose to make his little speech, which was translated by Mr. Unlander.

"I can rightly call you my American friends," said he, "and also the thousands who lined the course in the race. No driver could expect the warm reception that was extended to me, and I can assure you that when I return to Italy it will be my great pleasure to tell the Italian people and our beloved king of the warm reception awarded to the sons of Italy in the United States. The Italian king, as you know, is an enthusiastic automobilist, and, believe me, he is a driver of great ability. It is regrettable that an accident happened to my car, as the time made shows that if nothing had happened a world's record would have been made. I do not believe for a moment but that the accident was one which might happen in any race, and I absolve Mr. Christie from any intention of doing me or my machine any wrong."

To each guest was given a gold watch fob with the impress of the Vanderbilt cup on one side and the seal of the New York Press Club on the other. The menu cards showed the cup filled with champagne bottles, with legs climbing a ladder to its brim. The various courses were named after the drivers in the race.

Digitized by Google

Lancia and Nazarri are to sail tomorrow. They are to leave their Vanderbilt cars behind them. They say that they hope to come back for the Florida meet; but, to be candid, the chance is small as they will be busy trying out the Fiat cars. It is probable, though, that Chevrolet and Cedrino will be pilots of the Fiats at Ormond. It is not unlikely that some rich Americans with racing aspirations may buy the cars used by Lancia and Nazarri for use in the southern circuit. It is even rumored that W. K. Vanderbilt, Jr., has bought them for $28,000.

On La Savoie, which sailed last Thursday, were Hemety, Wagner, Sisz and Duray, of the French team; Jenatzy, of the German team, and M. Faroux, special commissioner of L'Auto; and Baron Ardien de Turckheim, of the Automobile Club of France. They were given a warm send-off.

SMALL ROAD RACE IN CUBA

Havana, Oct. 23—Enthused by the Vanderbilt cup race, an attempt was made yesterday to run a 100-mile race over Cuban roads. Only three cars faced the starter, though, and none of these finished. So unsatisfactory was the contest that another will be held next Sunday. The weather conditions were perfect. Nevertheless, only three machines lined up at Arroyoarena—E. R. Brown's Queen, Ralph Doniphan's Darracq, driven by Charles Harrah, and Frank R. Ruze's De Dion-Bouton, driven by Joseph T. Miller. Frank Bowman had entered his Darracq, but the machine was wrecked by a trolley car, which struck it violently from behind, while it was going very slowly on account of a puncture. The first trouble encountered by the racers was in the town of Guanajay, where policemen with drawn revolvers waved red flags as a signal to stop. One driver, believing there was some danger ahead on the road, came to a full stop and was then informed that he must travel slowly through the town. The next driver wrenched the flag from the policeman's hand, not slackening his speed. The first accident was when Brown, who handled his own car, in making a turn on the road, threw out his mechanic, Joaquin Lopez, who sat by his side. Lopez was not much hurt, and yelled to him to proceed. Brown did so, but soon broke down. Harrah, who was driving Doniphan, crashed into the side of a culvert, exploding his tires and breaking several parts of the machine, besides hurling two men into a ditch. They, however, escaped without injury. Ruze, who started last, passed the others on the road near Artemisa, when his axle broke.

CHICAGO SHOW APPLICATIONS

New York, Oct. 24—There have already been 180 applications for the 131 spaces on the main floor of the Coliseum at the N. A. A. M. show. S. A. Miles, general manager, has an idea that a gallery can be added, which will give 10,000 square feet of additional space. He will leave for Chicago tomorrow to put it through if it be found practicable.

Over 45,000 square feet of space has already been applied for for the exhibition of the Automobile Club of America, to be held in the new Sixty-ninth Regiment armory next January.

QUIZ ON RACING GAME

N. A. A. M. Seeks to Enforce Sanction Rule on Road Contests — Asks Opinions

New York, Oct. 24—Samuel A. Miles, general manager of the National Association of Automobile Manufacturers, is sounding the members of the association for their views on racing, with the idea of bringing these views before the executive committee next Tuesday. That the committee favors drawing the line and debarring the N. A. A. people from competing in unsanctioned events is shown by the following resolution which it has adopted:

"Resolved, That this association is opposed to the holding of contests which have not been approved by its executive committee and that it shall not be permissible for any member to take part in any such unapproved contest under penalty of being debarred from participation in such events as may be held with the approval of or under the auspices of this association."

In his letter the general manager says:

"The replies on the resolution by members indicate that the measure is heartily approved. We are now desirous of obtaining your opinion concerning the advisability of a similar but more stringent resolution, to go into effect in 1906, and should be glad of replies to these questions:

"Are you in favor of the adoption of a resolution requiring members to refrain from participating in road contests, such as competitive tours, endurance tests, economy tests, etc., which have not been approved by this association?

"Do you favor a penalty for the infraction of such a rule, if passed; for example, refusal to permit transgressors to take part in such events as are approved by the association?

"If such a resolution is passed may we rely upon you to abide by its provisions?"

Interviewed by a MOTOR AGE man today as to the attitude of the National Association of Automobile Manufacturers toward the entry of cars in tests of various kinds promoted by clubs and others, Manager Miles said:

"The resolution adopted by the contest committee at its last meeting tells its own story. It was not aimed at the New York Motor Club or any other club in particular, but was a mere expression of the committee's views on the general subject of participation in independently promoted tests. The N. A. A. M. contest committee, which took the action in question, is made up of Messrs. Waldon, Davis, Clifton, Kittridge and Pope.

"It is likely, however, that the members of the association will express themselves much more forcibly on this subject next year and take radical action to limit the participation of members in these contests.

"'We get applications every day,' said a member to me, 'from people asking us to go into these contests, whose promoters look to the trade to bear the expenses thereof. It has now come to a point where we must take some action to protect ourselves, for you can readily understand how difficult it is to discriminate even if we desired to enter tests other than those directly sanctioned by our association.'

"Any statement that I influenced the committee in any way in its action is nonsense. The resolution was adopted by the committee at its own initiative and solely for the protection of the trade."

Of the entrants to the New York Motor Club's economy test the Reo, Compound, Frayer-Miller, Maxwell and Marmon cars are non-members of the N. A. A. M. Mr. Miller says that Mr. Franklin writes him that the entry of the Franklins has been withdrawn.

HERALD NOW FAVORS RACING

New York, Oct. 24—Following the success of the Vanderbilt race, the New York Herald has made what looks like a right-about change in its attitude toward international road racing. Previous to the race, evidently under orders from Paris or a desire to please the owner of the paper, the race was persistently referred to as "the last international race." Mr. Bennett had evidently swallowed bob, hook and sinker the Marquis de Dion's advocacy of the abandoment of racing for touring contests, and was reported to have consented to let the Bennett cup be put up by the French club as the prize in such a test. He was quick, though, to read the handwriting on the wall in the success of the Vanderbilt race, the American demand for its continuance, and the evident inclination of the foreign competitors to take part in future races in this country. For 4 days the Herald has been filled with interviews, largely pro and very little con, on the advisability of future contests. It introduces a whole string of interviews with prominent tradesmen, clubmen and importers, in favor of racing by a very large majority. Then the Herald makes a clean switch and says the Vanderbilt cup is likely to be returned to its donor by the Automobile Club of France for competition in the United States next year.

It is to laugh at all this argument. Everyone knows that there will be an international road race in the United States next year and probably for several years to come, and more than likely the Bennett race will be run again in Europe, and in all probability in France itself. France cannot afford to stay out of these contests.

THOMAS CUP CONDITIONS

New York, Oct. 23—Only two conditions are made by E. R. Thomas, of Buffalo, who has offered a cup to be put up in competition for American cars, in the selection of an American team for the Vanderbilt cup race next year. The first is that it shall not bear his name and the second that the committee which has actual charge of the race for the cup shall not have as a member anyone who is interested either directly or indirectly in the automobile business. To formulate the rules to govern the contest, Mr. Thomas asks that every recognized American manufacturer be represented at a meeting to be held within a short time and at which the details can be discussed.

GET NEAR TO NATURE AND REALLY LIVE

BEFORE another decade passes it will have been proved that the motor car is the salvation of the rural districts—not because it will have been responsible for the bettering of the highways throughout the country, but because it will have been the means of taking rural life away from the isolation that now surrounds it.

For the past couple of decades there has been an alarming tendency on the part of the country youth and the country maiden to drift toward more settled portions of the country and to surround themselves with such luxuries as city life naturally brings. No man or woman can be blamed for disliking isolation. It has been the cause of more insanity than any other one thing.

Heretofore farm life has been a drudge to both sexes. The advent, however, of rural free delivery and trolley cars has done much to relieve rural residents of a considerable portion of their monotonous existence. But the trolley car with its expensive equipment and its necessarily expensive right of way cannot reach all sections of the world; it must be assisted in its endeavor to prevent an exodus from the country.

Therefore, it devolves upon the motor car to finish the work the trolley started. When the day has come when motor cars, for pleasure and for business, shall pass over all the highways and byways of the country, the tendency to flock to cities will have passed away, to a large extent, and the man who today is living in crowded tenements will see his way clear to live as nature provided he should live, to see comforts and blessings which now are largely found in cities alone.

The automobile cannot perform its share of this great duty until the people of the country and the people of the cities, together with their representatives in various town, city, county and state governing bodies shall have started in the furtherance of this great plan by providing highways upon which it is possible for road locomotives to travel. It has been shown time and time again that every section of the country which is provided with good highways is in a prosperous condition; it has also been shown that where poor roads exist poor farms and poor people also exist.

There is little use today in attempting to educate the masses in the matter of the benefits which good roads will produce. The work must go through the legislatures. When the state and the nation shall have been convinced that good roads will be the life and the salvation of the rural districts and the enemy of race suicide good roads will come and until good roads come the other matters referred to will be where they are today. Good roads, coupled with the use of motor vehicles throughout the country, will not only make marketing and purchasing more accessible to the country resident but will also bring the country schools nearer the people, giving the younger minds that fertilization they do not receive now.

It will remain for motor cars to be the blood and good roads the arteries supplying life to the towns and country. It may take a long time, first to accustom the farmer to the automobile and then to convince him he needs the combination of automobile and good roads, not only for the pleasure of himself and his family, but as a means of fattening his pocketbook and saving him an immense amount of labor as well.

There is an immense amount of work for automobilists to perform regardless of the selfish side of the matter. It is their duty as citizens to promulgate such doctrines as have been herein laid out. They are in better positions to do this missionary work than others. The automobilist is now seeking the country on tours and must necessarily meet hundreds of ruralites in the course of a season. The farmer and the merchant in the farming district towns will be found susceptible to argument, particularly when shown that his pocketbook will be benefited to say nothing of himself and his family.

This great work should be the work of those associations and clubs which have been organized by automobilists and which must, in order to survive, have some other object in view than the mere promoting of races and club runs. There is a citizenship duty which must be considered; without considering this duty the entire organization must fail. The formation of automobile clubs was somewhat like the formation of bicycle clubs in the early days, but the bicycle clubs eventually drifted along and into larger organizations, which commanded the respect of the entire world in their endeavors to secure benefits not only to wheelmen but to the community at large.

So far the attempts of the automobile organizations to secure such benefits have been minute, notwithstanding the fact that ample groundwork has been laid and ample opportunity offered to produce results which would be of everlasting benefit, not only to the automobilist but to the entire community. When the minute automobile organizations and automobilists arrive at the point of doing what they do do for their own selfish selves, just then will their mission fail. No selfish person ever accomplished anything in the long run; he has been a flat failure in the end. Such will be the end of automobile organizations if selfishness is a part of their makeup.

It might be added that the manufacturers of automobiles are pursuing a penny-wise, pound-foolish policy when they do not give some heed to the handwriting on the wall and endeavor to lay a groundwork for future business, which to them is life. The automobilist, the manufacturer and the driver must not wait for the farmer or for the politician or for anybody else; they must go out for the game themselves, win their own spurs and merit the victory.

AN UNSETTLED MECHANICAL QUESTION

IT IS clearly evident from the results of many of the big road events of the season of 1905 that the question of superiority of either double side chain or shaft drive for final transmission on racing cars is as far from settlement as it has been since either came into prominence, and it is further evident that the question will remain open for some time.

The first two cars to finish in the Long Island contest were fitted with shafts for final drive and the next two with double side chains. On the other hand but five of the nineteen cars entered were so fitted, the others, save one, being equipped with double side chains. That the cars fitted with either form had not the least trouble from this source would tend to further prolong the argument as to the superiority of one over the other.

Heretofore it has been generally claimed that the double chain drive was superior to the shaft for racing cars of high power, but the work of the Darracq, the Renault, the Panhard and the White this season and the Packard Grey Wolf and others last season has proved that, for final drive, the shaft system at least holds its own so far as standing up is concerned and also so far as speed is concerned when the matter of power is taken into consideration.

There is an increasing tendency among makers on this side of the water to use shaft drive, not that it is cheaper to construct, but that, owing to the poor and dirty roads and uncertain weather conditions, it can be kept free from mud and grit. Doubtless, too, this form permits the making of a more quiet running car, although the little hum from the gears is present, which is offset by the slight dry rattling of the chains.

The makers of the chain-driven cars naturally claim smaller loss of power in transmission to the road wheels, and on the other hand the makers marketing shaft-driven machines are quite as well satisfied that no perceptible loss, if any, can be determined.

It will take another year and then still another to determine to the satisfaction of makers and designers which form of final transmission is better. In the meantime it will be up to the salesman's talk to convince the new customer and the old one will have been convinced by his own experience. The contest will be finally settled by long tours and road events.

Jump Sparks

Banqueting the foreigner drivers by Senator Morgan might have been by way of a little salve for some of them.

What becomes of all the automobiles is as much a problem now as was that of what became of all the old bicycles in years gone by.

Abroad there are several big events to take place before the year ends, but at home the only battle will be between the rival makers and rival agents.

If the National Association of Automobile Manufacturers taboos all sorts of automobile contests except those sanctioned by itself, the American Automobile Association and the Vanderbilt cup commission may as well go out of business.

It must have been disagreeable to have that man Moore—against whom an injunction was secured in re the Selden patents—die and then bob into life again. The question is, on whom is the joke, if it was a joke?

At least one American automobile maker and one American tire maker had occasion to do and would have been justified in doing a little crowing over their respective successes in the Vanderbilt cup race, but modestly refrained from doing so, which illustrates that Americans are not as boastful as some people had imagined.

T W

Foreign drivers who competed in Vanderbilt cup race sail for home; Senator Morgan gives banquet at which Lancia and Nazarri are lions.

C. J. Glidden sails for Europe to resume tour of world; sub committee of Glidden tour of 1906 confers with donor of cup regarding ing event.

National Association of Automobile Manufacturers sends out quiz to find how its members stand on sanctioning road contests.

Webb Jay leaves Buffalo and returns to his Cleveland home; he says he may take a whirl at straight away racing.

Automobile Club of Germany reported to be working on international road race for 1906; discord among officials.

More motorphobia boba up in Chicago; mayor and chief of police deny authorship of automobile rules.

Beach meet at Atlantic City, N. J., is postponed to Easter week, when 4 days' racing will be given.

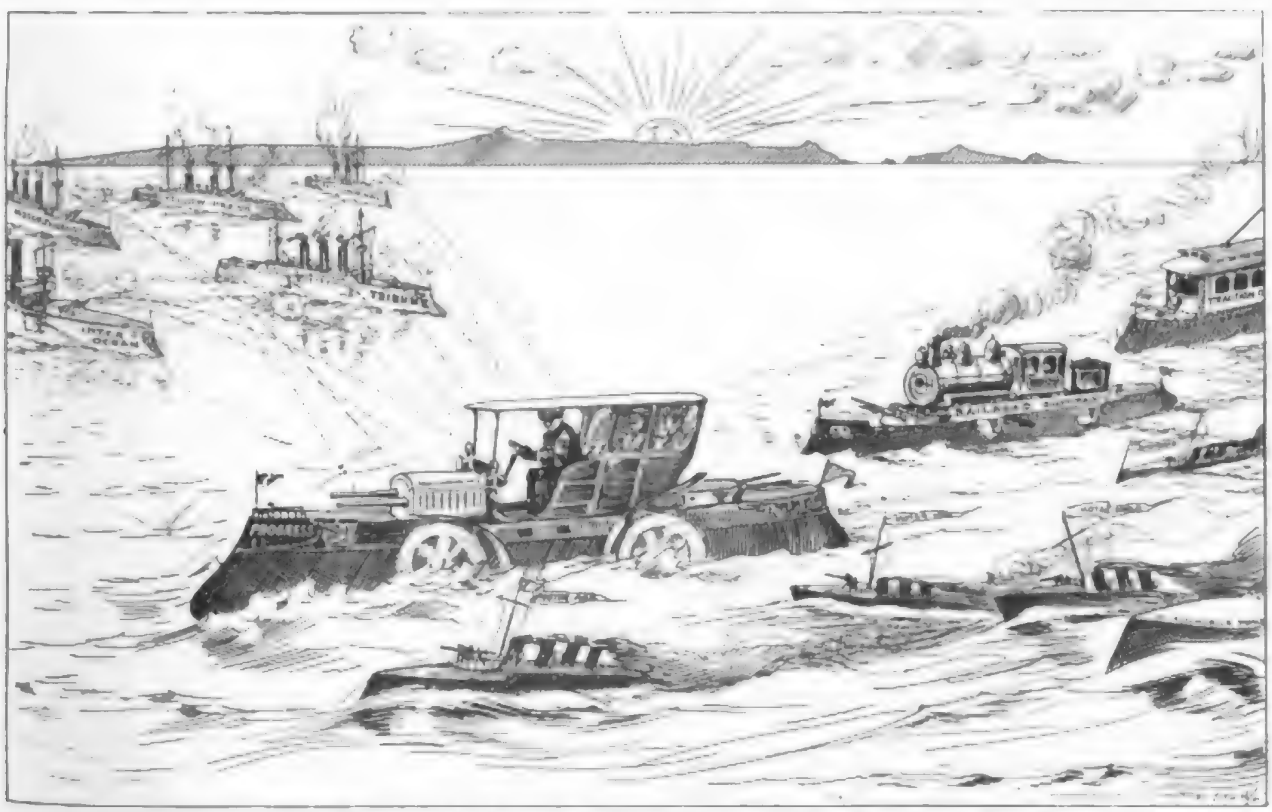
Percy Megargel, on his way to Pacific coast, fears he may be snowbound in some mountain pass.

The attacks of the motorphobia press are akin to a western wind—sort of squally, a little uncomfortable sometimes, but not at all dangerous if one is a good sailor.

Apparently Webb Jay is afflicted with a fever—the speed fever. Is it possible he contracted that malady in the hospital at Buffalo or was it just from reading the accounts of the Long Island road race?

Now that the Illinois supreme court has decided that a driver of a horse-drawn vehicle has the right to stop an automobile by raising his hand, it is suggested that the aforesaid drivers of horse-drawn vehicles would better change hands at least once in a while for fear of contracting the one-hand-raising habit and keeping the said one hand aloft and from under the bed clothes on cold winter nights.

The Fleet of Transportation is today headed by the Automobile as representing the most powerful and most modern fighting ship. The Fleet is attacked by an Opposing Fleet, which is directing all its heavy gun fire directly upon the flagship, appreciating the fact that the other ships are in no manner a menace. With all this heavy fire directed against it, the good ship Progress sails on, its armor too sound to feel the fire from the antiquated guns of its enemy, nor does its commander even deem it necessary to open fire on the enemy, knowing his own safety.



CAPTAIN "A Few Fireworks by Starboard." ADMIRAL "Admiral" "Sail On. They're Only Squibs."

JAY IS STILL RACE-MAD

Injured Driver, Out of Hospital, Says He May Take Up Straightaway Work—Goes Home

Buffalo, N. Y., Oct. 21—Webb Jay has so far recovered from his recent accident at Kenilworth park track that he left this city for Cleveland on Wednesday. He admitted before he went that he had changed his mind about the 1905 Vanderbilt cup race being the last event of the sort to be run in this country. Jay's previous view had been that the 1905 race would be so marred by accidents that it would put a stop to long distance road races in the United States. Jay thought the racers did remarkably good work this year. He referred to the fact that he himself had spent a week earlier in the year on the course and that he had said at that time that the course was about a mile-a-minute drive. The winner in the race did better than that, however, and Jay thought it a very creditable performance. Jay intimated that while he has abandoned the track he may take a flyer at some straightaway racing. He did not say exactly when it would be.

His condition was promising. During the week he spent at a hotel after coming from the hospital his leg, which was fractured on August 18, bothered him a bit, but that probably was because he had used it too much. Jay said after seeing so many disabled folk at the hospital he had come to think that there were few well persons in the world and it was almost with surprise that he saw people walking on the streets and riding in street cars and automobiles.

"It's strange," he said, "what queer ideas one will get after spending 8 weeks in a hospital."

Cleveland, O., Oct. 24—Webb Jay, the automobile driver who crashed into the fence at Buffalo Aug. 17 and whose escape from death will long be looked upon as one of the miracles of modern surgery, arrived in Cleveland from Buffalo by boat a few days ago. Jay is still very weak from the effects of his accident and he was unable to talk about the mishap. His wife, who has been his constant attendant during the dreary hours at the Buffalo hospital, said her husband talked sometimes of his accident, but his recollections were very indistinct. After the first shock of the machine crashing into the fence he knew nothing for many days. As much as possible they try to keep his mind from dwelling on the theme, for even though the physicians feel sure of his ultimate recovery, they dare not risk exciting him. Jay has every chance in favor of recovery but he will probably never be the man he was before the accident.

MOTORPHOBIA IN CHICAGO

Chicago, Ill., Oct. 23—Mayor Dunne says he didn't; Chief of Police Collins says he didn't, and so the automobile public is wondering who is responsible for the set of alleged rules governing motorists in Chicago which appeared in all the morning papers last Thursday. The city's chief executive, who had been credited with issuing the rules, denied having given them out and said it was probable the chief had. The latter cleared his skirts by claiming that the official rules were nothing more than memoranda gathered for use by the police and were not intended for the public. He blamed "some irresponsible person" for the paper getting out of his office. These rules, as published by the dailies, were eight in number and were supposed to be for the purpose of governing automobile traffic in the city streets. They were as follows:

Chauffeurs should give pedestrians every advantage.

Chauffeurs must not only not run down persons, but they should be careful not to frighten them.

Chauffeurs should avoid great speed. I would be liberal on this point in the day time and in places where the road is clear. I would be strict after dusk and wherever there are many people.

Chauffeurs should be compelled to go slowly always while in the business center and particularly at crossings.

Chauffeurs should only use the right half of the roadway, no matter how long they may be delayed before the opportunity comes to pass preceding vehicles.

Chauffeurs should not overtake and pass moving street cars. This rule I would be the most strict about, as an automobile becomes most dangerous appearing unexpectedly when retreat is cut off by the moving car.

Carry rear lights placed so as to shine on the licensed number.

Light front and rear lights at dusk, no waiting for darkness.

A. L. A. M. ON MOORE CASE

New York, Oct. 24—C. F. Cunz, head of the patent department of the A. L. A. M., interviewed by a MOTOR AGE man today, had the following to say of the service of Moore with an injunction and summons for an accounting for his infringement of the Selden patent through his use of an unlicensed imported car:

"When we sent out the announcement that an injunction had been issued forbidding the use of an unlicensed car by W. J. Moore, there followed a story that Moore was dead and some of the papers raised a laugh at our expense on the assumption that we had obtained an injunction against a dead man. This made us resolve to follow up this man Moore, who had gone to Texas. We recently learned that he had returned, was at Albany and had several trips to New York. Last Thursday night a deputy marshal served him with the injunction and summons at the Ten Eyck at Albany."

BEACH RACING IS OVER

Atlantic City, N. J., Oct. 23—At a meeting of the race committee of the Atlantic City Automobile Club, held this evening, it was decided to postpone the meet proposed for November 14 and 15 and enlarge it to a monster 4 days' racing carnival in April, beginning on Easter Monday. It was found to be doubtful whether the entry of a sufficient number of fast cars to make a November meet a success could be obtained. Besides, in Easter week touring conditions are fine, Atlantic City is at its best and the new cars are out and ready for speed trials. With these conditions prevailing, a spring meet ought to be more successful.

SNOW ON ALL SIDES

Megargel Finds it Hard Work Making His Way to the Coast—Touch of Winter

Hailey, Idaho, Oct. 19—The Reo Mountaineer leaves for Boise this afternoon, loaded for a winter's trip over the mountains. It has snowed nearly every day for the past week and the mountain trails are now covered to a depth of several inches, making the going very difficult. From all reports we will encounter snow clad roads for the next 400 miles or until we are on the western slope of the Cascades, when we will have rain and mud instead of the snow.

At Boise we will replenish our wardrobe, substituting fur and heavy flannels for the lighter clothing with which we left New York city last August, for it is very cold in the mountains, especially early in the morning and evening. For the past week we have been breaking through the ice every morning in order to secure water with which to wash and fill our radiator. Thus far, with the exception of a few icicles found clinging to the pump one morning, we have not frozen our water supply, but we take care to drain the radiator and cylinder jackets every night before retiring.

Despite the extreme coldness of the nights, the days are very warm if the sun is out bright, although running through snowstorms up here in the mountains is anything but warm work. The snow blows against our faces and stings like needles, while our hands and feet soon become like lead. Both Fassett and myself remain healthy and not even a cold reminds us of the weather we have been through. Reports from the Cascade mountain towns tell us that there are 6 inches of snow already on the passes and that both sheepmen and mountaineers have moved down into the valleys, all predicting an unusually cold and snowy winter.

The Reo Mountaineer is still running on its original set of four Diamond tires, although I shall put on a new set at Boise. The ones now on the wheels are worn entirely through the rubber. Not a point of the several hundred little dots on our rear Bailey-tread tires remains, both rear tires being worn right down to the canvas. They can be recovered, as the canvas is still in good shape and the tires are perfectly air tight.

The scenery throughout Idaho is wild and grand. The inhabitants, especially in the hills, are miners working mines for silver, gold, tin and zinc. The majority of the mines hereabouts are paying handsomely. This country was mined, or rather the surface was worked over, some 15 years ago. Now the mines go deep down into the earth and new discoveries are made almost daily.

The hunting is about the best in the United States. At Cottonwood ranch, where we stopped when I drove Old Steady across the continent—the same ranch that sheltered Dr. Jackson when he drove across 2 years ago—I found the rancher busily engaged in setting traps for a number of bears that were prowling

Digitized by Google

around his big pastures, occasionally making way with a wandering cow or calf.

One of the bears is supposed, from the size of his footprints, to weigh in the neighborhood of 1,200 pounds, and the others are smaller—2-year-olds, as Rancher Drake expressed it. Drake and his son Chris are two of the best-known bear hunters in the west. The old man has a Colorado record of 144 bears in 3 months.

The danger of getting snowed in for the winter in some lonely mountain pass continues to increase as the season advances, for we cannot make one-half the time with the present amount of snow on the ground that our schedule calls for. One thing has demonstrated itself on this trip, and that is that it is impossible to work on a schedule. I thought, after having been over the ground once, that I could figure on a schedule that could be followed all the way across the continent, but rain, high water in the creeks, impassable fords, snow and unbroken trails have played havoc with all schedules I have yet undertaken to follow.

We have doubled our supply of blankets and increased our box of grub and cooking utensils, yet when we are compelled to sleep out over night we awake nearly frozen in the morning, while we seem never to have enough to eat in our camp box.—PERCY MEGARGEL.

DARRACQ INVADES ENGLAND

London, Oct. 14—The first of the French motor manufacturing concerns to actually invade British soil in the one way which can be permanent is Darracq's. This company, however, is mainly owned by a few English capitalists and therefore the decision to acquire a factory on the bank of the Thames, almost opposite the houses of Parliament, is not at all surprising. The major portion of the Darracq output has been bought in this country, for the cars are stylish looking and cheap for the power given. The repairs question, however, has given considerable trouble owing to everything having to be got over from Paris. The decision to commence manufacturing on this side of the English channel, therefore, solved a growing difficulty as well as decided a question which was bound to have arisen sooner or later. The factory is one which has been used for engineering works and is fairly well equipped. It has a ground area of about an acre and will be fitted out with the most modern plant for motor car manufacture.

TALK OVER GLIDDEN TOUR

New York, Oct. 20—Augustus Post, A. R. Pardington, M. M. Belding, Jr., W. C. Temple, E. T. Fetch and A. G. Batchelder, the sub-committee in charge of the Glidden tour of 1906, had a conference with the donor of the cup at the A. C. A. this afternoon. There will be an early announcement of the route and date.

A further sub-committee, made up of Post, Pardington, Belding and Batchelder, were appointed to draw up rules and recommend the route and date. It is practically assured that Canada will be included in the itinerary. Mr. Glidden thinks that two divisions—competitive and pleasure touring—would be impracticable. He thinks pacemakers would stop the fast driving encountered this year.

TALKS A GERMAN RACE

Dr. Stoepling, in Control in the Fatherland, Favors Contest in His Country Next Year

Berlin, Oct. 12—That Germany intends taking up the running where France leaves off through her refusal to defend the Bennett and Vanderbilt cups is evident in the light of recent developments. The resignation of Count Adalbert Sierstorpff as president of the technical committee of the Automobile Club of Germany shows there is discord in the ranks of the organization and that the racing element is in control. He quit his job because he was not in accord with his colleagues who want an international meeting this fall for the purpose of taking concerted action on the question of speed competitions. This leaves Dr. Levin Stoelping in active control of the Automobile Club of Germany and as he is a firm believer in racing, it is believed Germany will promote an international road race next year and that she will be given firm support by the other countries, including France, despite the latter's stand on the question of competitions of this sort. The doctor's views in the matter were clearly given the other day to a representative of the European edition of the New York Herald.

"I am strongly in favor of racing for automobiles," said he. "Every country is Belgium, Italy, America, England, yes, and France also. Here we are strongly in favor of it.

"What is this thing the French propose? It's a stillborn child. What gentleman automobilist is going to tour about for a fortnight along with a whole crowd of French chauffeurs? None, and, after all, what would it be?

"Just this: a couple of hundred automobiles may start; 185 of them will be French and fifteen so-called foreign machines. So a grand procession will start out for the pleasure of Count de Dion and his friends, and afterward there will be a grand flourish of trumpets over the triumph of the French automobile industry."

Dr. Levin Stoelping looked unutterable things, in which contempt predominated.

"Have you any news concerning the international meeting you proposed to call?"

"Not at present," he replied.

"Do you expect a favorable vote?"

"Yes; certainly."

"Then you consider that speed racing is still useful?"

"Certainly; I hold that speed trials have still a great deal to show, and speed trials are bound to be popular. France will come in. She will call it a pneumatic race, or any name you like, but a speed race is sure."

"And you propose having one?"

"Yes, if the French won't organize it we will. I, myself, believe that a speed race at Hamburg would be an enormous success and the French couldn't afford not to take part."

Through the same newspaper the Germans have heard the reply of the Marquis de Dion to Dr. Stoepling's remarks. The marquis says: "Why not let them race? I am sure I have no objection to their doing so if they gain anything by it. The French club has enough to do looking after the interests of the industry under its immediate care without preaching to other clubs. The fact that speed contests are to be held in Germany and America will in no sense affect our program in France. I don't say that some French firms will not take part in such contests. That would be their own affair. If you would like me to tell you what I think of the state of affairs in Germany I should say that instead of organizing speed contests the automobile clubs there would be doing vastly greater service to the industry in attempting to bring about an improvement in roads."

PIERCE GIVEN ROAD TEST

Buffalo, N. Y., Oct. 21—Since the Packard 24 made its fast run from Rochester to Erie a few days ago considerable rivalry has sprung up among Buffalo makers and dealers regarding the speed of cars, and the Pierce company sent out a car on Tuesday to show what could be done over a typically rough American road. Driven by Charles Sheppy, the car carried F. A. Nickerson, George Ulrich and H. Schneider, of the Pierce force, and J. R. Gameter, of the B. F. Goodrich Co., of Akron, O. On Tuesday afternoon Sheppy drove to Ashtabubla, where the party remained over night. Next day the car was driven to Akron through rain and deep mud. The Buffalo men spent Thursday inspecting the Goodrich plant and left for home at 9:50 o'clock Friday morning. Between Akron and Cleveland the road was not only hilly but very rough because of rain and snow of the night before. In Cleveland a 20-minute stop was made for gasoline and the noon stop was at Ashtabula, where 70 minutes were lost for luncheon. At Fredonia the car stopped an hour while the occupants took dinner. That was the last stop before the car reached Buffalo. Through the Indian reservation the road was very bad, but after that it was fair and the car reached this city at 9:30 o'clock, having covered the 236 miles in 9 hours and 30 minutes running time.

LEIPZIC HOLDS A SHOW

Berlin, Oct. 14—For the eighth time Leipzic has opened its annual automobile show with due ceremony and speeches by the city authorities and men prominent in automobile manufacture and sale. More than in former years types of machines for industrial purposes are making their appearance among the exhibits of touring and pleasure vehicles. As is usual in Germany and France the motor cycles and tricycles occupy a much more prominent place than in American exhibits of a similar nature, the tricycles for two passengers making an imposing array. The Mercedes people as usual have a prominent display, while the Torpedo, Hering and Richard and other large firms occupy ample space. Some prominent exhibitors are E. Nacke, Coswig; V. C. Schilling, Orlin & Schlundt, the Superior, Fahrrad, Robert Vieweg of Dresden, A. Horchand & Co. and Edmund Ulmann.

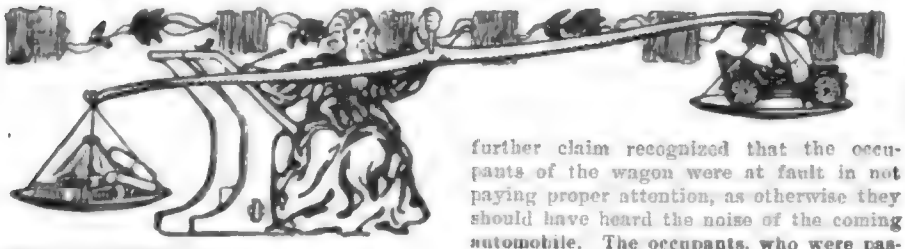
LEGAL LIGHTS AND SIDELIGHTS



SPEED LIMITS

Speed limits in force in ten of the leading eastern states are as follows:

Connecticut—Twelve miles per hour in cities; 15 miles in country.

Delaware—None stated, but slow down upon approaching a horse.

District of Columbia—Six miles per hour at cross streets, where there are car tracks; 12 miles per hour in city, where there are no car tracks; 15 miles per hour in country.

Maryland—Six miles an hour in built-up sections and at crossings and curves; 10 miles an hour elsewhere.

Massachusetts—Ten miles an hour in cities; 15 miles an hour in country; 8 miles an hour at curves and intersections.

Maine—Eight miles an hour in built-up sections, except where local laws permit greater speed.

New Jersey—Twenty miles an hour in country and where houses are 100 feet apart; reasonable speed elsewhere.

New York—Ten miles an hour in business and closely built-up sections; 15 miles an hour where houses are 100 feet apart; 20 miles an hour in country.

Ohio—Eight miles an hour in closely built-up sections; 15 miles an hour in other sections of the city; 20 miles an hour in country.

Pennsylvania—Ten miles an hour in cities; 20 miles an hour in country, and 10 miles an hour on curves, descents, intersections and where meeting horses.

Rhode Island—No speed laws. Must operate cars at a safe speed and stop motor if necessary to prevent accidents.

GERMAN IDEA OF LIABILITY

According to mail advices from Germany, the Hanseatic supreme court at Hamburg has handed down a noteworthy decision with reference to the liability of automobilists. Upon a country road in Germany an automobilist had overtaken a milk wagon without a previous signal. The horse attached to the milk wagon took fright and the driver and his wife were thrown out of the wagon and received injuries. The court fined the automobilist $35. The couple then brought a civil suit for damages against the motorist and the lower court held the suit to be justified. The appeal by the motorist was not entertained by the Hanseatic supreme court. The court stated it to be the simple duty of a careful motorist to give notice by a signal of the intention to overtake. To the claim of the defendant that the signal appliance had failed, the court remarked "that the automobilist should have waited until he could have given some other the wagon." Neither was the effective signal before passing further claim recognized that the occupants of the wagon were at fault in not paying proper attention, as otherwise they should have heard the noise of the coming automobile. The occupants, who were passengers upon the wagon, were not bound to pay attention, in the court's opinion. As the defendant by his carelessness had caused the accident, he was legally liable. The amount of damages will to fixed later on, it is announced.

WINK AT VIOLATION

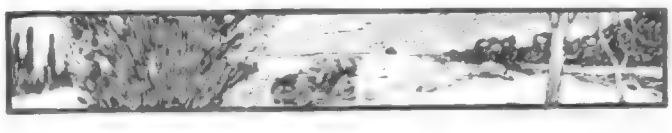
The members of the San Francisco park commission, after listening to the request of a delegation of automobile dealers, decided to let stand the ordinance which prohibits automobile driving along the south road after 11 o'clock at night. The police will be reinstructed, however, to make no arrests for such illegal driving unless a nuisance is committed. This action gives the privileges of the roadway to the motorists and leaves with the commission the power to enforce the ordinance if the protection of the public rights demand it.

HOLDS AGENT BLAMELESS

The case of Lettie Marshall against the Washington Electric Vehicle & Transportation Co., agent for the Columbia in Washington, D. C., in which Mrs. Marshall claimed damages in the sum of $10,000 for the death of her husband, Robert Marshall, who died as a result of injuries received by him in a collision with one of the automobiles of the defendant company a year ago, was tried last week, and resulted in a verdict for the company. It was contended by Mrs. Marshall's attorneys that the car was operated by an incompetent chauffeur and that the company was liable for that reason. The jury, however, took the opposite view, and decided in favor of the automobile company.

PUZZLED BY SCORCHING EVIL

The Automobile Club of Cleveland has pledged to prosecute reckless automobile drivers and has publicly announced that if any person has evidence of gross recklessness against any operator, and will present it to the club, the organization will prosecute the lawbreaker even though he be a high official in the club. There are wide differences of opinion among prominent automobilists as to the best course to be pursued in eliminating the evil. Secretary George Collister of the club advises abolishing the state speed limitations, which have proven faulty, and the enactment of a strong criminal negligence law which would punish reckless driving of any sort. State Senator Shallenberger, a prominent club member, takes the contrary view. He suggests leaving the state law providing for slower speed in business districts as it is at present, and allowing the cities and towns to define by ordinance as to what are built up portions. By setting down definite limits, offenders could not escape by the necessity for proof as to what constituted a business district. There is one thing certain, though, and that is that the Automobile Club of Cleveland is determined to stamp out this evil. Actions already taken are beginning to have their effect.



MINNEAPOLIS REGULATIONS

The substance of the Minneapolis city ordinance is as follows: All persons operating machines must have a license. They must make application for the same before an examining board. They must not exceed an 8-mile speed limit in the business portions of the city nor a 25-mile limit in the outlying districts. They must not approach a crossing when a pedestrian is upon the same at a speed to exceed 4 miles an hour. The muffler must be used. A horn or bell must be provided for use in case of imminent danger. The operator should be governed by the law of the road—turning to the right when meeting a vehicle coming towards him in the opposite direction and turning to the left in passing a vehicle or person moving or headed in the same direction. At night the vehicle should be provided with a lighted lamp with white lens on front and a lamp in the rear with a red lens and a white lens so arranged as to cast a light upon the license number. These numbers must be 4½ inches in height. For failure to comply with any of these requirements a fine of not less than $5 nor more than $100 can be imposed or 10 to 60 days in the city workhouse meted out. The state law is very similar in every respect, but in addition specifies that when an operator is signaled by a driver of horses he shall stop his machine until the horse vehicle has passed the danger point.

NOT LIABLE UNDER OHIO LAWS

Mrs. Edith M. Bailey, the Cleveland, O., society woman charged with manslaughter as the result of running over a laboring man on the viaduct last August, has been released after a series of harassing examinations and trials. The coroner's jury exonerated her, but she was tried before the police court and bound over to the grand jury for further trial. Her release was due to the decision that she could not be held for criminal negligence under present Ohio laws. It was stated that under the existing laws and recent decisions of the supreme court there is no such thing as criminal negligence in Ohio. A similar case was decided by the Ohio supreme court a short time ago, when a man riding on a bicycle in violation of an ordinance, killed another and the supreme court held there was no law under which he could be held for the alleged negligence. This is a parallel situation in every particular. The same question was raised during the coroner's investigation at Mentor, O., of the recent wreck to the Twentieth Century limited. It was held that even if the wreck was due to someone's negligence, the person to blame could not be punished.

LACQUER FOR BRASS

Chicago—Editor MOTOR AGE—MOTOR AGE will probably win the lasting gratitude of a large number of its readers if it is able to publish the name or formula of an enamel or lacquer which could be applied to highly polished brass work, lamps, etc., to retain their brightness without being affected by the weather, grease or gases. Most polishes leave the surface in such a chemically clean and raw condition that moisture quickly attacks and tarnishes it. Grease paste polishes make a less brilliant but more permanent polish, but in some localities polished brass loses its luster very quickly regardless of the kind of polish used.—V. A. MATTESON.

Lacquering to be properly done requires considerable patience, and facilities which are not usually at hand. A brass polisher would better do this. All lacquers are more or less influenced by the weather, so it is doubtful whether a lacquer could be obtained that will be at all permanent. The amount of ammonia in the mud would soon discolor the lacquer. Experiment might produce something for the purpose, but MOTOR AGE cannot render assistance in this direction.

COIL TROUBLES

New Paris, Ind.—Editor MOTOR AGE—I have a three-terminal Dow coil for a motor cycle which gives a very intense spark at the contact but which burns through the finest platinum in a short time. The motor seems to run well as long as the points last, but will not run at all with anything but the finest platinum. The secondary seems to make a good jump but rather bushy and red and does not appear as blue as the primary. At times there occurs a faint click in the coil; then the report is not so great at the contact. Is the four-terminal coil easier on contact points and does it give a better spark, as claimed?—SUBSCRIBER.

There will be no advantage in using a four-terminal coil. Three cells of dry battery may be sufficient for the coil you have, although fewer than generally used. The condenser has been injured so as not to perform its function. Do not try to repair this but ship it to the Dow people to have repairs made as they should be.

TROUBLE IN STARTING

Cedar Rapids, Ia.—Editor MOTOR AGE—I am having considerable trouble in starting my four-cylinder car these cold mornings, often having to prime the cylinders. After the engine starts one or more of the cylinders will miss for from 5 to 6 minutes. After that it is all right the rest of the day. I know the battery and connections are in good shape. What is the trouble and can the same be overcome with little trouble?—W. M.

It is well known that gasoline will not volatize as readily in cold weather as when it is warm. The probability is that the gasoline feed to the carbureter is adjusted to such a close point that there is not enough volume to give off a sufficient vapor. Adjust the needle valve so as to give the carbureter more gasoline. If this does not remedy the trouble then it is likely that the supply of air is too great and the air intake should be cut down.

HOT RIVETING

Buffalo, N. Y.—Editor MOTOR AGE—In the construction of the frame of an automobile which is better, to have the parts of the frame hot riveted or cold riveted?—J. JONES.

Cold riveting is generally used in automobile construction. The joint made is perfect and strong. There is no change in the size of the rivet when riveted cold. The hot rivet necessarily contracts in the shank. The cold process does away with the fire and additional labor to handle. Cold riveting in modern plants is performed by a pneumatic riveter, which produces a better job more quickly done.

ACCESSIBILITY

Reading, Pa.—Editor MOTOR AGE—Your communication from your London correspondent in your issue of October 12 re the Duryea system seems to have been written by someone not fully acquainted with the facts. The fact that the English Duryea company is looking for capital is no reason for a criticism of the system or of the men behind it. It is a fact, to which we point with pride, that the Duryea vehicle is one of the very few vehicles that has been put on the market in a small way and with an exceedingly small amount of capital and that has continued to be manufactured and show evidence of growth. If this is a losing fight, then we are unable to see it. It is to us evidence of merit and vitality of the highest order. The failure to catch on must be attributed to lack of quantity instead of lack of style, for it is clearly impossible that a vehicle made in small quantities can be sold and delivered in large quantity, and it is also impossible to deliver in large quantity without sufficient capital to build in large quantity. It is also well known that capital is particularly timid about taking up advanced things. Any well informed man can point out plenty examples of this. Bell Telephone stock found no takers and I have friends who sold Standard Oil stock in its early days in order to purchase something supposedly better. That the engine in the Duryea is inaccessible is another error, for the reverse is the truth. All the motor bearings can be reached in 30 seconds for adjustment and any part of the vehicle can be removed in ½ hour. I feel safe in saying that on an average the parts of a Duryea vehicle taken one at a time, can be removed in one-fourth the time that similar parts of other vehicles require. Every mechanic knows that the power should be near the work and if the designer knows how, he can put all the power required under the operator's seat, as is done in the Duryea. This means that sooner or later motors will again be located at the rear of the vehicle instead of at the front. The reasons for this location are too many to be given in this short letter, but it will give me great pleasure to state some of them in an article on this subject and also to see a vigorous defense of the motor in front by some of those people who prefer reaching over muddy wheels, removing muddy fenders or leaning over a hot radiator in order to get at a motor placed in front in order that it may be sold to the public as accessible.—CHARLES E. DURYEA.

ANTI-FREEZING SOLUTION

Motor Age recommends the following as the best anti-freezing solution, all things considered: Use 4½ pounds of pure calcium chloride to a gallon of warm water. Mix and filter before placing in radiator or tank. Replace evaporation with clean water and leakage with solution. Calcium chloride can be procured from any wholesale drug house, commercially pure calcium chloride selling in the wholesale houses at 5 cents per pound in 50-pound lots. It ought to retail for about 8 cents per pound. Most automobile supply houses can supply it also.

PRONUNCIATION OF CHAUFFEUR

Birmingham, Ala.—Editor MOTOR AGE—I would like to know the correct pronunciation of chauffeur. Is it pronounced "shaffer," with the accent on the first syllable, or "shaf-four," with the accent on the last syllable?—R. W. M.

Neither is correct. It is almost impossible for any but a Frenchman to give the exact pronunciation and it is still more difficult to put such a pronunciation in cold type, as MOTOR AGE has said before. As near as can be told in print the word should be pronounced "show-fer," without accent.

CHOICE OF CARBURETERS

Grinnell, Ia.—Editor MOTOR AGE—Please tell me what is the best carbureter for a Pierce stanhope. Mine has never given satisfaction. I am afraid to go any distance from home. Please answer in the columns of the Readers' Clearing House. —K. B. W.

It is a rather difficult matter to select a maker of carbureters as having the best without seeming to show a favorable prejudice. MOTOR AGE can only advise writing to the carbureter manufacturers advertising in this issue.

Automobile Development

Silent Knight Touring Car

THE Silent Knight, which bears out its name, is a new 35 horsepower touring car manufactured by Knight & Kilbourne, Kingsbury and Huron streets, Chicago, Ill. It is fitted with a vertical four-cylinder, four-cycle motor, which differs very much from anything previously brought out by the gasoline fraternity, not only in America but Europe as well. The cylinders are unique in that the ordinary mechanical inlet and exhaust valves are done away with and in their place is a pair of reciprocating sleeves in each cylinder between the cylinder casing and the piston. In these sleeves are ports for admitting mixture and letting out the exhaust. In addition to this novelty, the makers have a perfectly spherical combustion chamber, the head of the piston and cylinder both being concaved and the spark plug placed in the center of the latter, giving a spark nearly in the center of the chamber.

Charles Y. Knight, the inventor, has in his development of the sleeve proposition as a substitute for valves, kept before him the securing of four points in gasoline construction—absence of pounding poppet valves, spherical combustion chamber, intake and exhaust openings at opposite sides and an exhaust in the bottom part of the cylinder through which the hot explosion gases pass without traveling back through the length of the cylinder to the top exhaust ports.

The Silent Knight car has been well tried out and the working of the sleeves tested, as well as the cooling and lubrication of them studied. One car has within the past season traveled over 6,000 miles and on examination the sleeves have been found by micrometer not to have worn. During that period of testing the lubrication system has worked without trouble, and to show that the cooling system offers no difficulties, the motor has often been run without water in the jackets. Another car has been in commission for over 1 year and another has been used for a shorter time. The company is pushing the completion of its first cars for the market and will put out from twenty-five to fifty for 1906.

Without reservation the Silent Knight's four-cylinder gasoline engine can be termed a sweeping innovation in the realm of gasoline engines, being built as it is without poppet inlet and exhaust valves as used in the regular four-cylinder gasoline motor. Every user of gasoline automobiles is familiar with the circular valves, with long stems surrounded by heavy coil springs for holding the valves closed and also with the push-rods and camshaft within the crank case for opening the valves at the proper time.

In the Silent Knight two sleeves work between the piston and the water jacket casing and in these sleeves are similar inlet and exhaust ports that register with one another and that conjunctively pass over the stationary port to the exhaust or intake pipe through the water jacket casing for taking in or expelling mixture, and during exhaust strokes and during the compression and explosion strokes do not register with one another, nor do they open to the cylinder chamber during pressure, thereby keeping the cylinder an enclosed chamber similar to the valve type of today.

The construction of the cylinders can best be followed from a passing study of the vertical end section, shown to the right of the vertical side section of the motor. The casings, cast in pairs and water jacketed, have the walls A made with a ¾-inch water space and are bolted to the top of the crank case B. The cylinder head C differs from the ordinary in that it sits into the top of the cylinder as a cork in the neck of a bottle, being bolted at the top by a flange with vertical bolts to the top of the cylinder walls. Between the head and the wall is quite a wide space, L, in which the sleeves have room to move up and down. On the head are four compression rings as in the gasoline piston, these rings serving to hold the compression between the head and the inner sleeve. The inner sleeve, H, is next to the piston, is machined all over and has a wall 3-16-inch thick. It has on the bottom at the left side an integral lug M by which it is secured to the short connecting rod O that has its other end attached to the eccentric shaft Q, which corresponds with the cam shaft in the ordinary gasoline engine. The outer sleeve K has a wall thickness of only 1-16 inch and works between the inner sleeve and the cylinder walls. It, too, like the inner one, has on its lower side, shown at the left, a lug N for securing to the short connecting rod P that joins the sleeve with the eccentric shaft. This eccentric shaft is gear-driven by gears on the front end of the crankshaft, the gears being proportioned on a two to one principle so that the eccentric shaft is driven at the same rate as a camshaft, the sleeves H and K being moved up and down just half as often as is the piston. The movement of each of them is but 1 1-16 inch, while the piston has a stroke of 5½ inches. The sleeves are made from gray iron and are turned on specially made jigs so that uneven grinding is impossible. They are a snug fit, the outer one in the cylinder casing and the inner within the outer.

Both of these sleeves have three ports or openings in their walls, two on opposite sides near the top and one at the bottom. The latter one is shown at R and is what is commonly known as an auxiliary exhaust, which in this case is the main. This port is made by cutting out of the sleeve a strip of metal 5-16 inch wide and equal in length to half of the circumference of the sleeve, the size of the port if made on a flat piece of paper would be an oblong 5-16 inch wide and 7 1-14 inches long. This port is so located that when the piston is on the explosion stroke the port begins opening, when the piston is approximately ½ inch from the bottom dead center and remains open until closed by the piston on the exhaust stroke, the crank pin thus traveling about 100 degrees while the port is entirely or partly open. The port R in the illustration is shown as it actually is when the piston is at the bottom dead center on the explosive stroke, the ports in both the outer and inner sleeves registering perfectly, as both are the same size and both registering with the exit opening G through the cylinder walls from which leads a separate muffler piping.

The ports in the top of the sleeves are more complicated. Mixture enters at the left side, in the illustration, through the opening E, and in the outer sleeve is shown the port T considerably above the inlet opening in the cylinder casing, while the port V in the inner sleeve is just opposite or registering with the top part of the intake opening. On the opposite side of the illustration is the scavenging exhaust port F in

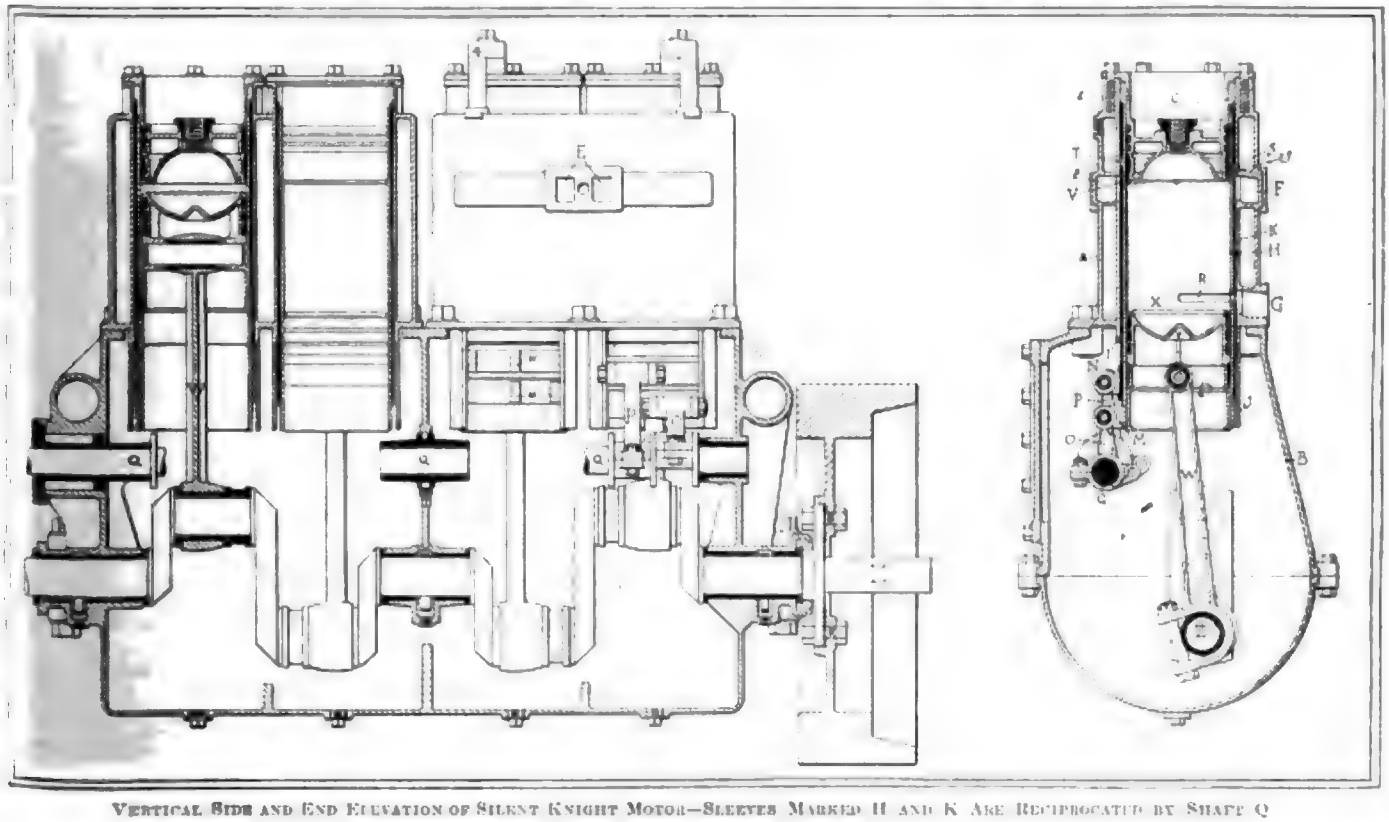
Digitized by Google

the cylinder casing, and in the inner sleeve is the port U and in the outer sleeve the port S. It will be remembered that the piston is just at the bottom of the explosion stroke and that the exhaust stroke is about to commence, the majority, 90 per cent, the makers claim, of the exhaust having passed out through the main and bottom port, and as the piston rises, the sleeves on this stroke are drawn down so that the ports U and S in the sleeves will register perfectly and both will move down and register with the opening F, which is connected by pipings with the muffler. As is in the view, neither U nor S register with F during the first portion of the exhaust stroke, when the lower or main exhaust is open, but both are later brought into perfect register and a free passage offered to the remaining gases. This divides the high and low pressure exhaust, preventing back pressure from the high pressure port during the scavenging portion of the exhaust stroke. This system is further carried out by the intervention of an extra muffler in conjunction with the main exhaust muffler. Looking across the illustration it can be seen that the inlet ports are closed by the thin outer sleeve. This inlet port is not opened until the piston is slightly past the top dead center after the scavenging exhaust ports close and the suction stroke commenced, thus making it impossible for the exhaust gases to enter the inlet pipings. When slightly past the top dead center the inlet ports on both sleeves register with the port E and such register remains until the piston is slightly past the bottom dead center and the compression stroke commenced. The inlet port in each sleeve is 5-16 inch wide and practically 5 inches in length, so that a port of 5-16 by 5 inches is open on the whole suction stroke for admitting mixture. The exhaust ports on the top and the intake ports are of the same size. So that the exhaust ports on the right side do not remain open, as it were, while the inlet ones on the left are in register, it can be noted that the former ports on the inner sleeve are slightly higher than the inlet one and that on the outer sleeve the inlet port is slightly higher than the exhaust. The sleeves are set so that the inner one leads the outer at all times by ⅛th revolution of the eccentric shaft.

From the illustration it can be noted that the cylinder walls project considerable into the top of the crank case, the part J at the right being practically as low as the bottom of the piston, but on the side of the piston next to the connecting rods working the sleeves, the cylinder wall is cut away, the short remaining part shown at J, this being done in order that the sleeves may be reciprocated. In the side view of the engine, in which the two inspection plates of the crank case are removed, the construction of the eccentric shaft can be studied. It is a three-bearing shaft with a diameter of 1⅛ inches for all bearings. The shaft is turned from a solid forging and made with the end bearings, in the ends of the crank case the front one 3½ inches long, and the rear and center ones 2½ inches. The bearings are made from bronze with a babbitt lining. The sleeve connecting rods are made from bronze; those working the inner sleeve, being 2¼ inches from center to center and those for the outer sleeve 3⅜ inches from center to center. The attachment to the two lugs, M and N, on the bottom of the sleeves is by distance sleeve on cross bolt and where they are secured to the eccentric shaft a hinged cap is used, the cap being held at the side opposite to the hinge by a screw bolt, nut and cotter pin, oiling arrangements being provided for the interior of the bearing.

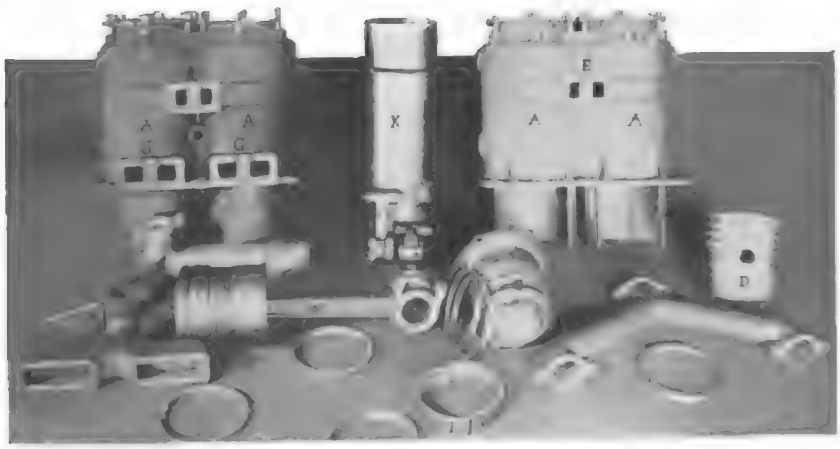
The crank shaft is a four-throw forging with the throws set at 180 degrees, the center and end ones being arranged in pairs. The shaft, with a diameter of 1⅝ inches, revolves on three bearings, two end ones and a middle one between the pairs of cylinders; the end bearings are 3¼ inches long and 1⅝-inch in diameter, and the center one is 4 inches long and has a diameter of 1⅝ inches. The crank pin bearings are 3¼ by 1⅝ inches, and the wrist pin bearings 2¼ by ⅞ inches. All bearings are made from bronze with babbitt linings and in the latter are cut angular grooves for the distribution of the lubricant. On the rear end of the shaft is a 6-inch integral flange, turning with the shaft and to which the flywheel is bolted and keyed; the latter has a rim weight of 110 pounds and a diameter of 16 inches. The crank shafts are hardened and finally ground to size all over.

The crank case offers some slight novelties in its construction. Aluminum is the metal used exclusively. The case proper resembles an oblong box with the depth and width practically equal. The bottom is entirely open and receives the bottom part of the case, which serves as an oil basin and aids in carrying the end bearing of the crank shaft, the center bearing of the shaft, however, being carried entirely on the top part of the case, admitting of the bottom part being removed without interfering with any of the motor parts except the end bearings. In the top of the case are two oblong openings, in which the pairs of cylinders rest, being bolted in place. In the left side are two big inspection holes covered by aluminum plates secured by thumb screws. The case is partly divided between the pairs of cylinders by a partition which provides a central bearing for the crank and eccentric shafts. A subframe is not used, but in the side views of the motor can be seen V-shaped projections on either end of the top part of the case with large cross holes in each.



VERTICAL SIDE AND END ELEVATION OF SILENT KNIGHT MOTOR—SLEEVES MARKED H AND K ARE RECIPROCATED BY SHAFT Q

Digitized by Google



CYLINDER CASTINGS, SLEEVES, PISTONS, CYLINDER HEADS AND PISTON RINGS

Through these holes passes Shelby tubing, extending from one side piece of the main frame to the other, and secured to each by pillow-block brackets. Collars and tapered pins will be used on the tubing to prevent the slipping of the motor crosswise on them.

Motor lubrication follows new lines in that the much talked of splash system in the bottom of the crank case is not used. There is, however, beneath each crank throw four oil sprays for furnishing all lubricant. From these sprays the oil is sprayed by pressure feed over the crank shaft bearings and also over the crank pins, and all oil falling in the bottom of the case immediately runs out into the oil reservoir from which it is again passed through the spraying nozzles. The lubrication of the sleeves was looked upon by many students of the Silent Knight as one of the most difficult features of its construction, but as the proof of the pudding is in the eating, so the test of the lubrication is in the running and in this the Silent Knight has not experienced the slightest difficulty. Oil is fed into the top part of the cylinders in the space marked L between the cylinder heads and the walls and in which space the top of the sleeves work. In this way the oil works between the two sleeves as well as between the inner sleeve and the piston and between the outer sleeve and the casing wall. The real place, however, to lubricate is between the piston and the inner sleeve, as here is the fastest movement and consequently the greatest friction. But this is not so great as between the ordinary piston and the cylinder. In this case, when the piston is traveling on the up stroke, the compression one, the inner sleeve is moving up with it, not so fast it is true, but while the piston travels 5½ inches, the sleeve travels 1 1-16 inches in the same direction and on the down stroke, the explosion one, the sleeve travels with the piston at the same relative speed. On the suction and exhaust strokes the inner sleeves and the piston are traveling in opposite directions. Between the sleeves the amount of oil needed can be estimated from the fact that the travel of each is but 1 1-16 inches and that most of the time they are traveling in the same direction, though not always at the same speed. Between the outer sleeve and the cylinder wall the movement is a reciprocation of 1 1-16 inches, half as often as the piston reciprocation. The oil flows and works between the sleeves and the ports being so large in the sleeves the makers claim that by simply injecting oil into the cylinder wall between the casing and the outer sleeve that it will soon work through the ports, down between the sleeves and between the inner sleeve and the piston. The top of the piston being hollowed there is a danger of the oil flowing into the cavity, which, however, is prevented by the vertical flange around the piston heads shown at X. Furthermore the conical raise, Y in the center of the piston head prevents accumulation of residue oil at the center or extreme bottom of the cavity at the back of the piston and in turn prevents direct splash up to the spark plug point, located in the center of the cylinder head, causing the splash to take place in ring form around the sparking center.

Motor cooling is accomplished by water jacketing the cylinder casing, and also the cylinder heads, the water to the latter being transferred from the general water system through the tubings, 4, passing over the tops of the cylinders. In the 6,000 miles the demonstration car has run, cooling difficulties have not been encountered. The inner sleeve, working next to the piston, is naturally the source of the greatest heat generation, but this sleeve, it will be remembered, is traveling in the same direction as the piston on the two heat-producing strokes—the compression and explosion strokes. In each of these strokes the piston travels the full length of the stroke—3½ inches—but while doing this the sleeve travels 1 1-16 inches, so that in reality one-fifth of the travel of the piston is done away with. The top of the sleeves—that part around the combustion chamber—will come in for the greatest amount of heat, and, as can be seen in the end section, the tops of the sleeves are passing between the two water-jacketed surfaces—the water jacketed cylinder casting on one side and the water-jacketed cylinder head on the inside. In defense of this scheme, the makers claim that the reciprocation of the sleeves, one within the other, aids in distributing the heat over a long surface instead of keeping it in one place. Water circulation is maintained by a gear-driven pump, connected in the circuit with the radiator. Behind the radiator is a fan for cooling.

The compression rings in the piston are three in number, placed in the top part of the piston. The wrist pin, instead of being pinned in place, is held by a broad snap ring, 3, shown in the side view. In the cylinder head are three compression rings against which the inner sleeve works and in the lower part of the head is a broad cut-off ring composed of two semi-circular parts, marked 1, within which is an expansion ring for holding them against the sleeve.

The Silent Knight car, apart from the motor, follows stand-

HERAULT'S METAL TREAD TIRE

ard lines of construction. Transmission from the crank shaft is through a friction clutch and three-speed and reverse sliding gear transmission with shaft drive to the live rear axle of the floating type, Pressed steel is universal in the frame construction. The wheel base is 112 inches, the weight 2,600 pounds and regular artillery wheels and pneumatic tires are fitted. Ignition is by jump spark with the batteries, coil and commutator carried in the battery box, so that the only portion of the system visible is the four cables to the plugs and the plugs themselves.

BRINGS OUT WOOD TIRE

All manufacturers, and especially users of heavy motor vehicles of the commercial class, know that the item of keeping tires in good order is an expensive one and necessary as well. Rubber is now almost exclusively used, but there are indications that wood will be used very extensively in the future. The illustrations shows a heavy truck wheel manufactured by the American Wood Tire Co., of Chicago, Ill. The construction of the tire is such that each individual wood block is clamped tightly so that it cannot get out of place. Means are also provided whereby any desired portions of the tire may be repaired or new blocks inserted without removing the whole tire. Wood is claimed to possess a number of advantages over rubber when used in a vehicle tire, but practically the only advantage which rubber has over wood is its elasticity. Wood is a great deal cheaper than rubber, even when it is specially prepared and treated so as to better withstand the influences of weather. It will wear fully three times as long, size for size, especially under heavy pressure and rough usage. Its slipping on wet pavements, especially under a load, is scarcely noticeable. On macadam little, if any, slipping takes place. Engineers consider wood one of the best materials for transmitting power in either wet or dry places or where it is wet part of the time and dry at other times. Large frictional disk wheels with their working surfaces provided with wood blocks wedged in an iron frame are known to have stood for years of continual running in all kinds of weather, summer and winter. Grit and sand have little effect on the wood surfaces because at the start the sand grains become embedded in the wood, forming a surface practically smooth and almost as hard as metal.

PEUGEOT IDEA OF A MUFFLER

Perhaps the most interesting muffler brought out in Europe during the last 6 months is the Peugeot, now used on these well known French machines and a modification of which is installed on the commercial machines built by the same concern. The muffler is a cylindrical chamber hung lengthwise in the chassis frame, with the gases coming direct from the motor into the lower part of the front end of the chamber. The exhaust pipe from the motor is continued within the muffler in the form of a large-diameter tube closed at its inner end. Within it is a series of little transverse tubes through which the gases escape into the center of the muffler chamber. These cross, or transverse, tubes are arranged as shown in one end of the illustration, being so arranged that all of the gases must pass through them when part of the heat is extracted. The gases must leave the muffler through another pipe in the opposite end. This pipe, like the one through which the exhaust enters, is enclosed at its inner end and contains a series of cross pipes within it, through which the gases from within the muffler have to pass before getting to the atmosphere. These pipes are arranged, as shown in the cross illustration at the upper left, the gases entering the ends which register, with numerous perforations in the pipe, and passing through them into the common center of the pipe. The object of the cross pipes in both the pipe conducting the gases to the muffler and in that conducting them out is that the walls of the short transverse tubes will extract a great deal of the heat out of the gases thereby contracting them. The inlet and exit pipes are separated by a partition in the muffler casing so that in passing from one pipe to the other gases must go through the large chamber.

METAL-TREAD HERAULT TIRE

The Herault pneumatic tire, a recent French invention manufactured at 120 boulevard Magenta, Paris, is made with a metal tread permanently united with the tire casing. In the latter the ordinary rubber and canvas is made use of; the interior part being layers of canvas separated by slight thicknesses of rubber and on the exterior are several thicknesses of rubber. On the tread is a heavy leather strip encircling the tire and on the center of the leather strip is a double series of metal blocks, alternate blocks being almost square and not equal in width to one-third of the tire tread. The others are slightly oblong in shape and of the same width. Each metal block is rounded at the front and rear edges but straight at either side, so that no roughness is occasioned by straight edges hitting rough places on the road and having the sides straight prevents slide slipping, the straight edges producing greater friction with the road surfaces. Each metal block is retained by a central rivet in case of the square ones and by two rivets in the oblong ones. These rivets pass through the metal in the block, through the leather strip, securing it in place, and through all the thicknesses in the outer tire casing, binding all tightly together. As a protection for the air chamber, the heads of the rivets are covered with a strip of rubber on the inside of the casing. This strip is vulcanized or cemented in place after the rivets are fastened. As can be noted in the vertical section of the tread, the metal blocks are sunk into the leather strip in the tread, the leather being cut out to assist in the process. In the black shaded part of the tire casing the rivets are slightly thickened so that in case the head becomes worn off the rivet will not become loose.

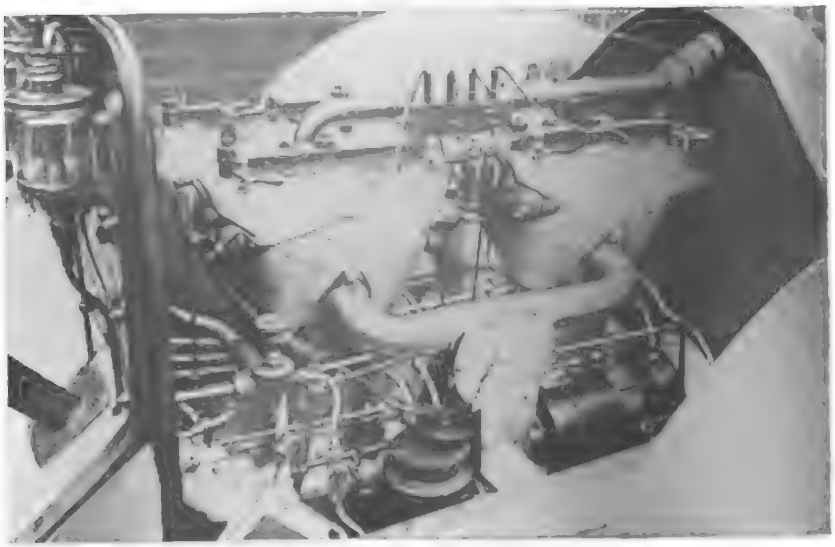
NEW 70-HORSEPOWER MERCEDES



THE 1906 MERCEDES MOTOR, SHOWING CARBURETER, MAGNETO AND GOVERNOR

MERCEDES automobiles for next year possess many new features, most noticeable being the decided changes in the four-speed sliding gear transmission, the carbureter with four spraying nozzles instead of one, the adoption of four brakes, two of which are water cooled, and in the attachment of the springs to the axles by a special spring, box through which the leaves of the spring pass and which is held to the axle by a single bolt passing vertically through the center of the axle. Among the retained features of construction are the scroll design of clutch, make-and-break ignition with magneto current, governor, hand and pedal control of throttle and spark timing lever on the steering wheel. Single lever control of the four forward speeds and the reverse is in keeping with modern practice.

The side pieces of the pressed steel frame are long and the well known Mercedes long curved spring hangers, permitting of the use of long semi-elliptic springs, are in evidence. All cross braces act not only as ties but supports for the gear case and steering column, those in front being the motor arms. A trough-like metal apron encloses the machinery plant from the starting crank to the rear of the transmission case, practically all of the bottom part of the chassis being an apron. The wheel base approximates 11 feet 1½ inches. The rear wheels, a little over 36 inches in diameter, are a fraction of an inch larger than the front wheels and are fitted with 5-inch tires, while 4-inch ones are used on the latter.

The 70-horsepower motor substitutes the 60-horsepower and follows Mercedes lines, with the valves mechanically operated, the inlets being in ports on the right and the exhausts on the left. A marked simplicity is given the induction and exhaust pipings, a single Y piping made integral with the mixing chamber in the carbureter serving to conduct the mixture to the two pairs of cylinders. In the exhaust a straight integral piping connects through a single opening in each pair of cylinders and at the rear of the motor elbows down and couples with a flexible tubing coupling to the muffler. A novel appearance is given each pair of cylinders by a distinctive taper to the bottom of the valve ports. The make-and-break igniters are hung practically in the same place, on the corners of the valve ports, but are a little more compact than in this year's machine. Almost above them in the valve port casting are little inspection cocks, easily removable, by which the points of the igniters within can easily be cleaned. Directly above the pistons in the cylinder heads are other inspection cocks, through which paraffin can be introduced for cleaning the pistons. The magneto is carried in the usual place and is driven by a separate shaft, connected by gears with the inlet camshaft.

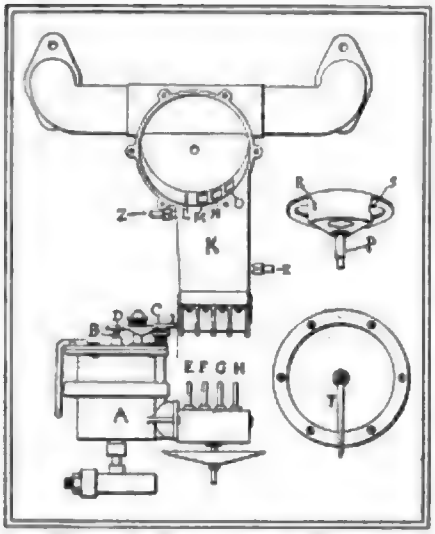
Driven off the inlet camshaft is the gear carrying the centrifugal water pump and fitted in connection with the exhaust camshaft is a half compression device used in cranking and which can be brought into play by a little handle in front of the radiator. The action of the half compression device consists in lifting the exhaust valves off their seatings on the first part of the compression stroke. The motor governor, of the centrifugal type, lies between the magneto and the spur wheel which drives them. It is not enclosed and the sliding sleeve is simply connected with the throttle valve. It is set to normally close the throttle as speed increases, but the throttle can be opened to any extent by hand or foot when desired, in the former case by a thumb lever on the steering wheel, and in the latter by an accelerator located on the footboard.

For lubrication a twelve-feed sight lubricator, occupying the center of the dash, and to the right a single plunger pump for forcing oil into the crankcase, are used. Oil is fed into the lubricator by pressure from a large tank on the left side of the chassis and a center stop cocks controls the oil passage. Of the twelve feeds, the majority pass to the motor, each motor bearing being furnished with a separate lead. Another runs to the steering gear. On the left of the dash is a separate oiler connected solely with the water pump bearings. In the view of the chassis, in which the dash and its parts are shown, can be seen on the left a thumb lever for turning the water onto the brakes on the gear box. In some models a push button in the footboard has served in this capacity.

Nothing in connection with the 1906 Mercedes is more noticeable than the new carburetor, a device bristling with novelties, but one that has been found capable of supplying suitable mixtures for all the varying motor speeds. The float chamber A is supplied with fuel through a needle valve B in the bottom of the chamber, but the passage of the fuel out of the float chamber is also controlled by a second needle valve C, which shuts off the flow to the four spraying nozzles E, F, G and H. On top of the needle valve C is the cam disk D, which is connected with a lever on the dash so that the flow of gasoline to the nozzles can be shut off by the driver. The four nozzles are vertical pipes connected to a common horizontal fuel tube and closed at the upper ends, the fuel passing out through radial holes, there being two very small holes in the nozzle E, two larger holes in F and G and four larger holes in H. The mixing chamber K is a part of the induction pipes, and in the illustration is shown considerably above the four nozzles in order that its construction may be more closely observed. It is divided vertically into four distinct compartments. One is for the passage of the mixture from each of the four spraying nozzles and in the top are the four exit passages, L, M, N and O, which are under the control of the throttle P, removed to show its construction, so that the mixture can be taken from any one or more of the spraying nozzles. The entire chamber is water jacketed, to be heated by pipes connecting at Z with the water system; or the exhaust can be used in heating. The four compartments of the chamber are open to the atmosphere at the bottom, so that the air rushes past

CHASSIS OF 1906 MERCEDES

Digitized by Google



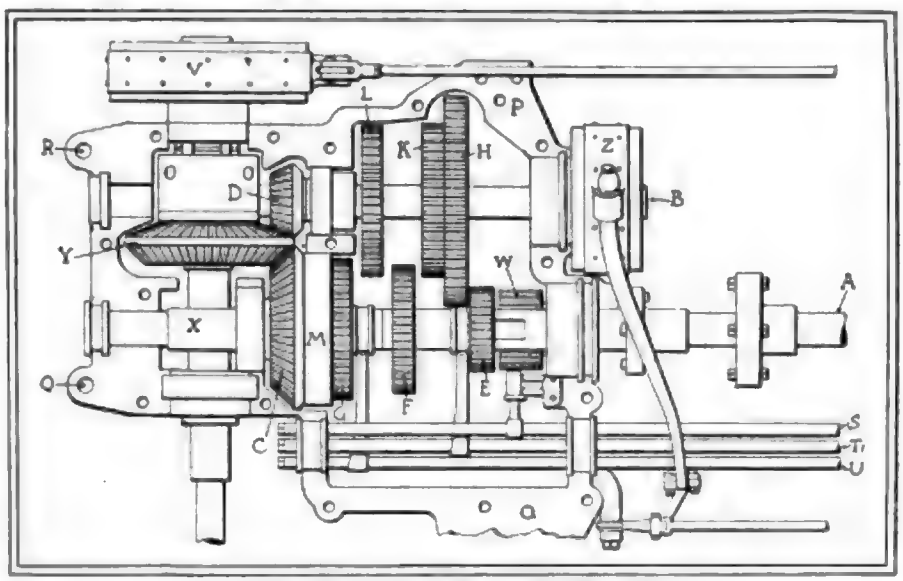
MERCEDES CARBURETER AND PARTS

the nozzles and, mixing with the gasoline, is conducted through the passages in the mixing chamber. The chamber surrounding the nozzle E is restricted, while the chambers enclosing the remaining nozzles are large, so that when E is the only nozzle in operation there is great injection action and sufficient carburation can be gained, even though the air supply to to the motor is limited. With the engine running very lightly the throttle is turned so that the opening R is brought to register with the opening L from the nozzle E before any of the other exits, O, N, or M, are opened, and in this position delicate changes of motor speed can be gained by slightly varying the size of the exit from the passage L. When more power is needed from the engine the throttle is brought into play and is moved further, so that the V-shaped opening S gradually commences to uncover the exit O, thereby bringing the nozzle H into operation. But just as the exit O is brought into use the throttle commences closing the exit L, thereby shutting off the nozzle E. A further movement of the throttle opens completely the exit O and then commences to open the exit N, bringing into service the nozzle G. After this exit is wide open the exit M commences to uncover and the nozzle F is brought into play. In this manner nozzle after nozzle is successively brought into operation until all of the three nozzles, F, G and H, are supplying mixture and the little one E is shut off, whereas at the start, when the motor speed is low, E supplied all the mixture and the others were closed. The throttle is moved through the medium of the arm T, coupled to the axle, on which it revolves. It is also connected with a thumb lever on the steering wheel. The use of an auxiliary air supply valve is eliminated by the four nozzles and the special throttle. Gasoline is carried in a large tank beneath the rear part of the chassis frame, with pressure used for feeding to the carbureter. A little improvement is introduced in having the filling pipe to the tank extended back so that fuel may be poured into it without the body of the vehicle interfering.

Transmission from the motor is through a four speed transmission and double side chains. Foremost in this transmission system is the large, fan-bladed fly wheel, so made for drawing hot gases from around the motor. Within this is the Mercedes scroll type clutch. This works on the principle of a rope wound several times around a revolving shaft, a slight pulling on the rope causing pronounced braking power on the shaft. It is operated by pedal. A long propeller shaft connects the clutch with the gear box, which is carried well back on the chassis frame, thereby making the driving side chains of medium length. Double universal joints with oiling devices are used on the shaft.

As expected, four forward speeds and a reverse are used in the Mercedes, three sliding units being brought into use. For support, the gear case is carried directly on the side pieces of the main frame through the side brackets O and P, and additional support is given in the rear by bolts at Q and R, uniting the gear box with a frame cross piece. Within the case the universal use of ball bearings is in keeping with Mercedes tendencies, but a startling innovation is discovered in that the main shaft A is supported at the rear end of the case by a bridge X partly spanning the differential shaft, and also in the fact that either of the bevels C or D can drive direct onto the double bevel Y on the spur-gear differential on the differential shaft. On the main shaft A are the two sliding gear units E and F-G, moved respectively through the use of the rods T and U. For the first, second and third speeds gears E, F and G are meshed with the respective gears H, K and L on the counter shaft B and the drive is then through the gear D to the bevel on the differential shaft and by double side chains to the road wheels. For direct drive gear G is meshed with the gear M, which is provided with internal teeth and thereby the drive is direct along the shaft A, through the gear C and through the differential and side chains. On this drive the gears on the shaft B revolve idly with the shaft and the gear D runs idly also in the differential bevel. The three rods U, T and S for getting the changes of speed are worked from a single lever, free to move either backward or forward in the alternate slots in its quadrant. The rod U merely moves the gear G into mesh with M for direct drive and removes it and also meshes G with L for the third forward speed. Rod T moves gears E and F, meshing them respectively with H and K for the first and second forward speeds, and in reversing rod S slides the very wide intermediate gear W, on a separate shaft in the bottom of the case, into common mesh with gear E on the main shaft and gear H on the countershaft, when the drive is through the countershaft and bevel D through the differential bevel and the side chains. The differential shaft in the new machine differs from that in this year's in that the end bearings are long and plain instead of self-retained balls.

In connection with the gear box are two independently operated foot brakes, one shown at V on the left end of the differential shaft, where regular brakes are usually found on double side chain drive cars, and the other on the front end of the countershaft B, which is projected for the occasion. This brake Z, like the other, is kept cool during constant brake application, as necessary when touring in mountainous districts, by a stream of water being directed inside of it, the water when desired being fed from a special water tank on the outside of the chassis frame adjacent to the dash. Both of these brakes are hand adjustable, tools not being necessary, the one on brake Z having a wing nut where the brake applying rod is connected and the one on V having a little hand wheel instead, either of which can be adjusted in a few minutes. The rear hub brakes are lever applied. The cover of the gear case is bolted in place, and has in top two inspection ports, one large one for reaching the sliding units and a smaller rear one for examining the differential and two bevel gears. The floor of the car is readily removable so that the gear case is accessible. The sprockets for double side chains on the ends of the differential shaft are large, being almost equal in size to those on the road wheels. Heavy roller chains are retained but chain coverings of any nature are not used.



FOUR-SPEED TRANSMISSION SET ON 1906 MERCEDES

Digitized by Google

Ford

slower speeds were the rule and the continued morning shower had increased the mud, which never lost a chance to get into the carbureter and cause a stop. Several incidents of this nature occurred and the driver almost lost his patience on one or two occasions as he cleaned the mud off, cranked the motor and started off, only to hit a deeper mudpuddle a few rods further on, when perhaps as good a shower of mud was administered to the uncovered machinery. The error of not inclosing the machinery entirely by a metal apron and thereby excluding all possible mud, grit, stones and other matter, was most apparent, as was the fact that machinery should be placed so as to be as convenient and accessible as possible so that examinations can be made without having to get underneath the machine. In commercial purposes the car must go in the wet and mud as well as in the fine and dry, and it is imperative that the construction of the machine be such that it is best for the worst possible weather.

Expenses of the trip for one of the machines amounted to practically 1 cent per traveled mile. Slightly less than 6 gallons of gasoline were consumed on the round trip and as the cost of it, in this case, was 8½ cents per gallon, the fuel bill amounted to 51 cents. To this must be added 1 quart of cylinder oil, worth about 15 cents, and the grand total is 66 cents for 33 miles out and 33 miles back, or 1 cent per mile. As 3,000 copies were delivered, the cost of delivery per paper amounted to .02 cent per copy, or 2 1-5 cents per 100.

MAXWELL TRUCK THE LATEST

Another name is added to the rapidly growing list of manufacturers of motor trucks in this country. The new comer referred to is the Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., which worked a little surprise on the automobile public at the Vanderbilt cup race on Long Island, when the leading members of the company toured from the factory to the race track in the new truck. The machine is intended for carrying loads from 1½ to 2 tons, and follows in its construction the design of the Maxwell touring car, having a pair of opposed cylinders placed crosswise in front constituting the motor, from which power is transmitted through a multiple disk clutch, sliding gear transmission and central shaft drive to the rear axle. The shaft drive feature is the one part of the transmission scheme that is not standard, as most of the commercial vehicles now used, whether light or heavy, drive by means of single or double chains. The practicability of shaft drive remains to be tested and its working will be followed with interest. It has the advantage, however, of being well suited for muddy weather when grit, mud and stones get on to the driving chains and sprockets and eat up considerable power.

The running gear construction consists of two pressed steel pieces terminating in front and rear with curved spring hangers, to which the respective ends of the four semi-elliptic springs are secured. In the axle construction standard lines are followed, heavy construction affording good strength is the important feature. All four wheels are 32 inches in diameter, but the front ones have 3½-inch tires and on the rear 4-inch ones. Both are of Firestone make with round tread.

Cylinders in the motor have a 5-inch bore and 5-inch stroke and at a crankshaft speed of 1,000 revolutions per minute 18 horsepower is claimed. Mechanical inlet valves are used throughout. A feature in connection with the engine is that any wear occurring on any of the engine bearings can be taken up without removing either the transmission or engine case cover, the adjustment being controlled by screws located in the bottom of the engine case. The engine and transmission case, a combined casting, with the former part in front and the latter centrally behind it, is an aluminum casting in which all the motor and transmission bearings are rigidly secured, making poor alignment of the shafting difficult, a fact worthy of note in commercial machines, where heavy loads and rough usage are apt to strain parts and, if they are carried on different parts of the chassis frame, interfere with their alignment. The entire case is hung on three points. When the interior parts have to be inspected the top of the case can be removed by loosening six bolts, when the part carrying the cam shaft and push rods on the top part of the case comes off and the crankshaft and connecting rods are laid bare. The transmission elements within the combined engine and gear case consist of the multiple disk clutch, which runs in oil and is operated through the medium of a heavy coil spring and a sliding gear set, giving three forward speeds and one reverse, the maximum forward drive being 18 miles per hour. All gears are made from drop forgings, the forgings being first cut out and then case hardened. The changes in speed are gained through one of the side levers at the driver's right. In the transmission plain babbitted bearings are used, but in the crankshaft of the motor bronze, with a shell lining of babbitts, is adopted. A safeguard against gear stripping when changing speeds is added in providing the gears with a suitable lock. Lubrication is attended to through a positively driven sight lubricator. Mixture is ignited by spark plugs in circuit with coil, commutator and either of two sets of dry cells.

Transmission of power from the gear case to the rear wheels by shaft has been decided upon because of the fact that few, in fact no defects are claimed by the company in its style of propeller shaft drive. In the shaft are two universal joints, each with special grease-containing facilities. In the rear axle Hyatt roller bearings are used instead of balls. In other lines the rear axle construction of the Maxwell touring car is used, except in that all of the parts are proportionally strengthened. The side thrust, inherent with bevel gear construction, is taken up by a blank roller of the same size as the driving pinion, this being fitted against the smooth bevel surface of the driving gear, holds the latter up to its work and renders false alignment difficult.

The design of the body part of the truck is little different from many now used. The seat is thrown high above the motor, leaving almost the entire top of the chassis to be used as a carrying platform, the measurements of which platform are 10½ feet in length by 6 feet in width, the extra width being gained by having the cross sills, carrying the platform, project well over the

MAXWELL 18 HORSEPOWER 1½-2 TON TRUCK

REAR VIEW OF TRUCK, SHOWING WIDE PLATFORM

Digitized by Google

DAIMLER STEEL TIRED 13,200-POUND TRAILER, WITH TARPAULIN COVERS

tops of the rear road wheels, as can be noticed in the rear view of the truck. Beneath the dashboard, in fact directly beneath the footboard, is the cellular radiator, with the projection of the crankshaft, for the starting crank projecting through the lower part of it. A dash is eliminated, the little inclined footboard, common on express wagons, being the only body part in front of the driver. The controlling devices are centered around the vertical steering column, the throttle and spark levers being on the column just below the steering wheel; the clutch and brake pedals in the footboard and the change speed and emergency brake levers at the right, the whole design being in conformity with touring car principles. Sides of any desired nature may be used, the stake back and combined stake and running board sides being used on the truck illustrated.

GERMANY HOLDS VAN TRIALS

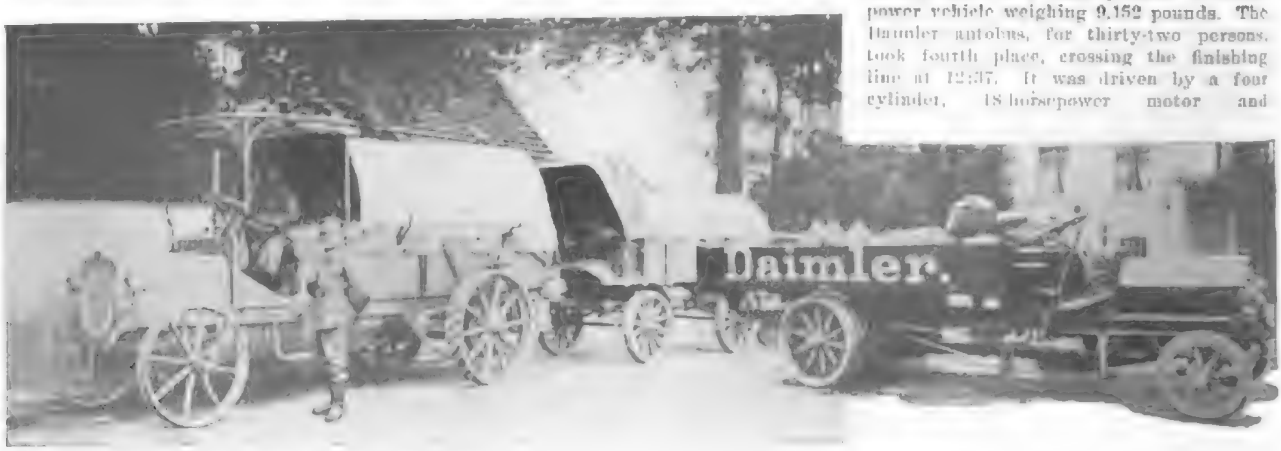
The Automobile Club of Germany conducted trials of heavy and light commercial wagons and passenger buses over the roads in the vicinity of Berlin from October 9 to 14 inclusive. The competing vehicles were divided into different classes according to their load carrying capacity, and two distinct routes were used on each day's tour; one route, averaging 60 miles per day, was for all passenger buses and delivery and merchandise vans carrying loads of less than 6,600 pounds. The second route, of approximatey 41 miles per day, was for trucks and delivery wagons carrying loads of from 6,600 to 13,200 pounds and for trailers transporting at least 6,600 pounds. The roads selected for each route were through sections of the country not well supplied with railroad service, one object of the tests being the hope of impressing upon the population in these places the advantages of the motor wagon for transporting passengers, freight and baggage over horse-drawn methods. The passenger buses carried at least ten passengers—some carried thirty—and they had to have provisions for carrying 55 pounds of baggage for each passenger. In the first 2 days of the trials, of the fourteen cars started two fell out, twelve finishing. Two cars were scratched. The two break downs occurred in the first day's run. One was a beer truck in which the motor was coupled to a running gear that had not been in use since 1898 and the steering gear failed to work, ditching the machine. The other break down occurred to the Daimler 6,600-pound truck.

On the first day the route was from North Berlin to Gransee, the long route being 60 miles and the short one 41¼ miles. The long trip was through Tegel, Schulzendorf, Marwitz, Eichstaedt, Kremmen, Linum, Fehrbellin, Alt Friesach, Herzberg, Lindow to Gransee. The shorter route went through the towns of Blankenfelde, Libenwalde and Zehdenick. The roads throughout are a wide strip of macadam, perfectly dry on that day.

As an evidence of the interest taken in the event, several hundred prominent French, English and Belgian motor students followed the big machines over the course in automobiles, along with the German manufacturers interested in the showing made by their machines entered in the test. The machines comprised several passenger buses with seats for thirteen and thirty passengers and a milk delivery truck capable of carrying 218¾ gallons of milk. The truck is the product of the Daimler firm and is made for use in the provinces where the dairy products for the large cities are collected from the farms and brought to the railway stations. A baggage van for the Daimler concern was also in the list of entries, capable of carrying 1,650 pounds.

Heavy brewery and merchandise trucks also were among the competitors. The Boehmischen brewery wagon, a two-cylinder, 10-horsepower machine, started with the others, but an accident to the steering gear delayed the entry at Forsthaus Sumb long enough to put it out of the running. The first of the machines to cross the finishing line at Gransee was the Verkehrsgesellschaft "Gernsbach," the thirteen-passenger bus from the factory of the Southern Automobile Co., in Gaggenau, which left Berlin at 7:06 in the morning and reached Gransee at 11:39, having covered the 60 miles of the long course in 4 hours and 33 minutes. The car was laden with stone ballast and also carried three persons in addition to the required weight. The average of 13¾ miles per hour is considered exceptionally good for thirteen passengers. The second to finish over the long route was the milk wagon laden with its 1,650 pounds of weight which covered the route in 4 hours and 55 minutes, arriving in Gransee at 12:06 o'clock.

The twenty-seven passenger bus of the Buessing firm got into Gransee at 12:37 and secured third place, having left Berlin at 7:35 o'clock in the morning. The machine is capable of carrying 7,700 pounds and is a four-cylinder 25-horsepower vehicle weighing 9,152 pounds. The Daimler autobus, for thirty-two persons, took fourth place, crossing the finishing line at 12:37. It was driven by a four cylinder, 18 horsepower motor and



N. A. G. 13,200-POUND TRAILER, WITH STEEL TIRES

DAIMLER MILK WAGON FOR PROVINCIAL USE

Digitized by Google

weighs 10,340 pounds. The other cars came in at short intervals, the Daimler car, with a trailer carrying 13,200 pounds, arrived after having covered the short 41-mile course in 5 hours and 17 minutes.

Out of the fourteen cars which started twelve finished. The two which did not get away were the Rosenthal and the Garrett & Smith Co.'s steam truck of 25-horsepower with a two cylinder motor; coke was used for fuel in this machine. The two which started, but did not finish, were the Boehmischen beer truck, before mentioned, and the new Daimler truck for carrying 6,600 pounds weight, which broke down at Herzberg.

The mayor and aldermen of Gransee were out to receive the incoming tourists and a banquet was given to the principals. In the afternoon the townspeople visited the yard where the big machines were stored after the long trip.

Following is the list of cars and the order in which they finished:

Car	Left Berlin	Distance, miles	Arrived at Gransee
5. Daimler 13-passenger bus	7:00	60	11:30
3. Daimler 218 gallon milk wagon	7:11	60	12:06
1. Buessing 27-passenger bus	7:35	60	12:37
2. Daimler 32-passenger bus	7:04	60	12:40
10. Daimler 13-200-pound trailer	7:27	41	12:44
8. N. A. G. 3-300-pound milk wagon	7:15	60	1:18
15. Truck with trailer, N. A. G. trailer	7:25	41	1:28
12. Daimler 13-200-pound truck	7:23	41	1:29
9. N. A. G. 7-700-pound truck	7:18	41	1:37
14. Continental 6,000-pound truck	7:19	60	2:11
6. Daimler 7,700-pound delivery	7:12	41	2:31
4. N. A. G. 1,600-pound delivery	7:00	60	2:42

The second day's journey from Gransee to Neubrandenburg, a distance of 78⅓ miles, lay through a beautiful farming region and the roads, wet from recent showers, were in excellent condition for the test. As on the first day's stage, the Daimler omnibus for thirteen passengers finished first, covering the distance in 4 hours and 56 minutes at an average speed of 15½ miles to the hour. Number 7, which broke down at Herzberg on the first day reached Neubrandenburg at 10:30 o'clock Tuesday evening. The order in which the cars finished the second day's run was as follows:

Car No.	Left Grandsee	Distance miles	Arrived at Neubrandenburg
3	7:28	70	12:24
16	7:42	43	1:31
15	7:43	43	1:51
2	7:29	70	2:20
12	7:33	43	2:21
5	7:39	70	2:47
1	7:25	70	2:49
9	7:41	43	2:52
4	7:47	43	3:15
10	7:31	70	3:55
8	7:52	70	4:00
6	7:30	43	4:26

LAUNDRYMAN EXPERIMENTS

E. V. Johnston, proprietor of the Domestic laundry, located at 119-121 South Main street, Wichita, Kan., and a very matter-of-fact experimenter with the motor car for use in delivery work in small places, writes as follows to MOTOR AGE regarding the experiences he has had with a commercial wagon in delivering laundry in and around his city.

"I hardly know if I am entitled to the credit of running an automobile delivery wagon. I have a light touring car, and, being very much interested in the question of delivery service with an automobile, had built for it a body which I could attach by removing the tonneau, believing that I could experiment with this without too much expense, and form a pretty good idea of the possibilities of the service for this city. We have comparatively a small amount of paving in Wichita, but on the other hand the nature of the soil is such that the ordinary road can be used practically all the time. The distances are not long between stops for delivery, the population being about 35,000; no wagon exceeds 3 miles from the plant. I have been covering the town with three wagons, using five horses, so that I could rest two at a time. I planned to use the automobile part of the time on each route, on the theory that it would enable me to save the two extra horses, and for a starter that was all I attempted, except that I used it for hurry calls, especially if they were at a long distance. It has not resulted in any saving to date. Being an experiment only, I was compelled to run the machine myself or send a man along, as I did not consider it advisable to turn it over to the regular drivers. I found that I could cover a route in about one-half to two-thirds the time previously consumed. I have not kept any accurate data of time or miles covered, except in one case out of curiosity, when I made a route covering 13 miles, delivering forty-two bundles, in 2 hours 5 minutes. As it was necessary to stop and collect for the bundles, of course, a large amount of the time was spent in this way, but I did not keep a record of the exact time thus spent.

"From my observation, I consider it a valuable auxiliary wagon, but, in a town of this size, do not believe it can be used to advantage in the place of a regular wagon at all times. I think it would well pay anyone having a touring car to fit it up as I have, and it is quite possible it might do to put on a regular car, but the original expense would be pretty heavy for the amount of service it would give, unless it would be found practical to entirely dispense with some of the horse wagons. The advertisement afforded by such service is worth a great deal in a small town, and such experiments are well worth considering by others located as I am."

JOHNSTON'S LAUNDRY DELIVERY WAGON, USED IN WICHITA

PITTSBURGER'S TO MAKE CARS

Great interest is being taken in Pittsburg automobile vehicle circles in the light electric delivery car which the Pittsburgh Motor Vehicle Co. is just starting to manufacture. The company last week received a permit for the erection of a factory in Summerlea street, East End, and next spring it expects to erect a plant that will employ fifty men and where several cars can be turned out every week. The car which it will push hardest weighs 1,000 and 1,500 pounds. It was designed by D. L. Brown, manager of the electric department of the Standard Automobile Co. Those who have watched it in operation claim for it that it reduces the percentage of dead load to a minimum and greatly increases the proportion of live load. The parts are purchased direct from the supply houses and assembled at the factory in Pittsburg.

SHOW GOOD MILEAGE

The Park Auto Co., of Pittsburg, which was organized in July with a capital of $20,000 to give Pittsburg's exposition visitors and others an opportunity of seeing the parks and manufactories of Greater Pittsburg, reports through its president, M. J. Dain, that its two cars have traveled over 1,500 miles this season. They will be kept in regular service until November 15.

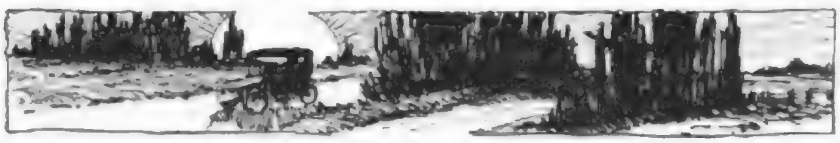
SHORT STORIES OF TOURING



H. G. Bemis, of Los Angeles, Cal., who, with his wife, is on a 3 months' tour in an automobile weighted down with luggage, even to a stove and trunk, has left San Francisco on his trip further north, the southern motorist expecting to journey as far as Portland. In speaking of the pleasures to be had on a trip of this kind, Mr. Bemis said: "We are having a fine time of it every day, and often stop for a few days at places where there is any pleasure to be had. There have been no particular excitements with us, not even so much as getting stuck on the road or a breakdown. It is just a case of going any place we want to, and we don't have to walk, either. We have had an abundance of small game and trout, and will soon be looking for big game. The worst piece of road we have yet struck was about 40 miles south of Stockton, near Turlock, and there we encountered about the worst 4-mile stretch of sand I have ever seen in all my motoring career."

At Madera, Mr. Bemis left the machine and went in a team to Merced by way of Raymond and Big Oak Flats, and then back to Madera by rail, being unwilling to pay the $50 toll asked to enter the pass. "We could have made this trip with the car without trouble," remarked Mr. Bemis, "but the roads are narrow, and there is danger of frightening teams, so a heavy toll is imposed. It has the effect to make motorists go in wagons or by rail if they wish to go at all. We spent considerable time in the valley. The trip through mountains and forests was very beautiful, especially through the Big Tree groves."

IDEA FOR TOURISTS

Tourists who travel in pairs and are satisfied with one seat will be interested in learning the way R. L. Jefferson, F. R. G. S., a famous transcontinental tourist who is now en route from London to Constantinople, has fitted up his 8-horsepower Rover. The most noticeable thing about the machine is the body, which resembles a deep, oblong box or rather a tonneau with no door and no back seats. This in reality makes a runabout out of a touring car, with the space usually occupied by the rear seats used for packing baggage. The front seats can be lifted bodily out of the car. Under them are carried the tools, lubricating oil and repair outfit. In the deep space behind the seats all the heavy spare parts are carefully stowed upon the floor. Each part is either screwed to the floor or made to fit into a neat wooden frame which is fixed to the floor. The small things are all done up in bags numbered, and a list is carried, so that any part can be located by reference to the list. On the top of these a detachable lid is laid, and upon this lid the personal luggage of the two occupants of the car is carried, and on each side there is a spare non-slipping Dunlop cover. Over the whole a fitted waterproof cover is secured, while last, but not least, there is a Cape cart hood, which comes right up, and completely envelops the luggage and the occupants of the car, and is continued well forward, so that they and the car and its contents generally are entirely sheltered from the weather. Everything has been carefully thought out, and no better instance of this is found than in the maps which Mr. Jefferson has prepared for his journey. These are carried in a small wooden box on the side of the car, and the maps selected are those of the Austrian military survey. Each day's drive is cut out and mounted on stiff card and numbered from 1 onwards, so that all the driver has to do is to take, say, No. 1, drive over the route it shows, and put it at the back of his map box. He then finds No. 2 to his hand for the second day's drive, and so on.

FAST TOUR ACROSS COUNTRY

One of the most remarkable automobile trips ever undertaken by one or more Lexingtonians was completed Monday by the arrival at the Kentucky city of William T. Muir, Sydney A. Hughes and Sherman Leigh, who left there 2 weeks previous on a record breaking trip to New York, carrying with it a good sized wager with the well known Lexington turfman, John W. May, that the run to the metropolis could not be made, barring accidents, in 4 days and nights. When the wager was made May little dreamed of Muir's ability as a driver in the Blue Grass state, and it was not until after the automobile party had reached New York the following Saturday morning that he was thoroughly convinced that Muir had really undertaken the trip. The trip to New York was remarkable in several respects. First the machine was run both day and night during almost the entire trip, as only once did the party seek the quiet of a hotel. That was when they encountered a rain storm, which delayed them for about 6 hours. During the remainder of the trip Muir sate at the wheel for 18 hours, while Leigh and Hughes propelled it for 6 hours in order to allow Muir to get a little rest. The only time the party left the machine on the trip to New York was at Cleveland, where they encountered rain and it was then that the most exciting period of the trip occurred. The tourists retired to their rooms in the hotel at midnight and left orders to be called at 4 o'clock in the morning if the rain had stopped, and when it was seen by the clerk of the hotel that it was possible for the party to proceed efforts were made to arouse the slumberers. While Messrs. Hughes and Leigh answered the first call and hurriedly dressed, it took the combined efforts of those two and several bell boys at the hotel to get Muir thoroughly awakened and dressed, he being so completely exhausted from the nerve-racking venture he had undertaken. Immediately upon arriving in New York Muir and his party at once made affidavits to the effect that they had made the entire journey in the machine in which they left Lexington, and this matter being attended to, they witnessed the Vanderbilt cup race that afternoon, and that night started back to Lexington. The return trip was taken by easy stages, the party stopping off at several points of interest enroute. Two days were spent at the plant of the Pope Mfg. Co. at Toledo, where several minor repairs were made on the car. The trip to New York was made via Cincinnati, Dayton, Columbus, Cleveland, Buffalo, Rochester, Syracuse, Albany and thence down the Hudson to New York.

DEAD BROKE TOUR ENDS

E. F. Simmons, wife and two children, of Syracuse, N. Y., started out from New York city the latter part of June to cross the continent in an automobile, starting without a cent in their pockets. They have returned home after making between 3,000 and 4,000 miles, being compelled to abandon the journey on account of the illness of Mrs. Simmons. Had she not been unable to stand the trip the continent would have been crossed and recrossed.

MOTORING IN CHICAGO PARKS

Pair to Draw To—Italy's royal pair, King Victor Emanuel and Queen Margherita, are enthusiastic motorists, both of them using Fiats. The queen is much given to touring, while the king finds much enjoyment in handling the wheel himself.

Ormond Officials—Secretary Dai H. Lewis of the Automobile club of Buffalo, who was assistant to W. J. Morgan at the Ormond Beach races last winter, has been informed that he has been selected as clerk of the course for the Ormond events this season. Fred J. Wagner will be starter.

Progressive College—Professor R. E. Trask, of Denison university, who has charge of the engineering department in that school, called last week at the office of the state commissioner of highways, at Columbus, O., and secured copies of all the bulletins that have so far been issued, and stated that he was about to have the scientific study of roadmaking taken up as a requirement for the completion of the engineering course.

Road Boom In Ohio—Governor Myron T. Herrick, of Ohio, has issued a proclamation, as requested by the National Good Roads Association, asking mayors, county commissioners, boards of trade, chambers of commerce and labor organizations to send delegates to the state convention at Columbus on the 18th and 19th. Especial interest is being manifested by the organization at Lima in the contest for president. It is expected that there will be 100 strong of this branch at the state meeting to boom Davis J. Cable, a prominent attorney, for the presidency.

Collect $3,000 In Fines—Justice Wood, of Ogontz, Pa., on the Old York Road, has already this season imposed fines of over $1,000 and nearly $300 in costs on automobilists who have violated the town's speed ordinances, and, besides, has nearly a score or more to hear from. Justice Walker, at Jenkintown, a mile or so above Ogontz, has disposed of nearly 100 cases since Decoration day; Justice Haines, of Cheltenham, has been almost as busy, while Justice Luff, at Weldon, on the Germantown Willow Grove pike, who started in on July 4, has also a good sized list. Altogether the Montgomery county treasury has been enriched from automobilists' fines to the extent of $3,000 or more. The bulk of this money is not lost to the automobiling public, for by a wise provision the residue, after paying costs to justices and constables, is devoted to the improvement of the county's roads.

In Chicago's Parks—Windy city motorists have had plenty of chances to enjoy the Indian summer and Chicago's parks and boulevards have been thronged with cars of late. Cameras have been used and one of them snapped a boulevard scene in which an Autocar runabout figured prominently.

Good Work—The Cleveland Y. M. C. A. will have an automobile course in its educational course, starting November 1. This is not new, as this has been in vogue for 2 years, but the new course just announced will be much more complete than heretofore. Last year the course consisted of lectures, this year the practical side of the work will be taken up. Factories will be visited and machines will be taken apart and explained. About 100 have already enrolled for the class.

Washington's First Run—The quaint and historical old town of Frederick, county seat of Frederick county, Maryland, emblazoned on the tablet of fame by the poet Whittier in his poem on the Barbara Freitchie flag incident, said to have transpired during General Stonewall Jackson's triumphant march through that ancient town during the days of the civil war, was the objective point of the initial run of the Automobile Club of Washington on October 19. While only ten cars participated in the run, because of the threatening weather, the enthusiasts who braved the elements were more than repaid for their defiance of old Jupiter Pluvius.

HOME OF AUTOMOBILE CLUB OF WASHINGTON

Hustler for Highway Commissioner—Sam Huston, state commissioner of highways in Ohio, will visit a number of counties in that state this week to secure samples of materials for roadmaking, and will have the materials tested at the laboratory of the Ohio state university, at Columbus.

Farmers Stop Scorcher—Farmers engaged in repairing the highway near Delaware, O., recently took effective steps to stop a scorching motorist who scared their horses and then kept on. The rustics first showered the fleeing car with rocks and then telephoned ahead to another gang of road-menders several miles down the road. When the scorcher arrived at this point he found further progress barred by a string of heavy dirt wagons lined up across the road. He then stopped and paid the damages demanded by the irate farmers.

Red Tape Routed—The misconduct of a chauffeur of one of the government automobiles used by one of the executive departments for delivery purposes was the direct means of bringing about an amendment of the civil service rules. The chauffeur in question repeatedly drove his car directly in the way of the president's carriage and seemed to take delight in cutting him out of the road. When President Roosevelt learned who the chauffeur was he said he ought to be discharged as incapable of operating the automobile. The subject was pressed by members of the cabinet, and the decision was reached to make the amendment to the civil service rules, in order that misconduct of a government employe might be made the cause of instant dismissal. It has thus remained for a chauffeur to cause a sweeping and comprehensive change in the civil service rules, whereby inefficient government employes can be weeded out and their places filled by competent employes. Heretofore such a thing was impossible owing to the construction placed upon the rules.

To Change Motor Cycle Rules—A rumor has gained currency in England to the effect that the committee of the Auto Cycle Club has decided not to enter for the international motor cycle cup race next year. This is declared to be quite inaccurate, as no decision has yet been arrived at. The club has, however, sounded the other countries on the possibility of confining the race to a more useful type of machine, and the Austrian club is apparently of the same opinion, for it has asked the Auto Cycle Club for its support to one of two proposals which will be laid before the next congress in Paris in December. The alternative proposals of the Austrian club are: That each machine should be weighed without tires, the rest of the machine without oil, water, gasoline, or batteries not to exceed 101 pounds and that only the motor and ignition apparatus be subject to a maximum weight. The first proposal would encourage the use of heavier tires and prevent the use of light tires in order to make up for an unduly heavy machine.

Digitized by Google

The second proposal would encourage by not penalizing the use of frame, wheels, saddle, tires and parts of all suitable weight.

Seek Park Rights—Philadelphia automobilists are endeavoring to induce the Fairmount park commissioners to open the romantic Wissahickon drive to them. Owing to the narrowness of the roadway this beautiful road has been forbidden ground for motor cars. The success of the movement seems assured.

Orioles Name Officers—At the annual election of the officers of the Automobile club of Maryland took place W. S. Belding was reelected president; R. J. Leupold, vice-president; George S. Dickey, secretary, and Ernest J. Knabe, Jr., treasurer. An effort will be made during the coming season to obtain more favorable legislation for automobilists.

Want Sign Boards—A committee of the Automobile Club of Pittsburg, headed by James Francis Burke, attorney for the club, has requested the commissioners of Allegheny county to erect sign boards at all points of intersection of the various county roads. These roads are the pike roads which are directly under the control of the county commissioners and of which dozens of miles have been made the past year. It was pointed out by the committee that signs are needed more on these roads than on the city streets, inasmuch as so many persons now travel long distances in automobiles who are unfamiliar with the roads. It is likely that the commissioners will take action on the report in the very near future.

ITALY'S ROYALTY—KING VICTOR EMANUEL AND QUEEN MARGHERITA—TOURING IN FIATS

French Inquiry—The committee appointed by the French government to consider what changes, if any, are desirable in present regulations as to motoring will discuss the following points: Should an age limit be insisted upon for authorized drivers? Should a motorist or driver who applies for a permit to drive be called upon to produce evidence of good character? A new system of numbering motor cars. Whether or not every car should carry a speed indicator. The members of the committee are all officials.

Ohio's Governor Stopped—Governor Herrick of Ohio was one of the recent victims of the bicycle police delegated to bring in every one who exceeds 15 miles an hour. The governor was held up in an outlying district and it was only after protestations that the speedometer showed 15 miles an hour and no more, that he was released by the police, despite his official position.

BRIEF BUSINESS ANNOUNCEMENTS

Cleveland, O.—Work on the new factory building for the Peerless Motor Car Co. is progressing rapidly.

Elkhart, Ind.—John S. Landon, although only in his present place 2 months, is contemplating building a new garage in the spring.

New York City—Gross & Gross Co. leased for John A. Tallman to an automobile company the ground floor of 308-310 West Fifty-ninth street, for a term of years.

Goshen, Ind.—The Goshen Auto and Supply Co. is located in a building 25 by 100 feet, and is going to put on an addition of 50 feet, in which will be placed a complete repair shop.

New York City—Louis Mansuy, well known in the carriage and rubber tire trade, has joined forces with the Fiske Rubber Co. and will assist Manager J. W. Bowman at the New York branch.

Detroit, Mich.—The Detroit Auto Specialty Co., recently incorporated with a capital stock of $3,500, has taken over the business of John A. Wilson and Joseph L. Manniere at 12-14 Sherman street. The company manufactures metal automobile specialties.

Bridgeport, Conn.—A new factory garage is to be erected for the Locomobile company at Seaside Park. The garage is to be used for the storage of cars previous to delivery, and the regular garage will be used for cars owned locally, and for completed cars.

Baltimore, Md.—M. Gillett Gill has taken out a permit to build a $40,000 garage at Maryland and Mount Royal avenues.

St. Louis, Mo.—Amadee V. Reyburn, Jr., has purchased a lot on Delmar avenue west of King's highway, on which he intends building a $35,000 garage.

Austin, Tex.—S. B. Radkey has leased the John Phillips store on West Fifth street, and in addition to his carriage factory, will engage in the automobile repair business.

West Orange, N. J.—Options have been obtained on 65 acres of land on top of the Orange mountains by T. Phillips White, of New York, who proposes to erect a garage and hotel. There will also be twenty cottages, a stable and a riding track.

Pittsburg, Pa.—Architect J. E. Obitz has plans for a garage to be erected on 50 by 115 feet on Broad street, near Euclid avenue, East End. The building will be owned and occupied by the Central Automobile Co., composed of E. G. Mooney, the real estate operator, and Edward Seely, his son-in-law.

Bucyrus, O. George and Volney Rosina will open a new garage the first of the month in a new fireproof building which is about completed. The building is 80 feet long and 35 feet wide and is constructed of cement blocks. For a year George Volney traveled for the Reo and Cadillac people.

Bellefontaine, O.—It is reported that the Zent Automobile Co., of Bellefontaine, O., will be removed to either DeGraff or Lancaster.

Sandusky, O.—George Daniels and Paul Swessinger have purchased ground on which will be erected a new building for an automobile garage.

Providence, R. I.—The Rhode Island Motor Car Co., 69-71 Broad street, will handle the Thomas Flyer in Rhode Island for 1906, C. S. Henshaw having closed for the car last week.

Buffalo, N. Y.—The Kane-Chamberlain Co., recently incorporated, will build carriages and automobiles. It is building a plant 57 by 100 feet, two stories high, at Tupper and Ellicott streets, at a cost of $25,000. It is in the market for a good line of cars.

Albany, N. Y.—C. Sutherland Ransom is at the head of a new garage company which will build at the corner of Pine and Chapel streets. The plant will cost $50,000. No name has been selected for the company as yet, but it will probably be the Albany Garage Co.

St. Louis, Mo.—The Mercantile Trust Co. has closed the sale of a tract of land on Delmar avenue. The lot has been purchased by Amadee V. Reyburn, jr., who will erect an automobile garage on the site. The building is to cost $35,000, and will have every conveniences and appliance for the sale and maintenance of automobiles.

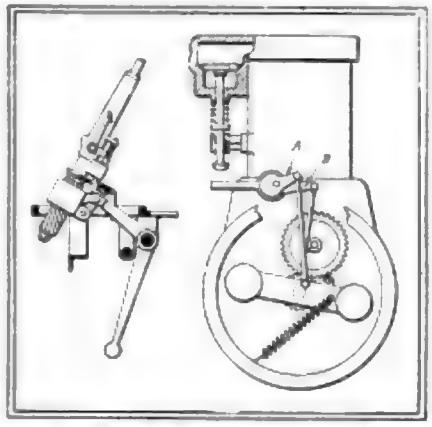
Current Automobile Patents

LETTERS PATENT No. 801,291, dated October 17; to Gottlieb Honold, of Stuttgart, Germany—The ignition device consists of a revoluble armature with two separate windings. One winding connects from a battery and has a condenser in circuit. The other winding has an induced current from the first winding and is in circuit with the two electrodes of the spark plug. Means are provided for operating synchronously the opening and closing of the short circuit and the movement of the armature. The timing of the spark is obtained in the usual way.

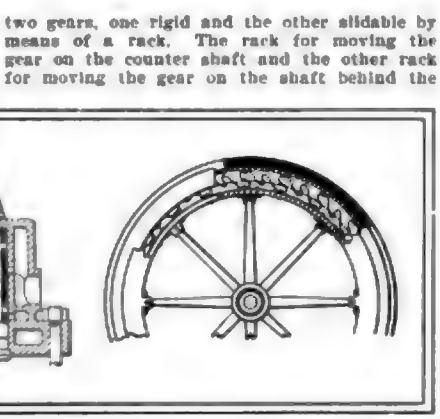
Letters patent No. 802,038, dated October 17; to Franklin W. Hagar, of Nashville, Tenn.—The inventor's carbureter has the float A in a separate chamber and the gasoline passage leading therefrom to the spraying nozzle passes up a heavy central tube in the center of the mixing chamber. The entrance of air into the mixing chamber through C is under control of the valve E, ordinarily held on its seat by a spring which surrounds the gasoline passage to the nozzle. The top of the mixing chamber is a cap screwing in place and has hanging downward from it a circular part F, reaching below the spraying nozzle, which is within it. This hanging part is perforated and the space surrounding it communicates with the motor. Air entering by motor suction raises the valve E and enters the chamber surrounding the nozzle, mixes with the gasoline, then passing out through the perforations in F, passes to the motor through the opening B.



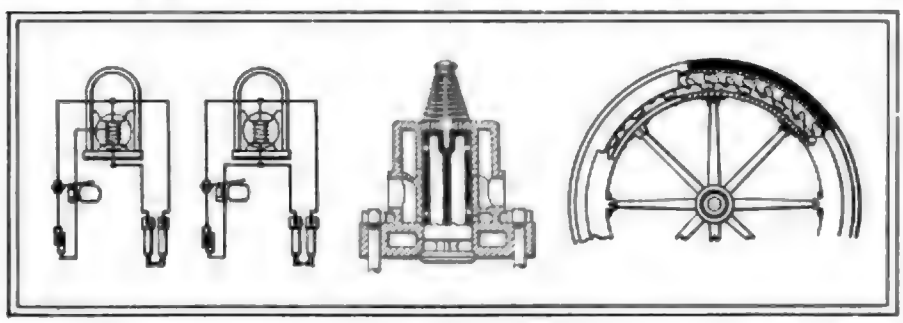
LAW'S STEERING GEAR

Letters patent No. 802,125, dated October 17; to Ernest R. E. Uhlin McDonald, of MacDonald, Pa.—The invention is a form of valve casing for use on gasoline motors in which the valve and one casing will do for the exhaust and intake of one motor. The casing has a cylindrical chamber communicating with the interior of the cylinder, and the valve controlling the entrance between the casing and the cylinder. In the casing above the valve are two ports, one for the intake mixture and the other for the exhaust, and the valve casing is made to register with these ports one at a time so that in one movement a mixture is taken in and the exhaust port is covered and again the intake passage is covered and the exhaust opened. One casing answers for a cylinder, or might be made to do for the four valves in a pair of cylinders formed by a single casting.

Letters patent No. 802,282, dated October 17; to Fred A. Gerling, of Portland, Ore.—The inventor, in his automobile, has the motor placed near the back axle so that he can drive without the use of side chains or a propeller shaft. The crank shaft carries small pinions on either end, which mesh constantly with large gears on the end of a cross shaft behind and parellel with the crank shaft. On this latter shaft are two gears, one rigid with the shaft and the other slidable longitudinally by means of a rack. Between the crank shaft and the one behind it is a counter shaft carrying two gears, one rigid and the other slidable by means of a rack. The rack for moving the gear on the counter shaft and the other rack for moving the gear on the shaft behind the counter shaft are connected by a gearing so that when one rack is moved to the right the other goes to the left and vice versa. The sliding pinion on the counter shaft is very long and can be made to mesh with either of the gears on the shaft in the rear of the counter shaft and at the same time is in mesh with a large gear on the rear axle, or if desirable on a differential counter shaft from which a double chain drive can be used. The transmission gives two forward speeds and a reverse, gained through a single lever.



RITE'S MOTOR



HONOLD'S IGNITER

McDONALD'S VALVE

COUSEN'S WHEEL

Letters patent No. 802,356, dated October 17; to Fred A. Law, of Hartford, Conn.—The inventor's steering gear consists in a hinged steering pillar. On the lower end of the pillar is a quick pitch thread and surrounding the pillar on the threaded part is a traverse nut adapted to be moved up and down the steering pillar over the threaded part when the pillar is turned to the right or left. Just behind the support of the pillar is a cross shaft on which is pivoted a bell crank piece, the depending, or downward projecting part being the arm to which the cross rod connecting the steering knuckles is attached and the other arm is fastened to the traverse nut on the steering pillar. The connection between the latter arm and the nut is sufficiently flexible as to permit the nut to travel from the top to the bottom of the thread without exerting undue strain on the bearing.

Letters patent No. 801,852, dated October 17; to Alfred Cousen, of Detroit, Mich.—The invention is a type of spring wheel, the aim of the construction being to secure the resiliency of the pneumatic tire by using springs and solid rubber tires. The wheel has a double set of rims, an inner one to which the spokes are attached and outer one on which the solid rubber or steel tire is carried. Between these two rims are two separate sets of springs. In one set the springs are S-shaped and are intended to resist all strain in radial direction, while between the S-shaped springs are other double curved springs that transfer the driving power from the inner rim to the outer one on the driving wheel. They also come into use when brakes are applied. The two sets of springs are so arranged that the double curve ones, made out of flat metal, connect with the inner end of one S-shaped spring with the outer end of the next S-shaped one. The inner and outer ends of both sets of springs are respectively connected to the inner and outer rims.

Letters patent No. 802,321, dated October 17; to Francis M. Rites, of Ithaca, N. Y.—The inventor's gasoline motor has a special device for opening the valve. The latter is placed in the bottom of a port on the side of the cylinder and is normally held shut by a coil spring surrounding the stem. The valve is opened from the crank shaft. Above this shaft is a half time gear, driven by a small gear on the crank shaft. On the gear on the crank shaft is a connecting rod connected with a fulcrum A working on an eccentric. Surrounding this eccentric fulcrum is the bearing of the arm B that opens the valve by a connecting rod from the half time gear.

Letters patent No. 801,150, dated October 3; to James A. Murphy and William S. Manning, of Springfield, Mass.—The inventors have a pneumatic tire with the casing provided with regular clincher lips. Between the air chamber and the outer part of the casing, or over the tread of the air chamber, is placed a reinforcement of rubber of greater circumference than the interior of the casing, the intention being that when the casing is distended radially this reinforcement will then have its entire force ready to resist blow outs.

ROADSIDE TROUBLES

An Ounce of Prevention

Copyrighted by the American Motor League

By Chas. E. Duryea

THE ENGINE—The engine forms so large a part of the system that it is difficult to include under one heading its many possible troubles and these have therefore been considered under separate heads as fully as possible. A frozen water jacket usually bursts on the outside without affecting the cylinder proper, but leaky cylinders sometimes occur from this or other causes, which impairs or prevents proper working. In many cases a defect of this kind will make itself known at starting in the morning, and drops of water are found on the spark plug or in the exhaust valve and pipes or in the crankcase. If the cylinder is cleared of water it may start and run all right, except with slightly diminished power and with difficulty of starting each time. Some experiences seem to indicate that the presence of water causes overheating, and where this is true it is probably due to a slow and imperfect combustion, with the charge exhausted half burned instead of burning and developing full power. Cylinders sometimes crack from other causes than freezing and hot water used to warm the cylinders on a cold morning has been known to cause trouble. Faulty lubrication, bent or broken shafting or other parts, and particularly valves and sparking mechanism out of time are to be looked for when the engine misbehaves. Lubrication also should be thoroughly considered. The resistance of a dry piston covered with burned and gummy oil is far greater than one would imagine and frequently sufficient to stop the motor. A cracked water jacket can usually be repaired temporarily by soldering with soft solder.

CIRCULATION—In connection with engine troubles, the water circulation or the air cooling, if air is used, are quite important. The pipes may be stopped up by a bit of waste or by deposit of lime and dirt or the pump or fan may not be running at speed and as a result of these things, the walls become overheated, which not only burns off the lubricating oil, but causes premature firing, either of which destroys power. From the overheated cylinder, the heat is conducted to the crank case and bearings, sometimes causing trouble there. In most of these troubles the difficulty is to find rather than to fix, and the user should familiarize himself with the entire system as rapidly as possible, so that he may both know what it is for and when it is in order. The man who is master of his mechanism not only makes it serve him, but he derives a pleasure from its use that is impossible to enjoy as a mere passenger trusting to chance that the machinery will behave properly.

GASKETS—It is quite common practice to use gaskets where two pieces of metal are fitted together for the purpose of securing a tight joint between the two surfaces which are not sufficiently perfect to join tightly otherwise. These gaskets are of different material, depending upon the places where they are used. Around the engine, asbestos is the common thing because it will not burn even if the engine is overheated but common paper, like tough wrapping paper, is sometimes used. A gasket should be as thin as possible, just thick enough to fill up the inequalities of the metal. It is quite evident that the gasket material is not so strong as metal on which account a thick gasket is more likely to blow out than a thin one. Special packing material is now made of asbestos having fine wire woven into it. This wire adds strength and prevents danger of blowing out quite largely. If it is likely that the joint will be opened, the gaskets should be prepared accordingly. A good practice is to coat one side with shellac or oil and the other side with graphite, which will cause the gasket to remain in place on one side while freeing itself from the other readily. Gaskets for water should be saturated with oil or heavy grease, while for gasoline, shellac or glycerine is advisable. Common soap also serves well, particularly on screw threads exposed to gasoline. Where the temperature is not high sheet lead serves well and for joints more permanent than can be made with asbestos, sheet copper is used.

GOVERNOR—Automobile motors being almost constantly in the care of the driver seldom use governors except in some cases for controlling the spark. The governor must be sensitive to do its work properly, and irregular action is usually due to the presence of dirt which clogs the moving parts or to weak and broken springs or to the presence of ice or water.

ICE—The usual thought of ice is in connection with the cooling system, and care must be taken that radiator and small pipes containing water are not exposed for any length of time to winter conditions. The circulating system should either have the small parts cut out, depending upon the mass of water in the engine and in the tank to avoid freezing under ordinary conditions or else it should not be filled at the approach of cold weather with a liquid not susceptible to the temperature to which it is likely to be exposed. Hot water, of course, is the common remedy for thawing frozen pipes and if at hand should be used in preference to other methods. Next to this a torch, keeping ever in mind the danger from fire where gasoline is present. Gasoline is most inflammable and this feature may be a power for evil as well as for good. With a squirt can the liquid gasoline may be dropt on the radiator where frozen and ignited but exercise care to apply but little at a time that the flame may never be large and make sure that there are no gasoline leaks about the main tank or anywhere on the premises. Gasoline may be safely squirted from the usual oil-can holding less than half a pint while flame is burning at the nozzle, and such a can may be used to thaw out a pump, cock or frozen radiator with flame under full control and with perfect safety. Turning the nozzle upward stops the flow of liquid and the flame goes out. This practice if followed must be with the greatest of care.

Water in the gasoline is troublesome enough, but ice is more so. The motor may run fairly well until the water is frozen because in splashing around sufficient gasoline passes to do the work but ice closes the openings, holds the float immovable and must either be removed or melted. Hot water or warm rags are the usual remedies, for fire around the vaporizer is not usually to be thought of. If the tank and vaporizer cannot be drained, provision for draining should be promptly applied and occasional testing for water in cold weather is advisable. In the machinery itself ice sometimes makes trouble. Driving in slush or rain or snow fills many joints with water, which freezing, renders the parts immovable and care should be taken in the morning not to force parts that seem solidly fixed, lest something be broken; for under such circumstances, ice grips most powerfully and stripped gears may result. Proper oiling is a preventative usually for such troubles. Heat must be applied to the frozen parts.

Ice in the feed pipe is frequently found on damp cold days. The evaporation of the gasoline causes the moisture of the atmosphere to deposit like a heavy frost, completely stopping the pipe and rendering the motor weak and very irregular. A little hot water will temporarily remove this, but the remedy is to heat the air pipe or the air and thus prevent or overcome this tendency. Usually a heater is provided by the maker. Examine this to see if it is clogged.

LUBRICATION—This subject is most important. Moving parts require oil and the operator should not only think but should know that they are properly supplied. Here simplicity comes in. A few parts can be watched more readily than many. Inspection of the parts is the only certain way to know their condition. Automatic devices are good but they always have had and always will have, one fault. They may fail when worst needed, and since the operator has learned to depend on them, they permit trouble to occur when least looked for. Pumps and valves are troublesome, long pipes clog easily but lubrication must be had and eternal vigilance it the price of it.

EDITOR'S NOTE—This is the fourteenth of a series of articles by Charles E. Duryea. These articles will be prepared for publication in book form and will be distributed by the American Motor League to its members during the coming year.

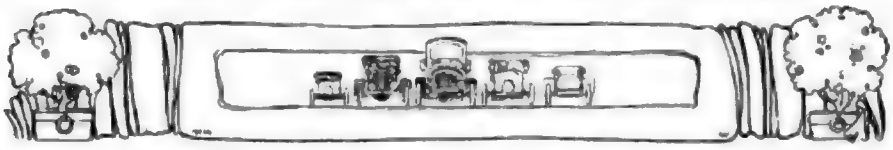
AMONG THE MAKERS AND DEALERS



Marvel Assistant—Harry E. Marvel has been appointed assistant manager of the Pope branch in Boston.

Taxis Quits—W. W. Taxis has resigned the managerial reins of the Philadelphia branch of the Ford Motor Co. and will be succeeded by L. E. Hoffman.

Michelin Man in Hub—E. A. Percy, formerly representative of the Michelin tires, is to establish a sundry house in Boston, having secured quarters in the new Motor Mart.

Orients Boston Agent—Lincoln D. Roberts of Lynn, Mass., has closed for the Boston branch of the Orient and will assume that position immediately upon the completion of the new Motor Mart.

On Decauville Business—E. S. Partridge, vice-president of the Decauville Automobile Co., is scheduled to sail for Europe today on the Amerika to arrange for next season's shipment of Decauville cars to this country.

Landed by Oakdale—Negotiations for the transfer of the plant of the Model Gas Engine and Automobile Works from Auburn, Ind., to Oakdale, Ind., have been completed and work on the plant will start at once. The company will employ 125 men on the new plant.

Fosdick Gets the Fiat—The Harry Fosdick Co. has secured the New England agency for the Fiat cars, Hollander & Tangeman making the appointment immediately after the Vanderbilt race. This car, together with the Studebaker, will be the big cars of the Fosdick combination.

Adams Going Back—Walter E. Adams of the home office of the Oldsmobile Company, is to go to Boston and take charge of the retail branch. Mr. Adams is by no means a stranger to that city. He was formerly sales manager of the Crest, and knows the New England trade like a book.

Peerless in Boston—The new Peerless was seen in Boston last week, it having been driven over the roads from Cleveland by Charles Schmidt, its designer, accompanied by Mrs. Schmidt, Lou Sackett and Charles Burnham. The party reported a trip of 2,500 miles. The tourists are now on the way home.

Home Garages—In a circular issued by the Pope Motor Car Co., of Indianapolis, illustrating simple arrangements by which Pope-Waverleys can be stored and charged at home is told the system followed in Rockford, Ill., where the fifty-four electrics in use there are inspected each week by the dealer at the expense of the owner. The average cost of current in Rockford is $3.54 per month. Some of the home garages shown are most simple, one man having built an addition to his house, the upper part of which is used for a sun parlor and the lower part for a garage. Another is built under one end of the front porch so that it is hardly noticeable.

After the Berliot—J. G. Bale, of Mendall, Dale & Co., New York, has gone to Europe to arrange for 1906 importations of Berliot cars.

Godwin Locates—Raymer Godwin, agent for the Thomas for Brooklyn and Long Island, has opened headquarters at 53 Grant Square, Brooklyn, adjoining the Union League Club.

Lines Wanted—Charles F. Beltz, manufacturers' agent for Pittsburg and western Pennsylvania, announces he is anxious to correspond with makers desiring representation in his territory. He has opened a large salesroom and handles automobile supplies of all sorts.

Whites' Quaker Branch—After a long search for a suitable location in Philadelphia, the White Sewing Machine Co. has secured the old Banker quarters, 629-631-633 North Broad street, above Wallace, for a local branch. E. C. Johnson, formerly of the Quaker City Automobile Co., has been installed as manager.

Moves Peerless Plant—The Peerless Motor Car Co., of Cleveland, has moved its general offices, together with all machinery, stock and tools, from its old time plant on Lisbon street to the new factory on Quincy and Oakdale streets. During the past year the company has been operating the old plant and one building, the first erected in the new plant. Two other buildings are now being completed and hereafter all work will be centralized at the new plant.

Tradesman Accused—An unlooked-for development in the trial of Stanley Francis, of the Storey Cotton Co., which was concluded in Philadelphia last week, was the arrest of J. Edward De Mar, manager of the National Automobile Co., of New York, on charges of attempting to bribe and influence witnesses of the prosecution. The Storey Cotton Co. was, it is charged, a get-rich-quick concern, and the National Automobile Co., it is alleged, is a subsidiary concern into which some of the money of the Storey victims had been invested. It is also alleged that the officers of the two concerns were identical. On Tuesday, the last day of the trial, after the jury had retired, the government sprung its trap, De Mar being arrested just as he was about to leave the courtroom. At the hearing on Friday, before United States Commissioner Craig, several of the government's witnesses in the Storey case testified that De Mar had approached them before that trial and offered them positions with various concerns, among them the National Automobile Co., if they would so color their testimony as to make it favorable to Francis. The stories the witnesses told were so convincing that Commissioner Craig decided that a prima facie case had been established against De Mar and the latter was held in $1,500 bail for the next term of court.

Zent's President—W. W. Osborn has been elected president of the Zent Automobile Co., at Bellefontaine, O., to succeed O. E. Yoder, who has resigned.

Uses Carriage Plant—Word comes from Amesbury that the Bailey Carriage Co. is to become the manufacturing plant of the Essex Motor Car Co. The Bailey plant, one of the largest carriage manufacturing plants in New England, has, it is understood, been turned over to the Essex Co., a new firm, organized for the purpose of producing a steamer.

Hub Recruit—The Morrison-Tyler Motor Co. will open its establishment in Boston within the next 2 weeks, and will handle the Rainier and the Maxwell-Briscoe products. Mr. Morrison of this firm was the former manager of the Peerless branch in Boston.

Row Too Crowded—Having been unable to secure a suitable location on automobile row in Philadelphia, the Wayne Automobile Co., of Detroit, Mich., has established quarters on Sixteenth street above Chestnut. W. M. Umbenhauer, the local representative, hopes, however, to have the Wayne suitably installed in a row establishment before next spring.

Good Done by Advertising—A. E. Maltby, manager of the Philadelphia Winton branch, reports unprecedented new business for this time of year. He ascribes the boom to the unique traveling exhibition of the Winton concern, which recently spent 3 days in the Quaker City and was visited by thousands of enthusiastic automobilists.

Cadillac Line—The Cadillac Automobile Co. announces that its line of multiple vertical cylinder cars will consist of the following: 22-horsepower four-cylinder five-passenger light touring car, 30-horsepower four-cylinder touring car and 40-horsepower four-cylinder de luxe touring car. All of them will have three speeds forward and direct drive by jointed propeller shaft.

Mercedes Shakeup—There has been a complete reorganization of the Mercedes Import Co., of New York. E. C. DeWitt, a Chicago advertising agent, is president; Walter C. Allen, formerly of Allen, Halle & Co., is vice-president and general manager; and Arthur Braun is secretary. Mr. Winebrgh, of Omega oil fame, has retired from the presidency. The company has established headquarters in the Tirius building. Smith & Mabley continues as Mercedes selling agent under the new arrangement.

Italy's Big Show—A great international exhibition, to commemorate the opening of the Simplon tunnel, will be held next year at Milan, Italy, at which show the progress made in means of transport will have first consideration. Automobiles will have one of the principal buildings. The German manufacturers consider this show of such importance that they have called in the assistance of the automobile club, which has given its promise to make all arrangements for concerted action. The German firms will not exhibit individually, but arrange to have one grand stand.

Digitized by Google

to be called the German automobile show, where everything will be found that the Fatherland produces in the motor line.

Winton Going Abroad—Alexander Winton is to sail this week for Europe. He will visit the leading factories and attend the Paris show.

Radiator Test—L'Auto, the French daily, is planning to hold a radiator test this winter. It will be in the form of a competition, with prizes offered for the successful maker.

Sell for Spring Delivery—Advance retail orders already received for spring delivery lend the Rainier Co., of New York, to predict that if this pace is kept up its 1906 product will be sold before show time.

Increase Territory—Homan & Schultz of New York, have had their territory for the National automobiles increased. In addition to Greater New York and Long Island, it now embraces Hudson and Bergen counties in New Jersey; Orange, Rockland and Westchester counties, in New York, and Fairfield county, in Connecticut.

Gallaher to Move—E. B. Gallaher, importer of the Richard-Brasier and Newport agent for the Cleveland, will occupy on November 1 his new garage at 228 and 230 West Fifty-ninth street, New York. It is a five-story structure formerly occupied by the De Cerron stables and adjoins the E. B. Rice Baker electric garage, a lease has been taken for 10 years.

Cadillac Garage—The Cadillac Company of New York, metropolitan agent for the Cadillac, expects to move about February 1 into its fireproof building situated on the corner of Sixty-second street and Broadway. It will have a frontage of 52 feet on Broadway and 72 feet on Sixty-second street. It will cover 20,000 square feet of land and will consist of four stores and a basement all devoted entirely to the Cadillac business.

Horseshoers Shiver—J. C. Buckley, a delegate to the Master Horseshoers' Convention in Kansas City, Mo., admits that the automobile has affected his industry by making apprentices scarce. "Fear of the automobile driving the horse into the list of extinct species has so decreased the number of apprentices to the horseshoeing business that we were hard put to it for a while in some of the eastern states to get assistants," said Buckley, "and we are now considering suggestions for establishing a horseshoeing technical school at Detroit, Mich."

A. L. Co. Finds Location—The American Locomotive Co., which is entering extensively into the manufacture of automobiles, will have for its New York headquarters one of the finest and best located garages in town. It has leased from the Auto Import Co. the building it is erecting at the northeast corner of Broadway and Fifty-seventh street, which was originally intended to be the future home of the Rochet-Schneiders in this country. An offer of $35,000 per annum rental, however, proved too strong a temptation for Messrs. Josephs and Eichberg to resist, and a lease was made. The Auto Import Co. will retain its present salesroom on Broadway, to which has been added the upper story of the adjoining building to increase the storage and repair shop facilities.

Foss Now a Quaker—The George N. Pierce Co., of Buffalo, and the Cadillac Automobile Co., of Detroit, will be represented in Philadelphia next season by W. J. Foss, formerly of Boston, who has secured the agency for these vehicles in the Quaker City and contiguous territory.

Thomas' Metropolitan Garage—Immediate work is to be started in New York upon the Thomas garage which is to be located at the southeast corner of Sixty-third street and Broadway—114 feet on Broadway and 145 feet on Sixty-third street. One-half of a city block will be covered by the building, which will be four stories and basement in height. E. R. Thomas, of Buffalo, purchased the land last Thursday and at once delegated the building firm of Haupt & Phinney to construct thereon a garage modern in every way and embodying a great many novel features. In the new Thomas garage 500 cars will be stored. The sales room will occupy the corner store and there will be in addition three other stores on Broadway which will be rented to other automobile dealers who will have the advantage of the storage space in the rear and above. Much of the space on the main floor back will be used for the storage of demonstration cars for the occupants of the building. Mr. Haupt, who will manage the place, will occupy the premises April 1. The deal represents, it is said, an expenditure of a half million dollars. The property was purchased outright. Mr. Haupt will continue to handle the Thomas car for 5 years to come.

LATE INCORPORATIONS

Troy, N. Y.—The Troy Garage Co., of Troy, has been incorporated with a capital stock of $500.

Detroit, Mich.—The Feebook Auto Co., of Detroit, has been incorporated with a capital stock of $25,000.

Albany, N. Y.—The Auto Exchange of Albany has been chartered by the secretary of state with a capital of $500.

Guthrie, Okla.—The Automobile Tire & Repair Co., of Guthrie and Chicago, has been incorporated with a capital stock of $10,000.

Guthrie, Okla.—The Southwestern Transit Co. has been incorporated with a capital stock of $25,000, to operate an automobile line.

Quincy, Mass.—The Griswold Mfg. Co. has been incorporated with $25,000 capital, to manufacture automobiles. Robert Griswold is president and treasurer.

Hammondsport, N. Y.—The George H. Curtis Mfg. Co. has been incorporated with a capital stock of $40,000 to engage in the manufacture of motor vehicles.

Aurora, Ill.—The Practical Automobile Co., of Aurora, has been incorporated with a capital stock of $100,000. The company will engage in the manufacture of automobiles.

Ossining, N. Y.—The Hutchinson Electric Horn Co. has been incorporated with a capital stock of $20,000. It will manufacture horns for automobiles and horseless vehicles.

New Orleans, La.—The Independent Auto Co., Limited, has been incorporated with a capital stock of $25,000. The company will deal in all kinds of automobiles and automobile supplies.

New York City—The Automobile Sales Co. has been incorporated, to deal in automobiles; capital, $10,000. President, Lorenzo D. Bates, 138 Summer street, Brockton, Mass.; treasurer, Fred S. Macalaster, 486 Brookline avenue, Boston; clerk, Annie J. Tingley, 246 Norfolk street, Cambridge, Mass.

New York City—The Automobile Buyers' Association has been incorporated, to manufacture and deal in automobiles, motor boats, etc.; capital, $10,000. Incorporators: Samuel C. Meyer, 98 Chambers street; Eugene C. Harding and Clarence E. Mandy, both of 135 Front street, all of New York.

Ford in Boston—It is authoritatively stated that the new manager of the Boston branch of the Ford company will be named on November 1, and that he will be a Bostonian well-known in the motor trade.

It's a Boy—"Richard Ives Welles, born October 7, 1905," reads the card sent out by Mr. and Mrs. Richard Head Welles, of Kenosha, Wis. Translated, it means Dick Welles, of Solar light fame, is now a father.

Office in Old Mansion—The E. R. Thomas Co., of Buffalo, has moved its general offices from the quarters in factory No. 1 on Niagara street to an old mansion located just behind the new factory addition. Work on the factory addition is being rushed and machinery will be moved in soon.

Matheson Officers—The election of officers of the Matheson Motor Co., of Wilkesbarre, Pa., resulted as follows: President, Charles W. Matheson; vice-president, Henry U. Palmer; secretary, F. F. Matheson. It is expected that the new plant will be in operation by January 1 and that the machines will be on the market in the spring.

Wayne's '06 Goods—Officials of the Wayne Automobile Co., during their visit to Newport for the Vanderbilt cup race, made the statement that the company's 1906 line would include four-cylinder cars of 30 and 60 horse power, a 16-horse power runabout and a 20-horse power touring car, the last two with double opposed cylinders.

Fostoria Enterprise—The Detroit-Oxford Mfg. Co., of Oxford, Mich., has made Fostorians a proposition to locate in Fostoria, O., and give the concern the name of the Fostoria Auto Car Co., if the citizens of that town will take $50,000 of the $150,000 preferred stock. Nearly all the stock has been subscribed, it is reported. The capital stock of the company will be $300,000, but $150,000 will be common. Each preferred share is $250. The Michigan people propose to take fifty families to Fostoria, the men to be employed in the plant, which will employ by the end of the first year from 100 to 150 men.

Branch in Trouble—Petition in bankruptcy has been filed against the de Dietrich American branch, a New York corporation at 215 West Forty-eighth street, by Thomas & Openheimer. It is alleged that the corporation is insolvent and has transferred some of its property. Mr. Thomas said that the liabilities are about $8,000, but could give no figures as to the assets, as there would probably be a legal fight to secure possession of them. The corporation was incorporated under the laws of the state of New York on May 5, 1905, by Frederick de Turckheim. A petition in bankruptcy was filed against him on October 12. Baron de Turckheim is one of the principal creditors.

THIS LEAGUE
Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it invites the co-operation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

STATE DIVISIONS

As announced last week, the division of the important states into separate districts has been taken up and the districts embraced in the New England states and in the New York division have already been published. From each of these districts a number of prominent automobilists will be selected to represent the state division in its board of officers, and the board thus formed will take up the work of the league within the state and adopt all rules and by-laws necessary for the selection of future officers and the carrying on of division work. The division of other states into districts is announced as follows:

NEW JERSEY DIVISION

District 1, counties of Hudson and Bergen; district 2, counties of Passaic, Morris and Sussex; district 3, counties of Union and Essex; district 4, counties of Warren, Hunterdon and Somerset; district 5, counties of Middlesex, Monmouth and Ocean; district 6, counties of Mercer and Burlington; district 7, counties of Atlantic, Camden, Cape May, Cumberland, Gloucester and Salem.

PENNSYLVANIA DIVISION

District 1, Philadelphia; district 2, counties of Delaware and Chester; district 3, counties of Montgomery and Bucks; district 4, counties of Lancaster, Berks, Lehigh and Northampton; district 5, counties of York, Adams, Cumberland, Perry, Lebanon and Dauphin; district 6, counties of Juniata, Snyder, Northumberland, Montour and Schuylkill; district 7, counties of Carbon, Luzerne, Columbia, Monroe and Lackawanna; district 8, counties of Pike, Wayne, Susquehanna, Wyoming, Bradford and Sullivan; district 9, counties of Tioga, Lycoming, Union, Mifflin, Clinton, Center and Huntingdon; district 10, counties of Franklin, Fulton, Bedford, Blair, Cambria, Somerset and Fayette; district 11, counties of Potter, McKean, Cameron, Elk, Clearfield and Jefferson; district 12, counties of Westmoreland, Indiana, Armstrong, Clarion and Venango; district 13, counties of Warren, Forest, Erie, Crawford and Mercer; district 14, counties of Butler, Lawrence, Beaver, Washington and Greene; district 15, county of Allegheny.

DELAWARE DIVISION

District 1, county of New Castle; district 2, counties of Kent and Sussex.

MARYLAND DIVISION

District 1, county of Baltimore; district 2, counties of Hartford, Cecil, Kent, Queen, Anne, Caroline and Talbot; district 3, counties of Dorchester, Wicomico, Worcester, Somerset, St. Mary and Calvert; district 4, counties of Charles, Prince George, Arundel and Anne; district 5, counties of Carroll, Howard, Montgomery and Frederick; district 6, counties of Washington, Allegheny and Garrett.

OHIO DIVISION

District 1, counties of Ashtabula, Trumbull, Lake, Geauga and Portage; district 2, county of Cuyahoga; district 3, counties of Mahoning, Columbiana, Jefferson, Harrison, Carroll and Stark; district 4, counties of Tuscarawas, Guernsey, Belmont, Noble, Monroe and Washington; district 5, counties of Summit, Medina, Wayne, Lorain and Ashland; district 6, counties of Erie, Huron, Crawford, Seneca, Sandusky and Ottawa; district 7, counties of Holmes, Coshocton, Muskingum, Morgan, Perry, Licking and Knox; district 8, counties of Athens, Meigs, Gallia, Lawrence, Jackson, Vinton and Hocking; district 9, counties of Fairfield, Pickaway, Ross, Pike, Scioto, Adams, Highland and Fayette; district 10, counties of Brown, Clermont, Warren, Clinton, Greene and Madison; district 11, counties of Lucas, Wood, Hancock, Hardin and Wyandot; district 12, counties of Fulton, Williams, Defiance, Henry, Paulding and Putnam; district 13, counties of Van Wert, Allen, Mercer, Auglaize, Logan and Shelby; district 14, counties of Darke, Miami, Champaign, Clark and Montgomery; district 15, counties of Richland, Morrow, Marion, Union, Delaware and Franklin; district 16, counties of Preble, Butler and Hamilton.

INDIANA DIVISION

District 1, counties of Steuben, DeKalb, Noble, Lagrange, Elkhart and Kosciusko; district 2, counties of St. Joseph, Marshall, Starke, Laporte, Porter and Lake; district 3, counties of Allen, Whitley, Huntington, Wells and Adams; district 4, counties of Blackford, Jay, Delaware, Randolph, Henry, Wayne, Union and Fayette; district 5, counties of Wabash, Miami, Grant, Howard, Tipton, Hamilton and Madison; district 6, counties of Fulton, Cass, Carroll, Pulaski, Jasper, Newton, Benton and White; district 7, counties of Warren, Tippecanoe, Clinton, Fountain, Montgomery, Boone and Vermilion; district 8, counties of Hendricks, Putnam, Parke, Clay and Vigo; district 9, county of Marion; district 10, counties of Hancock, Rush, Decatur, Bartholomew, Brown, Shelby and Johnson; district 11, counties of Franklin, Dearborn, Ripley, Ohio, Switzerland, Jefferson and Jennings; district 12, counties of Morgan, Owen, Monroe, Lawrence, Greene and Sullivan; district 13, counties of Knox, Daviess, Martin, Pike and DuBois; district 14, counties of Jackson, Scott, Washington, Clarke, Floyd, Harrison, Crawford and Orange; district 15, counties of Perry, Spencer, Warwick, Vanderburg, Posey and Gibson.

MICHIGAN DIVISION

District 1, county of Wayne; district 2, counties of Monroe, Lenawee and Hillsdale; district 3, counties of Branch, St. Joseph, Cass and Berrien; district 4, counties of Kalamazoo, Van Buren and Allegan; district 5, counties of Calhoun, Jackson, Eaton, Barry and Ionia; district 6, counties of Washtenaw, Ingham, Livingston, Clinton and Shiawassee; district 7, counties of Lapeer, Genesee, Oakland and Macomb; district 8, counties of Huron, Tuscola, Sanilac and St. Clair; district 9, counties of Gladwin, Arenac, Bay, Midland, Saginaw and Gratiot; district 10, counties of Oceana, Newaygo, Muskegon, Kent, Montcalm and Ottawa; district 11, counties of Mason, Lake, Osceola, Clare, Isabella and Mecosta; district 12, counties of Manistee, Wexford, Missaukee, Kalkaska, Grand Traverse, Benzie, Leelanau, Antrim, Manitou, Charlevoix and Emmet; district 13, counties of Roscommon, Ogemaw, Iosco, Alcona, Oscoda, Crawford, Alpena, Montmorency, Otsego, Cheboygan and Presque Isle; district 14, counties of Mackinac, Chippewa, Luce, Schoolcraft and Alger; district 15, counties of Delta, Menominee, Dickinson, Iron, Marquette, Baraga, Houghton, Keweenaw, Ontonagon, Isle Royale and Gogebic.

OTHER STATE DIVISIONS

The districts for Illinois, Iowa, Wisconsin, Minnesota, Missouri, Kansas, Kentucky, Tennessee, Colorado, California and other states will be announced in due order.

WINTON

Up-Keep Reduced by Ground Cylinders and Pistons

Insist upon having **GROUND** cylinders and pistons.

Because GROUND cylinders and pistons protect your pocket-book.

The only perfect automobile engine—the only engine that does not leak compression and eat itself up with friction—is the one that has **Perfectly Circular** Cylinders and **Perfect Fitting** Pistons.

Cylinders are either bored or reamed, or GROUND.

The Horseless Age says: "In automobile engines the cylinder walls are necessarily thin, and when the surface is finished by boring or reaming, there is a continual tendency of the iron to spring away from the cutting tool. If there are hard and soft spots in the iron it is almost **impossible** to have the boring tool cut a perfectly round hole, as the iron in this thin shell will spring away from the tool and come back again after the tool has passed on. With **grinding**, however, this is **not the case**, because there is not the pressure against the walls of the cylinder with the grinding wheel that there is with a boring tool."

The GROUND cylinder, then, is exactly ROUND, while the bored or reamed cylinder is not.

When cylinders are not perfectly round, the pistons cannot fit perfectly, and consequently compression leaks through the uneven places into the crank chambers.

All compression that leaks represents just so much wasted power and wasted money. You pay money for gasoline to make power, and part of that gasoline slips away at every piston stroke when the cylinder is not ground.

A 40 H. P. engine with bored (leaky) cylinders may only produce 20 actual H. P.

The 30 H. P. Winton Model K, with **perfectly ground** and **perfect fitting** cylinders and pistons produces 30 actual H. P. No waste power, no waste of money, but an engine that turns your money (gasoline) into driving power.

In addition to wasting power, non-ground, uneven cylinders and pistons begin their own ruin the first minute they run. One uneven spot working against another soon puts cylinder and piston out of business. Then repairs, replacements and EXPENSES.

But the **perfectly ground, perfect fitting** cylinders and pistons of the Winton Model K have no rough spots, no wear. They run indefinitely in perfect condition, saving gasoline, power and money and cutting out repair bills and replacements.

Winton Model K—Four cylinder, vertical, water-cooled. 4¾ inch bore, 5 inch stroke. Individual clutch transmission. Winton Air Governor. Best systems of lubrication, ignition and carburetaton. $2,500 f. o. b. Cleveland. Catalog No. 3 is ready.

What the New York Papers Said About

FIAT

AUTOMOBILES IN THE

Vanderbilt Cup Race

LANCIA, THE ITALIAN.

Virtually the victor in the great contest. He is rammed by an American and is then forced to abandon hope and the battle.

To France the cup, to Italy the glory.

Whatever the figures may say, that was the true result of the international automobile race for the Vanderbilt trophy.

Officially August Hemery, in his eighty horsepower Darracq, was proclaimed the victor,. Popularly the laurels went to Vincenzo Lancia, in his marvelous Fiat, from Turin, with 120 horsepower. More than 150,000 persons who saw the event voiced that verdict at the end.

Flying over the earth like a projectile propelled by some superhuman force and with incredible intrepidity, Lancia led from the start and had literally run away from his competitors when the disaster fell upon him. He had covered seven of the prescribed ten laps, a distance of 196 miles, in 170 minutes, more than a full lap ahead of his nearest antagonist, and was consistently maintaining this amazing speed with a virtual certainty of breaking all records.—*Herald.*

LANCIA LEADS ENTIRE FIELD.

Heading the entire field of competitors by more than thirty miles, Lancia completed the seventh turn at 8:52 o'clock and was greeted with a mighty cheer. He was still traveling at about seventy miles an hour, but notwithstanding his terrific going he turned in his car and waved his hand in appreciation of the cheers.

Lancia, the Italian, would undoubtedly have won but for the collision with Christie. He had broken all speed records up to the time of his accident.—*World.*

LANCIA'S BRILLIANT WORK.

Those who saw the race will understand that it is not unfair to the winners to say that the driving of Lancia, the Italian, was the sensation of the day. Taking the lead on the third round, he held it lap after lap, and was leading by over twenty minutes. Such driving and such a perfect machine were never seen before in the United States.

Lancia apparently opened up his Fiat when he received the word "Go!" and never closed it down. Foxhall P. Keene, than whom there is no better authority on automobile racing in the world today, was unstinted in his praise of the foreigner. Mr. Keene said:

"I never saw such driving before, nor such a smooth running car. There is no one in the race today who can follow the pace set by the Italian."—*Tribune.*

The feature of the race was the wonderful driving of Lancia, the Italian, in his Fiat.

The stands stood up and cheered him again. Such driving had never been seen in this country before. With six racers behind him and with a generous lead, the race seemed his, barring accidents.—*Sun.*

LANCIA SEEMED A SURE WINNER TILL CHRISTIE RAN HIM DOWN.

The Christie car cheated Lancia, the Italian, on his 120 horsepower Fiat, out of the greatest victory ever won in an automobile race while Lancia was far ahead of his closest rival. Walter Christie drove his car into the Fiat and smashed its side.

Lancia drove a phenomenal race. He set a pace of more than seventy miles an hour. The Italian driver varied hardly ten seconds on any of his rounds up to the time his car was injured.—*Eagle.*

TRAIN RECORDS LEFT BEHIND.

Fastest Railroading in the World Takes a Back Seat to Lancia.

The figures of Lancia up to the time he met with a mishap yesterday easily eclipse those records. The fearless Italian driver negotiated the first 198 miles of the Long Island course in the incredibly brief period of 150 minutes. So far as is known, this is not equaled by any regularly scheduled railroad train.—*Eagle.*

LANCIA LOST BY ILL LUCK.

When thirty miles ahead his machine is wrecked. Beat a mile a minute. Italian driver made better than 80 miles an hour in straight sections.—*Times.*

Lancia's completion of the seventh round put him a lap ahead of the entire field, something unheard of before in motor racing. His time was 2:49:52, or 169 minutes for 196 miles, an average of almost seventy miles an hour, an unprecedented performance in an auto race either here or abroad. World's records were falling like hail. Lancia's speed was increasing each time. His fastest lap being 23:10 or 72½ an hour.—*Globe.*

LANCIA HERO OF RACE.

Lancia, of the Italian team, was the hero of the fastest lap, and, though he only finished fourth, 1 minute 55 seconds behind Tracy, the American, he was the popular hero of the race.—*Press.*

Lancia, before his accident, did some of the most wonderful driving ever seen in America. He completed half the total distance of 283 miles in two hours, two minutes and five seconds. This was 142 miles in 122 minutes. Wm. K. Vanderbilt said: "The race was a very great success and remarkable speed was made. Lancia drove a very fine race, and had it not been for his unfortunate accident would have made a marvelous record for the course.—*Journal.*

Intending purchasers should call and inspect Fiat Cars. Both closed and open bodies now ready—the product of the foremost European and American designers, completely equipped, ready for the road when purchased.

The Economy of
FRANKLIN
Air-cooling

Not only does *Franklin* air-cooling do all that water-cooling will do, but does it better, easier and cheaper.

In the famous Long Island Economy Test last June a *Franklin* car won the trophy over sixteen competitors—nearly all water-cooled cars—though three of them were steamers.

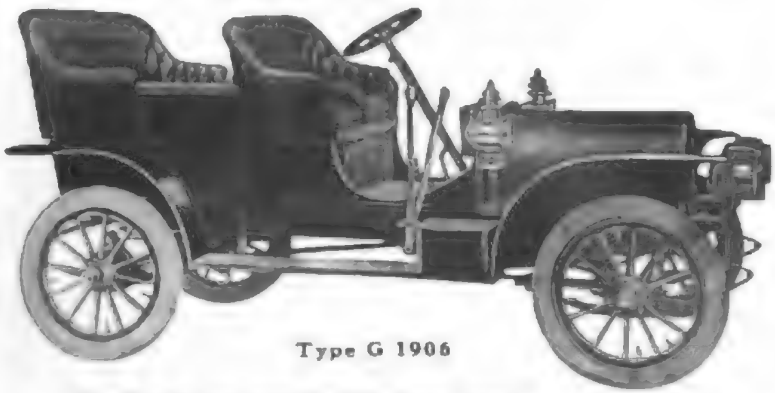
The cost of oil used by the winning *Franklin* was	.44
The gasoline cost	2.44
Tire repairs	.25
A total of	$3.22 **to carry four people 190 miles.**

When the air-cooled *Franklin* cut the best water-cooled record between San Francisco and New York from 61 down to less than 33 days, the whole trip of some 4,500 miles was made on 201 gallons of gasoline and a proportionately small oil consumption.

Over the hottest part of the route—from Wadsworth to Ogden—across the furnace-like Humbolt Sink, the air-cooled *Franklin* made double the distance each day that was made by its water-cooled rival and no trouble from hot cylinders.

Mr. W. A. Beardsell, Madras, India, in his 1904 type 10 h. p. Franklin runs one hundred miles on three gallons of petrol and with four passengers does a mile in 1.55.

A few large cold facts of this sort—and we can give you a hundred of them—are all a reasonable man needs to settle forever the question of *Franklin air-cooling economy.*



Type G 1906

Four 1906 Models

Type E. Four-Cylinder Runabout or Gentleman's Roadster.
Type G. Four-Cylinder Light Touring Car.
Type D. Four-Cylinder Touring Car.
Type H. Six-Cylinder Touring Car.

Type G 1906. 4-Cylinder Light Touring Car.

Four cylinders. Air-cooled. Shaft drive. Sliding gear transmission. Three speeds and reverse. New and perfect disc clutch. Force-feed oiler on the dash. 4 or 5 passengers. Side doors. 88-inch wheel base. 32 "Franklin horse-power." 1,300 pounds. 35 miles per hour. Full head and tail-light equipment. $1,800, F.O.B. factory.

This will be the most popular car of the coming season.
It will suit more people, and suit them harder, than anything else on rubber tires.
It has all the "go" of the *Franklin* motor; *Franklin* lightness and super-strong construction; the ease of *Franklin* spring-suspension; and the *Franklin* bigness of capacity without excessive bulk, weight and operating cost.
There isn't another car that will do so much for the money. There won't be for many years.

The Car You Ought to Have, at the Price You Ought to Pay

1906 MODELS

We have commenced deliveries on Model 4B and Model 2B of our 1906 line. Both of these cars are considerably improved over 1905 and several valuable features have been added, but no pronounced changes have been made in the construction of either as the success of both has been too decided to warrant it. The car illustrated on this page is

MODEL 2B

2 cylinder, 8 h. p., vertical motor, mounted in front.

$750

No car at any price surpasses this magnificent runabout in smartness of appearance or absolute dependability. It is as carefully designed and built as any $3,000 or $4,000 car on the market.

It has ample power for every condition of road, climbs hils with perfect ease and stands unquestioned by all who *know it*, the best car in the entire world at the price.

Write for 1906 catalogue—the handsomest ever published.

What concerns you is not the size of the engine nor the horsepower the maker claims for it. You are only interested in the results---hill climbing---road speed---power in sand, etc.

We have said a lot at various times about getting a greater proportion of the engine horsepower delivered to the rear wheels of the STEVENS-DURYEA than any other car.

There never was anything easier to satisfy yourself about---a bit of sandy road---a stop-watch---the STEVENS-DURYEA'S time vs. the other car's time---the size of the STEVENS-DURYEA engine vs. the size of the other.

ANNOUNCEMENT

The New Model 1906 Rainier

30-35 H. P.

has arrived. Note specifications below, then inspect it and try it. Experts who know Auto-cars from A to Z will be forced to admit that in beauty, workmanship, enduring strength and every other requisite of a perfect touring car, this magnificent new Rainier is THE American Automobile.

Engine—30-35 H.P., 4-cylinder, water-cooled.
Ignition—Sims-Bosch Magneto. Make and break spark.
Transmission—Sliding train, three speeds forward and one reverse.
Rear Axle—Bevel gear drive, clutch driven hub, ball bearings.
Front Axle—I beam section, ball bearings.
Frame—Cold rolled pressed steel, aluminum under-bonnet covering entire engine and transmission.
Wheel Base—104 inches.
Wheels—Imperial whalebone, grade A second growth hickory.
Tires—Continental, 34x4.
Valves—Mechanically operated, inlet and exhaust interchangeable.
Carbureter—Float feed, requiring no adjustment.
Brakes—Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
Body—Full aluminum, double side entrance.
Equipment—Two headlights, 2 side lights, 1 rear light, 1 horn.

Price, $4,000

The 22-28 h. p. will be continued as heretofore without any changes. 4-cylinder, 98-inch wheel base, La Coste coil, French battery, Continental tires, aluminum side door body.

Price, $3,500

Both models guaranteed free of repairs for one year. The world's broadest and most liberal automobile guarantee.

Landaulet bodies for immediate delivery. Limousines for October and November delivery.

Peerless

1906 Peerless at the end of the Buffalo trip

The Peerless 1906 Model

is our attempt to make the best car that can be built. Frankly, we are proud of it. The new car has been tested out under the most difficult conditions we could devise. After days and weeks of the hardest kind of tests on the hills and on the level, in which it came out with flying colors in every case, it was sent 400 miles over the road, through the mud. Twenty-eight miles an hour from Cleveland to Buffalo over rough and muddy roads with four people in the car is certainly more than creditable for the first car finished. Especially since it came back to the factory in the same perfect condition that it went out, and that without an adjustment.

SEND TODAY FOR 1906 INFORMATION

Surely the new model of the same car that holds the stripped touring car record of 58 3-5 seconds and the 1000 mile non-stop record, ought to be thoroughly considered if you are looking for the best car.

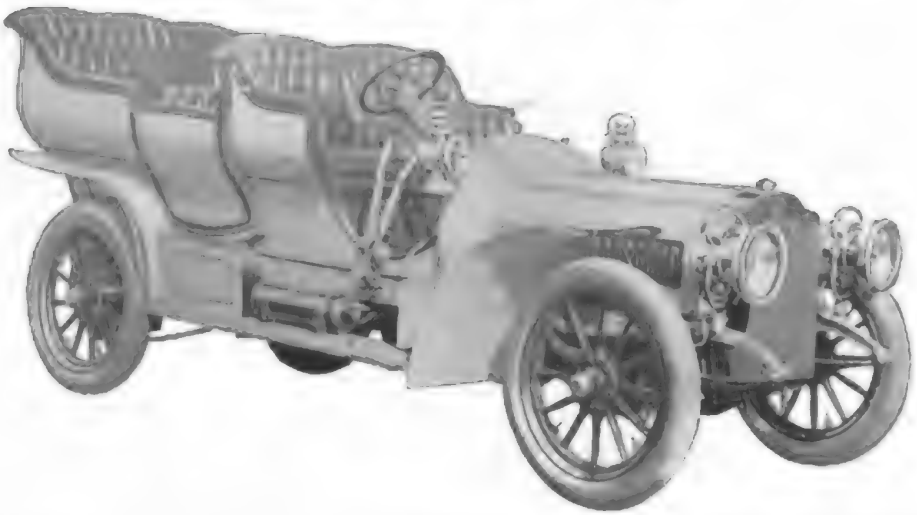
THOMAS
1906



In spite of the fact that we are completing the finest fire-proof factory in the world with a capacity of one thousand high powered automobiles per annum, it looks very much as though last year's scramble for Thomas Cars was going to be repeated.

Last year, premiums of all the way from $150 to $750 were refused for Thomas cars. We were likewise compelled to refuse orders for 50 per cent of our capacity.

The only sales we lost were those of a few unposted persons here and there, who couldn't see how so much value could be sold at so reasonable a price.

That idea was demolished last season and the fact that the 1906 Thomas is far costlier than the 1905 model without a change in price makes it unquestionably the greatest automobile value in the world today.

In brief what you have to consider is a car which demonstrated last year its superiority to cars costing from $1,500 to $4,000 more money.

A car with 50 H. P. (actual) which is quieter than it was last year; smoother than it was last year; has larger motors; is far more beautiful; far more comfortable, seating five or eight all fronting forward; with perfect clutch; perfect control; four-speed Hess-Bright Ball bearing transmission; four powerful brakes; forgings throughout; material guaranteed to be the costliest made; fifteen Hess Bright Bearings and one roller.

Analyzing this 1906 offering of power, beauty and the highest degree of construction, and bearing in mind what I have said to you about the probability of a greater demand than we can supply even with our increased capacity of 1,000 high powered automobiles per annum—do you not think it advisable for you to investigate the Thomas without delay by consulting our nearest representative?

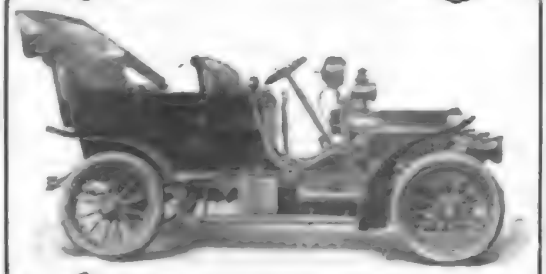
THE CAR OF SIMPLICITY



A Reliable Brake

is very important on an Automobile at all times; whether ascending or descending grades or running on the level.

¶ The Brakes on the CLEVELAND CAR—three—are positive in their action, and can be relied upon to perform their duty in any emergency. Any one of the three Brakes on the CLEVELAND when applied, disengages the clutch.

¶ The Emergency Brake is operated by a lever at the rights of the driver, and consists of one double-acting internal expanding bronze shoe, mounted in each of the rear hub drums.

¶ This Brake is so effective when applied, that it is possible to stop the car almost instantly.

¶ If you will send for our new Catalog, which contains full descriptive matter and illustrations, it will tell you more than the limits of an advertisement will permit.

IMMEDIATE DELIVERY 18-20 H. P. $2,800

Congratulations

From a dealer in a rough-road country on the service obtained from

GOODRICH TIRES

WITH THE BAILEY TREAD

"We wish to congratulate you because of the splendid way your Goodrich-Bailey Tires have given satisfaction and service to us and our customers. They not only wear longest with the least show of use, but seem to be free from weak spots, such as fabric breaks and rubber and fabric parting company on the Tread, *the latter seems to be a sure thing on some tires that we know of.*

We are looking to 1906 Goodrich and expect to be partial to them because we believe they deserve it, if their previous reputation is any criterion to go by."—*Ashville Cycle and Auto Company, Sept. 23, 1905.*

THE BAILEY "WON'T SLIP" TIRE. Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been inspected and pronounced perfect. We guarantee our tires only on rims so branded.

DEALERS

During 1905 we built and sold more than 4,000 Cadillac cars.

Not one purchaser of these cars is willing now to let his "bargain" go at less than the price he paid for it.

For 1906 that name

CADILLAC

will possess more than ever before a magic meaning to live dealers.

There are hundreds of towns in the U. S. where Cadillac cars have never been sold. We want an agent in each of these localities and if **you** are a **good business man,** you will at once get in touch with us. No line was ever so attractive as ours will be for 1906.

The "short" fracture shown above, while characteristic of poor oak, happens to show the fracture of poor hickory. The other fracture shows the quality of "Imperial" spokes.

Talks on Wheel Making No. 5

A burned tire is robbed of its danger if the car is equipped with "Imperial" wheels.

What you get for your money is of much more importance than the price you pay. Wheels which are represented as being made of selected second growth hickory may, and usually do, differ greatly in quality.

The difference is that which exists between timber selected "on the ground" and timber selected "at the factory." The material for Imperial "A" grade wheels is selected at the factory only after it has passed the most careful inspection. We own the tracts of land where it grows. The age of the timber, the time when it is felled, how long it lies, how it is corded, the period of its seasoning, the part of the tree from which it is cut, its specific gravity all the matters essential to quality are known to us and under our control.

We have the best equipped automobile wheel building plant in the country.

The excellence of "Imperial" wheels is based upon the perfection and refinement of orthodox methods.

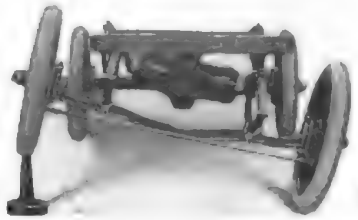
THE MARMON

"A Mechanical Masterpiece"

Front Wheel Raised Over a Foot



Body Level

In a Class by Itself

Anyone can see at a glance that the Marmon is unlike other cars. And it needs but little study to show you that it is better.

For instance, its luxury of motion. When you are speeding over rough roads in a Marmon, you don't spend your time bouncing up in the air. You don't know that most of the bumps or ruts exist, you ride them as gracefully as a sailboat rides a wave.

And the same exclusive patented feature that makes this possible in the Marmon—and in no other car—is as great a blessing to the entire mechanism as it is to the passengers.

Compare any other car with a log wagon and you will find that of the two the log wagon has the better principle of construction. Its front axle is movable—providing some elasticity—and it has no costly mechanism to protect. The sole advantage of the automobile lies in its springs; but no kind or combination of springs will correct the error of an unyielding, unnatural construction. Put it to the test illustrated above.

The Marmon possesses the exclusive *patented* feature,

Double Three-Point Suspension

Solid cast aluminum body on one frame, power plant on another frame, *each frame* suspended on three *pivotal* points. Eliminates the jolts and binding, twisting strains inevitable in the rigid suspension of all other cars; and keeps the power plant and rear axle always in perfect alignment. Means fewer parts, simpler parts and less wear on all parts, tires included. Permits the use of a perfectly straight rigid shaft drive, *without Cardan joints*, delivering a greater percentage of motor power to the wheels than is done in any other car. Four cylinders; air-cooled.

The Marmon oiling system is superior to splash, gravity or any other known scheme of lubrication. Starting and stopping with the engine, a constant and uniform flow of oil is forced through the hollow crank shaft directly into all the main engine bearings, crank and piston pin bearings. Has no uncertainties, no adjustments and is very economical.

Stylish, strikingly handsome and very quiet. Replete with distinctive features that appeal instantly and forcefully to all who seek a strictly high-grade car.

Write for Booklet No. 1 and become posted on the finest car of the times.

Here's a Record for You!

A 1906, 4-cylinder **HAYNES** stock Touring Car, stripped, with a racing seat on it, proved its utility by its remarkable performance in the elimination trials for the Vanderbilt cup.

Especially constructed racing monsters were completely outdistanced by the **HAYNES**.

But one stop was made during the entire race, and this through no defect in the mechanism of the machine.

Isn't this a wonderful record?

Isn't this pretty good evidence in support of our claims?

And—better still—isn't the **HAYNES** a good car to sell **because** of this evidence of endurance, speed and simplicity.

Agencies are now being contracted. Send in your application at once.

Orders for **exact duplicates** of this car are now being booked in the order of their receipt.

Write at once.

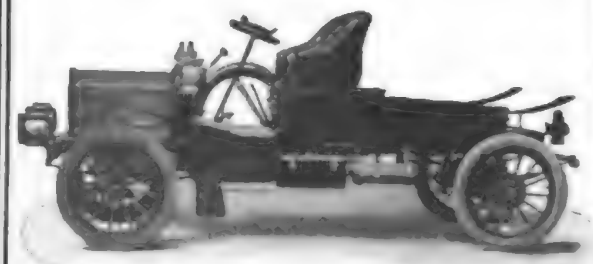
THE INCOMPARABLE

WHITE

THE CAR FOR SERVICE



The White Runabout

If seating capacity for two is sufficient for your needs, you would do well to inspect critically the White Runabout—our regular chassis fitted with runabout body.

It, of course, possesses all those qualities of simplicity, durability and reliability which have made the White the favorite touring car of this country. In addition, is the increased speed which results from the lessened weight. The price, furthermore, is less than that of our touring car. The White Runabout should certainly appeal strongly to those who wish a stylish, speedy and silent car.

A SUMMARY of TIRE RESULTS in the Vanderbilt Cup Race

Of the four sets of tires which finished the Vanderbilt Cup Race only *one set* ran the entire ten rounds *without change, without injury*, and without attention in any way.

These were the Diamond Wrapped Treads on the *Locomobile* driven by *Joseph Tracy*. At the end of the race their condition was perfect.

Four foreign cars discontinued the race because of tire trouble, and it is everywhere conceded that tire trouble cost Lancia first position. The equipment on these five cars represented the three best known European and English makes of tires.

Diamond Wrapped Tread Tires

Contributed to the aggregate of all tire trouble in the race from 50 per cent to 600 per cent less than any other make of tire represented, and this notwithstanding that with one exception they outnumbered every other make of tires used.

All five of the American cars were equipped with Diamond Tires. On four there was no tire trouble whatever. The total of all tire trouble suffered by American cars was two casings changed and one new tube put in, due to puncture.

On the Christie car, which never before participated in a race without serious tire trouble, and which never before ran on Diamond Tires, the record was perfect. Even the wheel-smashing collision which this car suffered did not injure the tires.

Only five cars participating in the race escaped without changes of tires being made. Four of them used Diamond Wrapped Treads.

In short, the remarkable record for both endurance and speed made by Diamond Tires in the Vanderbilt Eliminations, and in the Gordon Bennett race, were in every way confirmed by their performance in the great contest of October 14th.

There can be but one conclusion—Diamond 1906 Wrapped Tread Tires are without an equal in the world.

The Hartford Perfected Dunlop Tire

Paris, July 28, '05.

Dear Sirs:-

We have arrived in Paris coming over the Route Nationale from Aix les Bains via Lyons and Nevers. The roads were exceedingly trying, very hard and a lot of "pave" or cobblestones. I had two punctures. These were the only mishaps in 2136 miles and the tires have stood the hard work without showing any other signs of wear and tear. People here consider this a very good record as many of the best foreign tires blow out from the heat.

Yours truly,

Walter Hale

Postal No. 3.

Watch for others to follow.

The Hartford Rubber Works Company, Hartford, Conn.

Will you write us about the

1906 Agency for the Wayne?

The Wayne Agency for 1906 is a good thing. The Wayne Cars were extensively advertised last year in all the leading magazines and trade papers. For 1906 we have made arrangements for a campaign of cooperation with our local agents which will mean practical assistance in selling Wayne Cars. We realize that to get good agents it is necessary for the agent to have a proposition on which he can make money, and the Wayne agency proposition is one which it will pay you to investigate.

The Wayne line for 1906 is comprised of cars that have proved their ability to stand hard usage by three years' road service.

We have not changed the Wayne principle of construction because nobody has yet been able to show us anything better tho' our cars contain all new improvements and are strictly up-to-date (no old models built over).

WRITE US AND FIND OUT WHAT WE HAVE TO OFFER, BEFORE YOU FORGET

PENNSYLVANIA CLINCHER

There are no perfect Motor Cars, nor any perfect tires—as yet;

But if you have a car which you consider almost perfect, perhaps you would like a tire fit to associate with it.

PENNSYLVANIA RUBBER CO.
JEANNETTE, PA.

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

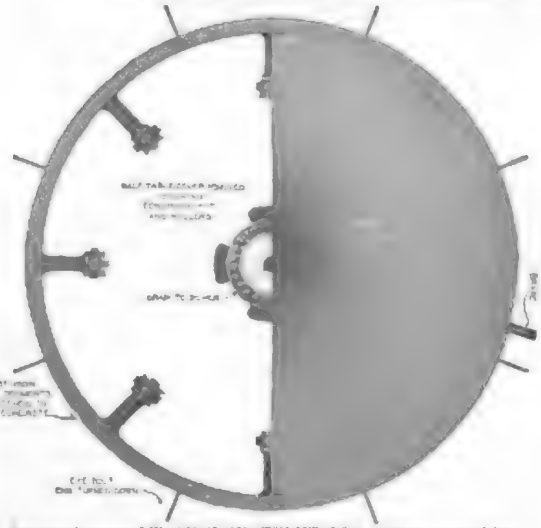
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

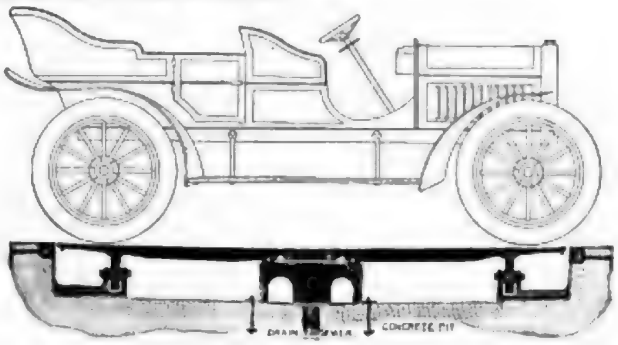
It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.





Sectional views of WASHSTAND TURNTABLE. Patent applied for.

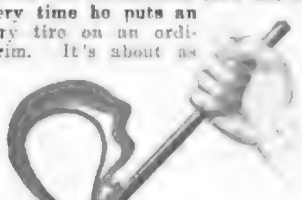
Why Goodyear Auto Tires Won't Creep

DID you ever try to force an inch tube over an inch and a quarter bar—or to put a pair of No. 7 gloves on a No. 8 hand?

You wouldn't be so foolish, would you?

But that's to all intents and purposes what the Automobile Man has to do every time he puts an ordinary tire on an ordinary rim. It's about as



hard work as breaking into a bank, and he goes at it the same way, with a "jimmy" and other burglar's tools. Because a 26-inch wheel (for example) is really *27 inches* in diameter, when you consider the flange. So a 26-inch tire has to be forced over a 27-inch rim every time you put on a tire, or take it off.

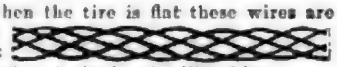
It's a heart breaking job, even for a strong man, and it takes from half an hour to an hour each time you do it.

And after you have removed such a tire a few times, the base of the tire becomes stretched, and the fabric (used to strengthen it) becomes broken in places, until this tire becomes 27 inches in diameter instead of 26, a full inch larger than the face of your wheel. So you have to bolt it down, or it will creep, tear the valve out and cause all kinds of trouble. And even then you have to keep it pumped up continually as hard as it will stand.

Now the Goodyear Detachable Auto Tire can't creep, because, in the first place, it doesn't have to be *forced* on (if you use the Goodyear Universal Rim). The 26-inch tire slides right on to the 26-inch rim as easily as you would put on your hat. It doesn't have to be pried over a 27-inch flange.

And next, at the first stroke of the pump, the tire begins to grip the rim like grim death. Because there is a mesh or tape of piano wire vulcanized clear around the tire on each side of the base.

When the tire is flat these wires are like this:



And each single wire like this:

The instant you begin to pump, this wire begins to shorten like this:

And when the tire is pumped up hard, the wire mesh is like this:

If you put a Goodyear Auto Tire on a wood rim, and pump it up hard, the pressure will be so great that the base will squeeze a ridge in the wood.

So the Goodyear Auto Tire need be only *half* inflated, and it will still have a firmer grip on the rim than it is possible to secure with plates and bolts.

This, however, is only *just one* of the good points of this trouble-saving tire.

You will find other points in our "Good News Book." It is vitally interesting to every manufacturer, dealer or user, for it shows the way to perfect relief from Tire Troubles. It's FREE. Ask for it.

SEARCHLIGHT SWINDLERS

The success of the Rushmore Lens Mirror Searchlight has been so complete that as a matter of course the lantern makers have been compelled to either try to imitate it or go out of business.

A number of them have conspired to keep us out of the automobile shows, have claimed that we do not make the celebrated Rushmore Lens Mirror and that they get their cheap flat lenses from the same place, and have resorted to every contemptible trick to deceive people into buying their trash.

Certain so-called jobbers have tried to push the sale of the imitation lights by issuing lists of what are insinuated to be our prices in comparison with their alleged cheap prices. The statement that we ask the prices quoted is a deliberate and malicious lie. The prices they offer are but a few cents lower than ours, while the fake lights they offer are by comparison not worth their weight as junk.

Some of the fake jobbers refuse to furnish the Rushmore light when requested to do so on the plea that we cannot make delivery. That statement is likewise a deliberate lie. They offer to refund your money if not as represented, but you had better hold on to your cash.

We do not ask any money in advance, but will send the Searchlight on ten days' free trial to anyone worthy of credit. The fake jobber can make but 25 per cent to 30 per cent on the Rushmore, while he clears 100 per cent to 200 per cent on the fake lights which he obtains on consignment. Do you wonder that he is willing to cheat you?

Our prices are the lowest for the quality and we ship from stock.

RUSHMORE DYNAMO WORKS, = Plainfield, N. J.

G&J

MOTOR CAR TIRES

The Most Serviceable Tires Made

No Internal Heating. The thread fabric construction makes the tire so pliable that it changes position in service with the least possible resistance, which means that the tires are very resilient, fast and free from internal heating.

No Pinched Tubes. The tire is fitted with a flap, which prevents the tube from coming in contact with the rim, or from getting under the edges of the case, preventing pinched tubes.

No Creeping. The flap forms a strong frictional contact with the edges of the clinches, holding the edges firmly to the rim for its entire circumference, so that it is impossible for the tire to creep.

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the two cycle two cylinder Elmore engine. Understand—the two cycle two cylinder Elmore engine produces **two impulses every time the flywheel turns.** As you know, the two cylinder four cycle furnishes only one impulse every fourth time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

Indianapolis, Ind.

Gentlemen:
I am sending you, as I promised, a copy of the photograph taken at Coldwater, Michigan, of the new "24" test car. You will notice "old faithful" on the right-hand running board. These tanks of yours are certainly wonderful for their great convenience on trips like this, and, in fact, for general touring. We have equipped a large number of cars with them, and are using them on factory cars without having discovered any disadvantage whatever. Trusting that the picture enclosed will reach you in good condition, I am,

Yours truly,
PACKARD MOTOR CAR COMPANY.

To be had of all dealers. Empty tank exchanged for full one by any dealer.

TANK RECHARGED AT SMALL EXPENSE BY ANY DEALER

The Care *of the* Car

Washing the body of the machine, keeping the polished surface free from lubricator, road dust and gutter muck is just as essential to the life of an Automobile, as is the attention given the running gear.

Mobo, the new cleanser for Automobiles, will easily and quickly remove grease, dirt and grime and all traces of a hard run, without dulling or scratching the highly polished surface.

MOBO

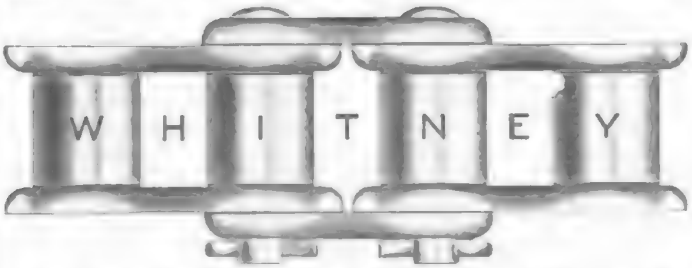
is unlike common soap, as it positively contains no free alkali. Being a preservative as well as a cleanser, it prevents varnish or paint from peeling or cracking, and adds a fine gloss to the surface

Mobo may be used with profit on leather goods, harness or woolen fabrics. Cannot harm the most sensitive skin, as it is a purely vegetable oil preparation and absolutely contains no free alkali. Put up in 2-lb. and 8-lb. cans; also in tubs, half barrels and barrels.

If your supply man does not keep *Mobo*, send us his name and address, and we will see your wants are supplied.

JOHN T. STANLEY
New York.

1906 Model "WHITNEY" Detachable Roller Chain—Patented



THE WHITNEY MFG. CO., Hartford, Conn.

"Whitney" Standards for dimensions of Roller Chains have been adopted by most of the leading American automobile builders, and at last they have been accepted by other chain makers at home and abroad. For 1906 Model Cars of all styles and weights, six sizes of chain can take the place of over thirty sizes used in the past.

Watch the cars with the efficient Double Chain Drive, and equipped with the latest Model Noiseless "WHITNEY" Chains.

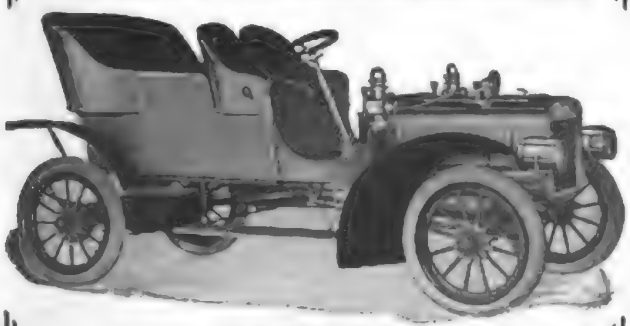
MOLINE



18-20 HORSE POWER

Model "B"—$1,600

Four cylinder vertical motor that develops more than the rated H. P. Pulls through heavy roads and up hills in a way that surprises the owners of higher-priced cars.
Has all the good features of most $2,000 machines and costs $1,600.

For the first time this season we can make immediate deliveries

We have only a few of them left and they will go quickly. Perhaps our proposition might interest you.
Model "D"—Our stock of these substantial 12 H. P. Touring Runabouts is decidedly limited. The price we are making is closing them out fast.
If you want one, speak quick.

POPE Waverley ELECTRIC AUTOMOBILES

The dull season made profitable for the agent by the sale of POPE-WAVERLEY ELECTRICS

Do you realize how much extra money you can make by pushing the sale of Electric Automobiles? The Pope-Waverley Station Wagon and the Coupe-Top Chelsea are so particularly adapted for fall and winter use that it is only necessary to bring their good points to the attention of the people to secure profitable customers.

We can make prompt deliveries on these models and will be glad to have you visit our Indianapolis factory and see the reason for our enthusiasm on the future of the Electric carriage. We make 15 distinct models, $850 to $2,750.

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,

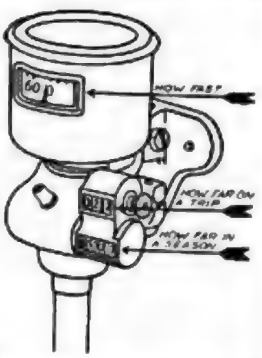
THE AUTO-METER "BUILT LIKE A CHRONOMETER"

TELLS THE SPEED OF TRAVEL TELLS THE DISTANCE TRAVELED

Tells both with absolute accuracy



The Speed Dial, six inches wide and easily read, records the speed of a car from a fraction of a mile to sixty miles an hour and does it unerringly.
The Trip Dial records the distance traveled on a trip or for a day.
The Season Dial records the total distance covered in a season.
There is satisfaction in knowing how fast your car is traveling, satisfaction in knowing how far it has traveled. You enjoy this double satisfaction with an Auto-Meter on your car. Some one of your friends surely has one. Ask him about it.

In the meanwhile let us send you a catalogue and interesting pamphlet, "Indisputable Evidence."

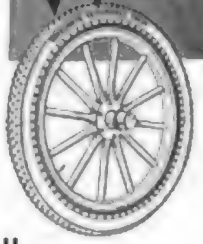
WOODWORTH DETACHABLE TREAD



For Automobile Tires

Is the proper equipment for fall and winter use. prevents slipping and skidding on muddy or icy streets. It also protects the tires from hard, frozen roads. The treads can be put on without removing the tires from the wheels. They are held rigidly on the tires by side-wires which pass through the loops and are tightened by small nuts. No special tools or equipment are required to apply them—with a wrench and a pair of pliers anyone of ordinary ability can do the work.

Can be used on any pneumatic tire, no matter how badly worn, if it is strong enough to stand the air pressure.

You will need something for use for this fall and winter. Why not get the best thing there is?

They are not exorbitant in price.

BRISCOE MFG CO.

OLDEST AND LARGEST MAKERS OF

AUTOMOBILE RADIATORS

DURING the past season we sold 12,945 radiators to 54 bona fide motor car manufacturers among whom are nearly all of those who have produced high-grade and successful cars.

Over 30,000 of our radiators are now cooling automobile engines.

Our standard honey comb radiators are of true cellular construction, allowing cross circulation and accounting for their high-cooling efficiency per pound of weight of cooler.

The hit of the year 1905 in radiator design has been our flat tube construction with gang fins. We make special designs for every class of car from the light runabout to the heaviest truck or omnibus.

The finish on Briscoe fenders is unexcelled. 1906 styles on metal dashes, hoods and runabout boxes are prepared and we are daily booking contracts for next season's business.

By dealing with us you get the benefit of our long experience and the protection of the many patents we own, covering our methods of construction.

The Pierce Great Arrow car which won the Glidden trophy was equipped with a Briscoe radiator. Of the twelve American water-cooled gasoline cars which received first certificates at the end of the tour six of the radiators were made in our shops, four were made by the car builders, and only two were made by other radiator manufacturers. These facts are typical of our prestige.

Our two large plants are ready to take care of our rapidly increasing business. We cannot only promise but make deliveries.

Write to our nearest office for estimates and get in line for 1906.

THE HAM GOLD BLAST AUTO LAMPS

"THE LAMPS THAT LIGHT THE ROAD"

MR. MANUFACTURER:

Don't close your lamp contract for 1906 until you look over our line. We have no competition in light giving and burning qualities, and our lamps will surely interest you.

MR. DEALER:

Isn't it worth something to sell your customers lamps that will not only satisfy them, but will bring them back to tell you what a fine light they give, how steadily they burn in the strongest winds and over the roughest roads, and what a good fellow you are for selling them good lamps. They'll tell their friends about it, too.

MR. AUTOMOBILIST:

Are you discouraged with the oil lamp proposition? If you are, we know you haven't tried the

HAM COLD BLAST AUTO LAMPS

because they are a delight to the most critical. They are strongly built, handsome in appearance, give a powerful light, and are always reliable, as they are wind proof and will not jar out. Never smoke, consequently the interior is always bright and clear, and there is no odor.

The Persuasive Instrument

¶ The average person who drives a motor car has a desire to speed—to "let 'er out."

¶ But we have yet to find the man who has an insane desire to get within the clutches of the law.

¶ *The Jones Speedometer* has that peculiar influence over the speeding motorist—if he is beyond the limit—there is that "arrow"—a constant reminder. It persuades him to go slower. Thus it accomplishes a great service.

¶ And to each user of The Jones Speedometer we present our brass Protection Tag which warns the officer of the law, not to arrest on guess work.

DETROIT ... MICH.

A Pleased Customer is the Best of Advertisements...

DR. MILTON T. WATSON
250 Woodward Ave., Detroit

August 15, 1905.

Gray Manufacturing Company,
Detroit, Michigan.

Dear Sirs—I am delighted to report my entire satisfaction with your model 16 Gray Muffler, which I am using on a 16 horse-power two-cycle engine. It completely muffles the sound, and the back pressure is less than two ounces, according to a test made yesterday.

In attempting to muffle this engine I had tried several different mufflers, none of the others being effective except those in which there was a great amount of back pressure.

Yours truly,
G. K. MILTON T. WATSON.

"TRIUMPH" GASOLENE TANK GAGE

Applicable to tanks with or without pressure to show quantity of gasolene.

SIMPLE, RELIABLE, SUPERIOR IN WORKMANSHIP

The "Triumph" Gasolene Tank Gage is part of the regular equipment of all "Pierce Great Arrow" Cars for season of 1906. The only Gage endorsed by builders of first class cars.

See that your New Car has a "Triumph" Gage

FOR SALE—Haynes-Apperson runabout, '03 model; condition perfect, including mechanism, finish and tires. Fine full leather top. A beautiful and smooth running machine. Cost originally $1,450. Will make quick cash sale for $525 f. o. b. Louisville. Kentucky Automobile Company, Louisville, Ky.

FOR IMMEDIATE SALE—1903 Winton tonneau, $750; 1905 Model F Ford, tonneau, 12 H. P., $695; 1905 Rambler surrey I, 4-inch tires, like new, $825; Model E Rambler, buggy top, $225; 2—1903 Elmores, double cylinder, 12 H. P., tonneau, $200 and $300. Drop card for detailed description. Your opportunity to buy a good car below the market value. E. S. Youse, Reading, Pa.

FOR SALE—General runabout auto; fine condition; $400. Also fifty pounds calcium chloride in metal can for $2 with order. Reference, Dun. W. D. J. Everett, West Milton, Ohio.

FOR SALE—Haynes-Apperson, 1904, light touring car. Make offer. Bought late; used very little. Dr. Wm. M. Stith, Petersburg, Va.

WANTED—To trade best grade Story & Clark piano for runabout, Stevens or Reo preferred. O. F. Holley, Madelia, Minn.

FOR SALE—2 cy. 20 H. P. Winton, with extension cape top and glass front; an exceptional bargain. H. G. M., care MOTOR AGE.

FOR SALE—High grade 8 h. p. double opposed engine, $125. 4 h. p. Marine and Auto motors, $65. Write. A. J. Houle Co., 8. East St., Holyoke, Mass.

AUTOMOBILE SCHOOL

CHICAGO SCHOOL OF MOTORING.

The original Automobile School in Chicago. One hundred and eighty graduates the past year, to whom we refer upon request.

Automobile owners, prospective buyers and young men wanting to become expert chauffeurs will save a great deal of money and a lot of worry by studying the mechanism, care and repair of gasoline automobiles in our shop, where all parts are open so you can see how they are made and how they operate. We give thorough and practical instruction. Competent chauffeurs supplied.

CHICAGO SCHOOL OF MOTORING,
264 Michigan Ave. Phone Har. 119.

AUTOMOBILE DEALERS EVERYWHERE—We have a live proposition to offer dealers and agents in every town and city to handle our ready to deliver cape cart tops. Auto Top & Equipment Co., 1604 Broadway, New York City.

FOR SALE—8-10 passenger wagonette; sample car 1905-6 Model; steam; price and description on application. Thompson Auto Co., Olneyville Sq., Providence, R. I.

FOR SALE—1905 "Franklin" runabout in absolutely first class condition, used for demonstration only, and has had the best of care and is in every respect as good as new. R. D. Hamlen, 230 Grand Ave., Milwaukee, Wis.

TIRES.

ALL KINDS RUBBERINE FILLED are puncture proof; give twice the service, saving delays; resiliency retained; get sample and prices. Also new and second-hand tires. Automobile Palace, 152 W. Jackson Blvd., Chicago.

FOR SALE—1905 Packard Model N, in very best possible condition; fitted with $175 Cape Cart top; acetylene lamps, odometer and speedometer. Price $2,700. Have ordered new Packard. C. H. Ordway, 220 Clarendon St., Boston, Mass.

FOR SALE—Model L Rambler; has double opposed motors, 16 h. p.; looks well and is in good condition; tires almost new; sell cheap. One 1905 Model F four-cylinder, air-cooled Premier; new; never run; sell at a bargain. W. E. Rudy, Lima, Ohio.

FOR SALE—Rambler runabout, in first class condition, $250; must sell. Chas. Newcomb, Huntington, Ind.

FOR SALE—One Olds runabout, one four-cylinder, 20 H. P. gasoline car; eight steam cars, including runabouts and touring cars; also steam delivery wagons; all in first-class running order. Write for particulars if interested. K. A. Grout, Orange, Mass.

VOL. VIII NO. 18 . CHICAGO, NOVEMBER 2, 1905 $2.00 Per Year

NEW ORLEANS MOTORIST'S PARADISE

BAYOU ST. JOHN, ON ROAD TO SPANISH FORT

NEW ORLEANS, La., Oct. 30.—This city and the pine lands and gulf coast about it is now the center, not only of a teeming commercial life and prosperity, but also of attraction for travelers who seek warmer climes and scenes of historic and natural beauty and interest. No one element is contributing to the latter development more than the wonderful opportunities offered here for the automobilist. These opportunities have not been taken advantage of as yet to any considerable extent, as automobiling here is in its infancy. Three years ago there were just three automobiles in New Orleans. Now there are hundreds, with purchasers in sight for the immediate future that will bring the total near 1,000 very soon. In the past summer 30 miles of macadamized or asphalt pavements have been put down, and 60 miles more is contracted for. A great connecting speedway and boulevard is proposed to connect the two immense if partially unimproved park areas of the city—City park and Audubon park. Another improved road is proposed connecting the center of the city with the old shell roads leading to the lower river coast. Yet another shell road is talked of, leading out of the city to a ferry across the Rigolets, where the British fleet forced its way against a small detachment of Americans in flatboats in 1815, and thence to the Riviera of America—the Mississippi gulf coast. An automobile club has recently been organized, with Charles U. Kennedy, the pioneer automobilist of the city, as president, and a number of the most prominent men in the city active sponsors and members.

About the city, on quaint, old-time shell roads, over ancient cobble-stoned streets, or near modern, clean-swept macadam or asphalt as the case may be, are scenes and resorts full of the interest of 200 years of stormy life. French, Spanish, Americans and English people of four generations and three great races have poured out their blood about it and have left behind scenes of interest, seldom failing in the picturesque, never failing in the element of romance and often affording the opportunity for new phases of interest, fresh features unique and singular to the section and the time. Within a radius of 8 miles from the center of the city are the United States barracks and the battlefield of Chalmette; Spanish fort, the historic Bayou St. John road leading to it, and the view across Lake Pontchartrain; West End, the sum-

Digitized by Google

mer casino, and the shell road leading for 5 miles through the salt marshes and along the edge of the New Canal; City park, the dueling oaks, the golf links, and the miles of roadways under the great live oaks of what was once a great plantation; Audubon park, where the Cotton States' exposition in 1885 began the new life of the city, and where the modern Tulane university crowns the view of the broad expanse of this tract, whereon sugar cane was first grown in America.

Longer tours there are a-plenty—the 131-mile run through the picturesque sugar country up the Mississippi river to Baton Rouge; the 200 mile run around the lakes to the gulf coast, going through the live oak swamps of Louisiana, the pine dune country of Mississippi, and out on the 30-mile level sweep of the sand and shell clay roads of Mississippi. Nowhere else in America can the same weird, semi-tropical scenery, the level roads of shell and clay, through live oaks and pines, cane field and cotton fields, past old plantation homes of the ancient regime, past century-old forts of the Spanish time, past new sugar houses and humming saw mills, be seen, every one of them linked one way or another with stirring memories and dramatic episodes in the country's life.

Given evening in October, with the harvest moon in the first quarter, the wind coming in from the far-off gulf, the city just beginning to wake up from the long summer siesta, the lights and crowds in Canal street, dinner over, and the throngs of the theaters left behind for a breath of fresh air and a glimpse of scenes where sky-scrapers and electric lights may be forgotten and you have your inspiration. A car taken from the private garage, or one of those for the public that are now being established through the city, gives you the transportation. The party? Well, just the party any one who visits New Orleans or who lives there would choose to aid him in enjoying a southern autumn moonlight night with a setting of scintillant water, breeze-stirred oaks, historic tropic scenery, and flavor of romance not toon strong for twentieth century money-making or money-spending folk. The Bayou St. John highway to Spanish Fort is the route chosen, with a detour, making the trip a 7-mile jaunt out and 7 miles back, with time for supper overlooking Lake Pontchartrain.

Dueling Oaks and Tomb in City Park, New Orleans

First it is down into Canal street, dodging among the cars and the crowds, thence across the great thoroughfare and into the old French quarter. Seventy-five years ago a certain grand dame of the quarter was mobbed for inhuman cruelty to her slaves and was forced to flee from her home on Royal street, by carriage out to Spanish Fort, where she took a schooner for Mobile. The tourist should follow her route, for she went what was then and is now the most picturesque way. One change should be made. Chartres street, better paved, leads from Canal down before the Cabildo and the Cathedral St. Louis. Five minutes from Canal street, and the moonlight on the century-old buildings, with their quaint Spanish architecture, comes into view. About the square before the old buildings, a tall hand-wrought iron fence encloses the palms and shrubs that soften the one-time paved surface of the old Plac d'Armes. On either side, leading toward the river, are the Pontalba buildings, once aristocratic apartments where the elite of the city had their homes—now deserted save by the poorer peoples who have monopolized the pleasantest location and the most picturesque spot in all historic old New Orleans.

Spanish Fort, Looking on Lake Pontchartrain

Down Chartres street to Hospital street the car goes out Hospital street across Circus street to the Bayou road, out the Bayou road, to Bayou St. John. This takes the party through 3 miles of the old city, with the spaces widening at the end until old-time plantation homes occupy great squares of oaks and palms. Down Bayou St. John, under half speed, past boat-houses, more plantation homes, and then into the oak and cypress swamp, with the bayou on the one hand, and the fire-fly-studded, salt marsh on the other. The road is shell, over 100 years old, solid with a solidity that the winter rains can never feaze. Now and then some fellow-tourist dashes by, coming in from the lake. Here and there, like a ghost of the moonlight night, a lugger, with half-furled sails, drifts in toward the city, with singing Italians manning the sweeps, or lolling about the decks. Again a naphtha launch swishes past, turning the still water into a furrow of blazing phosphorescent brilliancy. Then the lake. The lights gleam from casinos and restaurants overlooking the water. Gaunt, weather-beaten oaks

Digitized by Google

stand out above the little islet where in ancient days the Spanish sentinels kept watch and ward against the buccaneers that once ventured into Lake Pontchartrain in search of plunder.

Luncheon follows, or supper, or dinner, as you may call it, with gumbo, bisque, croakers or sheepshead or flounders, or crabs or oysters, egg—cornbread, or dainty French rolls, washed down with claret or Moselle, or Rhine wine—with coffee and cigars or cigarettes afterward to the music of the water against the piers or the band across the plaza, while the moon sinks to rest out across the lake, where the Barataria skirted the inner shore to escape the American cruisers sent to capture them. Later, the ride back to the city, through the darkening night, and the silence, with the swamp noises emphasizing the silence, strange and mysterious here within 20 minutes of a bustling, modern city.

To West End is a trip like unto that just described that may be taken. Again there would be the shell road, the lake view and the rest at the further end, and the ride along the canal, with luggers and schooners and tug boats in greater number to break the monotony of the way. A morning jaunt popular with the amateurs of the city, takes in a circuit of the parks of New Orleans—down from Canal street to the old French market, where a typical New Orleans meal, or breakfast at Begue's may be had; thence to Esplanade avenue, along that thoroughfare, past miles of houses of the ante-bellum French period, across Bayou St. John, and out the Park road, through City park, by the Country club, and the Panama race course; around by the cemeteries, where unique and beautiful Metarie, most solemnly artistic of any similar place in the south, makes the onlooker forget death in the magic of the fine surroundings.

From City park, the way may be taken around the proposed route of the new connecting roadway. Here the improvements are lacking, but the way is not rough enough to materially interfere with the comfort of the automobilists on their pleasure-seeking trip. Through open country the way goes, where building lots are advertised for sale and homestead associations are opening up new streets and avenues for the rush of population that every modern Orleanian believes is sure to come in the immediate future. Into Carrollton avenue, once the chief thoroughfare of the county site of Jefferson parish, miles distant from New Orleans, now merely a continuation of St. Charles avenue; past the front of Tulane university and into Audubon park. Fifteen miles of good shell and gravel roadway leads through what was the first sugar plantation in America, and what was the site of the famous Cotton States' exposition of 1885. Here is the government and the state experiment station, Horticultural hall, the Audubon oaks, and a cool and breezy safe where luncheon may be had before the 5-mile spin down St. Charles avenue to the hotels and the business center of the city, where the picturesque trip ends.

Yet another tour for an afternoon, a morning, or an entire day, extends the full length of the French quarter, down through the German market gardens, and into the old plantation district yet remaining below the city in St. Bernard Parish. Jackson barracks, named for Old Hickory, and built just after the war of 1812 on the site of a fort that dated back to Spanish times, is a scene of interest 6 miles down the river. There P. T. Beauregard, the hero of Louisiana during the civil war, worked as a lieutenant with George B. McClellan, drawing plans for the New Orleans custom house before either became prominent. U. S. Grant was on duty there as lieutenant in charge of the commissary department. Robert E. Lee was subaltern there just prior to the Mexican war. Gen. Miles was stationed there for a while, in the early '70s. The old brick gateway, built over 100 years ago, still holds the guard-room, and the big iron gates still swing on the hinges that gave way for Gayoso, Claiborne, Jackson, Lee, Grant, Miles and Beauregard.

Below the barracks a great railroad has purchased a vast area and is turning old-time plantations, with stately homes and beautiful groves, into a wilderness of tracks and switches, wharves, warehouses, and factories. Before this invasion there was a government shell road from the barracks down to Chalmette. Now the railroad is building another shell road behind its reservation, and then back to the river front, and thence down to the monument and the cemetery. The river road goes on down, past other plantations, scenes full of historic interest and replete with natural beauty, to Lake Borgne canal, where dinner may be had, and the return trip begun. It's well worth the while.

CHARTRES STREET — HISTORIC PART OF — OLD PORTION OF NEW ORLEANS

TRIMS ORMOND-DAYTONA CARD

Senator Morgan Eliminates Useless Events and Makes His Feature a 2-Mile-a-Minute Race—Seventeen Contests, Fourteen of Them Championships—Five Days' Sport

New York, Oct. 27—The program for the annual Florida beach meet, which will take place on the Ormond-Daytona beach January 23-30, 1906, has been determined upon and was announced today. In making up the list of events Senator Morgan, on behalf of the Florida East Coast Automobile Association, called in as advisers men connected more or less prominently with the American Automobile Association, the National Association of Automobile Manufacturers, the Automobile Club of America and the trade and daily press. The result of their conferences is a program in which there is no discrimination against any weight or power and each class is given an equal number of events to which it is eligible. No distinctive events, however, have been provided for lightweight racing cars at present and will not be unless there be a demand for them from makers and assurance be given of a sufficient number of entries to insure adequate competition.

The theory followed in arranging the card was that the annual meet on the beach is in the strictest sense a high-speed carnival and accordingly a tournament primarily for racing cars. The experience of the past has been that entries outside of cars practically of the racing class have been insignificant in numbers and importance. It has also proved that the 5 days available for racing, limited as they are by tide conditions, permit little time for the settlement of the relative superiority at adequately varied distances of other than the racing machines and allow practically no opportunity for stock car demonstration. Then, again, last year's sad experience and futile attempt to run off a too lengthy program in the scheduled 5 days, which resulted in a lap-over of two days into the following week, and other schedule miscarriages too painful to recall, demonstrated the necessity of a very considerable cutting down of the number of events. Accordingly the racing card has been shortened from thirty to seventeen competitive events, not including the record trials for all classes at 1 mile and 1 kilometer.

Of these seventeen events, fourteen are open championships, the other three being an American car championship, a price handicap for American stock cars and an open handicap. Four classes of racing cars are recognized by the program—middle weight gasoline, heavy weight gasoline, middle weight steam and heavy weight steam. Each gasoline class has two exclusive championships, a weight championship open also to steam and five free-for-all championships, to which it is eligible. There are two championships for steam vehicles irrespective of weight, a weight championship open also to gasoline, and five free-for-all championships. To these competitions are to be added the class record trials at 1 kilometer and 1 mile. Thus summarized the program in detail for the southern affair follows:

One-mile middleweight championship, gasoline.
One-mile heavyweight championship, gasoline.
One-mile championship, steam.
One-mile world's championship free-for-all for Dewar cup.
One-kilometer record trials for each weight and power class.
One-mile record trials for each weight and power class.
Two-mile-a-minute record free-for-all. The winner must equal or exceed 120 miles an hour.
Five-mile middleweight championship, gasoline.
Five-mile heavyweight championship, gasoline.
Five-mile championship, steam.
Five-mile free-for-all championship.
Ten-mile middleweight championship, all powers.
Ten-mile heavyweight championship, all powers.
Ten-mile free-for-all championship.
Ten-mile handicap, open to contestants who start in previous events.
Fifteen-mile free-for-all championship.
Fifteen-mile price handicap for American touring cars fully equipped.
Thirty-mile free-for-all championship for American-built cars.
One-hundred-mile free-for-all championship.

The question of the admission of so-called freak racing machines, which the foreigners assert is largely responsible for their failure to enter more generally in the annual straightaway tournament, was easily and logically answered by the announcement that the definition of a legitimate motor car adopted by the A. A. A., under whose rules the races will be run, would be followed as fixing the standard of eligibility. The rule in question, which is clause 19 of the A. A. A. racing rules, is as follows:

An automobile, motor car, or car within the meaning of these rules, is a four-wheeled track or road vehicle propelled by self-contained mechanical means, and provided with suitable brakes, a differential gear or its equivalent, and a reverse gear.

Under the rules the weight classification, which follows the international classification, is as follows: Lightweight, 551 pounds to 881 pounds; middleweight, 882 pounds to 1,432 pounds; and heavyweight, 1,433 pounds to 2,204 pounds.

Each car will be confined to its own weight class in all events classified by weight in accordance with a ruling of the A. A. A. racing board made on May 4, 1905, which decided "that cars be limited strictly to their own weight classes, since all cars are eligible in free-for-alls." This means the middleweight cars cannot compete in heavyweight classes, nor is any car over 2,204 pounds weight eligible in any class.

So much for eligibility. It would seem that the limiting of cars to the international weight standard and to the form of construction outlined in the A. A. A. rule on the question was a reasonable and sufficient answer to the freak complaints at former meets and would hold down the competitors to as reasonable and logical a restriction as is possible in a competition of cars which are essentially speed machines built for the world's greatest speed tournament.

A new event—the 2-mile-a-minute free-for-all record trial—is the creation of Morgan's inventive genius. It is a veritable inspiration and an idea calculated to keep the Ormond-Daytona meet abreast of the speed advancement of the automobile. A mile a minute now belongs to the remote past and is only fit for a stock car standard.

In 1905 W. K. Vanderbilt, Jr.'s, mile of the year before on the Florida course was cut by Arthur MacDonald from 39 to 34⅘ seconds, not to take into consideration the 32⅘ seconds by Henry L. Bowden in his overweight, double engine freak. Cars far faster than these have since been built and are building, which will be on hand next January for a further assault on the figure that is emblazoned on the front of the clubhouse at Daytona, and are sure to bring the record below the half minute. In view of this Morgan conceived the 2-mile-a-minute race. It will be run in a series of time trials. The time specified must be made to entitle the victor to the novel trophy and ceremonial of conquest the senator has in mind. In the event of its attainment by more than one competitor the prize will of course go to the one who makes the biggest cut under the 120-mile-an-hour rate.

The prize list will be exceptional in character and will contain many trophies of great value. Undoubtedly the Minneapolis cup, donated by the Minneapolis Automobile Club, of which Asa Paine, the new president of the F. E. C. A. A., is a member, is probably the most magnificent. Motor racing enthusiasts who, as last year, may desire to be represented in the Florida prize list, can communicate with the management. Such prizes will be allotted to the championship races scheduled above.

In order to be eligible for the time trials cars will be required to compete in the regular competitive events in which they are entered. No car will be accepted for the touring car event unless fully described in the catalogue of the maker issued not later than 30 days before the closing of entries. All contestants will be subject to weight examination before and after competing.

The entrance fee for each event is $20, with the exception of the Dewar trophy contest, which is fixed by its deed of gift at $50. In some of the events it is probable that the heats will be arranged according to the nationality of the cars. Applications for entry blanks should be addressed to W. J. Morgan, 116 Nassau street, New York city, and from the same source any additional information may be obtained.

THOMAS PLANS PARIS TRIP

Buffalo, N. Y., Oct. 30—E. R. Thomas, maker of the Thomas Flyer, is completing arrangements for an excursion to the French automobile salon, which opens at Paris December 8. Reduced rates have been secured from steamship companies, railroads and Paris hotels, and altogether it is estimated that the cost of the trip will not exceed $225. A general invitation has been extended by Mr. Thomas to all those who propose to buy automobiles during the coming year and to those who are interested in any way in the trade of automobiles in general. Arrangements are now being completed for incidental trips to a number of the plants in France.

CADILLAC IN MERGER

Detroit Automobile-making Concern Consolidates with Leland & Faulconer Mfg. Co.

Detroit, Mich., Oct. 30—Announcement is made of the consolidation of the Cadillac Automobile Co. with the Leland & Faulconer Mfg. Co. under the tentative name of the Cadillac Motor Car Co., with a capital stock of $1,500,000. The objects are to manufacture, buy and sell cars, carriages, wagons, boats and vehicles of all kinds. None of the capital stock is paid in cash. The total net assets of the Cadillac Automobile Co. are given as $1,000,000, of which $200,000 is business and good-will. Buildings and land at Cass and Amsterdam avenues are valued at $418,118.26; cash, $39,416.81; merchandise—finished product and raw material—$358,733.21; machinery, tools, patterns, models, fixtures, supplies, etc., making up the total. The Leland & Faulconer Mfg. Co. put in: Cash, $123,249.34; outstanding accounts, $40,349.87; machinery and foundry equipment, $104,059.34; merchandise and supplies, $93,866.15; business and good will, $75,000, with indebtedness $31,000, making the total net assets $500,000. The two concerns have been very closely allied in the past, the Leland & Faulconer company making the engines and other parts for the Cadillac company. The stock has been to a great extent in the same hands, and a correlation has existed among the officers of the two concerns.

"The business of both concerns has shown a remarkable growth," says Henry M. Leland. "While the original companies were organized with a capital stock of $300,000 and $175,000 respectively, I can say that every dollar of the present capitalization is represented by something tangible. The Cadillac Automobile Co. did a larger business last year than any other automobile company in the world, its output being 4,000 machines. We do not believe in declaring dividends before they are made or counting our chickens before they are hatched; but we think we are safe in expecting a still larger business next year."

In filing articles of association, Messrs. Black, Bowen and Leland acted as trustees for ten stockholders, the others being: A. E. F. White, William H. Murphy, William E. Metzger, Wilfred C. Leland, Everett Leonard, Harry Pettee and A. C. Leonard, all of this city.

At a meeting at the Cadillac Automobile Co.'s office, Lem W. Bowen, A. E. F. White, Clarence A. Black, William H. Murphy, Henry M. Leland, William E. Metzger and Wilfred C. Leland were elected directors.

MILLIONS FOR GOOD ROADS

New York, Oct. 29—A constitutional amendment providing for the expenditure of $50,000,000 in New York state for the improvement of the highway is to be voted upon at the election next week. A. R. Shattuck, chairman of the good roads committee of the A. C. A., has sent out a circular letter to all New York motorists urging that they vote and work for the passage of the amendment.

Mr. Shattuck, who has labored enthusiastically for better highways, points to the fact that if the amendment is carried New York state will spend $50,000,000 on good roads in the next 10 years, the expense of which under the bond issue will be divided into 50 per cent on the state, 35 per cent on the county and 15 per cent on the town in the form of annual tax levies of $400 for each mile, being the interest at 5 per cent on the bond issued for a mile of roadway costing $8,000. At the request of the executive committee of the supervisors' highway convention Mr. Shattuck requests motorists to contribute $10 each to carry on this campaign. The money can be sent to him in care of the Automobile Club of America. Most important of all, Mr. Shattuck wishes motorists to vote for the amendment on election day and to make a canvass among their friends with this object in view. By state aid New York has built and has under contract 700 miles of state roads and has appropriated, all told, $3,223,265, but the state finances are such that this year it could appropriate only $100,000. In 1903 a constitutional amendment was passed by the legislature permitting the state to bond itself for $5,000,000 a year for 10 years. This amendment, as required by law, was passed again by the legislature in 1905, and will be submitted to the vote of the people at the next election, on November 7. If the amendment is carried by the popular vote the state will build between 600 and 700 miles of state roads a year, and in 10 years, instead of its roads being a disgrace to civilization, as at present, New York will have 7,000 miles of fine roadway connecting the principal cities of the state, which will make motoring almost universal throughout the state.

FORTUNE IN NEW YORK'S ROW

New York, Oct. 30—The expenditure of millions of dollars is under way already or planned in the immediate future for garages along New York's new automobile row, which will extend along Broadway for a mile from Forty-fifth to Sixty-fourth street and include locations on the side streets near to or adjoining the main thoroughfare. Already, in addition to the great garage just completed by Smith & Mabley, the Pope, Winton, Thomas and Packard cars are housed in spacious and elegant headquarters. The Ford Motor Co. is remodeling a big Broadway stable and E. B. Gallaher, agent for the Richard-Brasier and Cleveland, another one on Fifty-eighth street just west of Broadway for garage purposes. The new half-million-dollar A. C. A. club house on Fifty-fourth street will have an enormous garage for members. The Auto Import Co. garage at Broadway and Fifty-seventh street, which has been leased by the American Locomotive Co., and the garage building for the Lozier branch at Broadway and Fifty-fifth street will both be occupied by show time. Adjoining the Smith & Mabley plant on the corner of Fifty-sixth street is another building for rent for a garage. Of the proposed new Thomas garage at Sixty-third street and Broadway MOTOR AGE told last week.

KEEP TAB ON AMERICA

Britons Watch Vanderbilt Race Results and Are Not Alarmed By United States' Showing

London, Oct. 21—The Vanderbilt cup race, while not evoking any particular enthusiasm on this side, was keenly watched by British motor manufacturers in order to learn how far American builders have progressed. They profess to be satisfied that American development and progress has been only what was to be expected from increased experience and does not at the moment, disclose any potentialities such as would warrant any international trade developments from your side. Lancia is very sincerely sympathized with on his renewed ill luck, but his performance simply goes to show that the 1905 Bennett form was of a very high racing order, as a reference to his driving in comparison with that of Thery, Caillon and others will indicate. The protests of Hemery and Heath, which were later withdrawn, are not regarded as a very sportsmanlike proceeding, but the least we say on that subject the better, for our international contests on this side have not been distinguished by sportsmanship. It is expected that the protests were based on the supposition that Darracq's tires were English-made Dunlops and that the Darracq radiator was made by Megerisy of Geneva, who supplies quite a large proportion of the French trade with the honeycomb form of radiator, just as Lemoine supplies Germany and England with axles. But the Dunlop tires used by Hemery were made in France by the French branch of the Dunlop company—the high import duty necessitates that—and the writer is told by the Darracq representative here that the radiator is one specially constructed in France to meet the Bennett regulations. But the protest against Heath's Panhard puzzles and amuses, for it is well known that nothing not French is incorporated in any Panhard sold in France—not to speak of an international racing car, subject to such conditions as control the Vanderbilt race.

CLOSES DE DIETRICH BRANCH

New York, Oct. 30—"De Dietrich, American Branch," is no more. Baron Adrien de Turckheim, on his visit to this country for the Vanderbilt cup race, decided to close the branch. The American de Dietrich agency has been taken by a syndicate headed by Walter Allen, of the former firm of Allen, Hall & Co., which last year imported the Mercedes cars. Incidental to the breaking up of the branch there was a receiver's auction sale, at which fifteen cars and a motor boat were sold at figures so great as bargains as to be the talk of the town. The aggregate was $38,000. Mr. Allen secured the 90-horsepower racer which won the Vanderbilt 100-mile race at Ormond and scored world's records in Cuba and was driven by Gabriel in last year's race on Long Island for $1,950. The Pullman car, for which $16,000 was asked last year by the de Dietrich people sold for $3,500.

NEW YORK ECONOMY TEST IN FULL SWING

On the Road to the Manhattanville Ferry—From Staten Island to the Jersey Shore

PHILADELPHIA, Pa., Oct. 30—Eight of the nine cars which started from the Smith & Mabley garage at Broadway and Fifty-sixth street, New York, between 8:38 and 9:07 o'clock this morning, on the economy test of the New York Motor Club, completed the run of 102 miles to this city in good shape and time this afternoon. The only car to fall by the wayside was a Compound, No. 5, which stripped the tooth of a gear and was forced to drop out at New Brunswick.

At the present writing there are but few results to state from an economical standpoint beyond the statement that the mechanical repairs were trifling in the aggregate; in fact, but a few pennies over $2 for the entire octet. Of actual gasoline consumption nothing can be told until the tanks are filled tomorrow morning and the figures are given out at the meeting of the officials on the arrival of the cars in New York tomorrow evening. There were gasoline charges against three cars, which took on fuel en route by way of precaution; but as this will count in their favor when tomorrow's tank filling comes their averages suffer but temporarily.

There was no attempt whatever today at speeding, all being satisfied to keep well within legal limits. Besides, there were three ferries crossed and the catching of the hour-apart boats at Tottenville was largely a matter of luck. Still, to satisfy curiosity, the elapsed time of the cars, including the three ferriages, is quoted in the following details of the contesting cars.

No. 1—Frayer-Miller, 24-horsepower, side entrance tonneau, entered by Oscar Lear Auto Co., Columbus, O.; price, $2,500; Continental tires; five passengers; Lee Frayer, driver. Elapsed time, 8 hours 39 minutes.

No. 2—Marmon, 20-horsepower, side entrance tonneau, entered by A. E. Schultz, New York; price, $2,500; Diamond tires; four passengers; Conrad Sargenson, driver. Elapsed time, 8 hours 20 minutes.

No. 3—Reo, 16-horsepower wagonette, entered by R. M. Owen, New York; price, $1,600; Diamond tires; ten passengers; R. L. Lockwood, driver. Elapsed time, 10 hours 2 minutes.

No. 4—Reo, 8-horsepower runabout with folding detachable rear seat, entered by R. M. Owen, New York; price, $675; Diamond tires; four passengers; C. C. Singer, driver. Elapsed time, 9 hours 53 minutes.

No. 5—Compound, 12-15-horsepower, side entrance detachable tonneau, entered by E. V. Co., Middletown, Conn.; price, $1,450 with lamps; Hartford tires; five passengers; D. F. Graham, driver. Stripped gears at New Brunswick.

No. 6—Compound, 12-15-horsepower, side entrance detachable tonneau, entered by E. V. Co., Middletown, Conn.; price, $1,450 with lamps; Diamond tires; five passengers; F. C. Carter, driver. Elapsed time, 8 hours 41 minutes.

No. 7—Compound, 12-15-horsepower, side entrance detachable tonneau, entered by E. V. Co., Middletown, Conn.; price, $1,450 with lamps; Goodrich tires; four passengers; C. P. Hatch, driver. Elapsed time, 8 hours 54 minutes.

No. 8—Olds, 8-horsepower curve dash runabout, dos-a-dos, entered by Oldsmobile Co., of New York; price, $670; Diamond tires; four passengers; Freeman Monroe, driver. Elapsed time, 8 hours 32 minutes.

No. 9—Wayne, 20-horsepower, side entrance tonneau, entered by Wayne Automobile Co., Detroit, Mich.; price, $1,250; Fisk tires; five passengers; A. L. Kull, driver. Elapsed time, 7 hours 50 minutes.

The tentative record of the cars given out tonight is quoted below, though the figures mean little beyond showing the charges for mechanical repairs. The averages will all be raised by the gasoline charges, though those who took on fuel on the road will have the advantage. The record is as follows:

No. 1—Frayer-Miller. Ferries, $1.68; average per passenger, 33.6 cents.

No. 2—Marmon. Mechanical repairs, 18¾ cents; ferries, $1.55; total, $1.73¾; average, 43.4 cents.

No. 3—Reo wagonette. Gasoline, 63¾ cents; mechanical repairs, 93¾ cents; ferries, $2.86; total, $4.83½; average, 44.9 cents.

No. 4—Reo runabout. Gasoline, 25 cents; ferries, $1.55; total, $1.80; average expense for the day, 45 cents.

No. 6—Compound. Oil, 5 cents; mechanical repairs, 37½ cents; ferries, $1.70; total, $2.12½; average, 42.5 cents.

No. 7—Compound. Tire repairs, 56¼ cents; ferries, $1.55; total, $1.55.

No. 8—Olds. Gasoline, 98¾ cents; mechanical repairs, 18¾ cents; ferries, $1.60; total, $2.72½; average, 68.1 cents.

No. 9—Wayne. Oil, 60 cents; mechanical repairs, 37½ cents; ferries, $1.68; total, $2.62½; average, 52.5 cents.

Again be it understood the above report for the first day's run will be entirely amended by tomorrow's official report of gasoline consumption.

The section of the rules under which the above charges are made is as follows:

37. Observers shall report charges as follows: Hotel and general expenses, no charge; gasoline, 25 cents per gallon; lubricants, 60 cents per gallon; time of engine or general repairs, 60 cents per hour; time of tire repairs, 50 cents per hour, charges to be assessed in respect to any occupant of the car who assists or any repairman en route; punctures of inner tubes, 75 cents each; puncture of shoes, no charge; blowouts of inner tubes, 75 cents each; blowouts of shoes, no charge; time to inflate inner tubes or replace same, 50 cents per hour; new parts, catalogue price; chain repairs, 50 cents per hour and catalogue price of new links; all moneys paid for any purpose, such as legal fines, bridge tolls, ferry charges and necessary fees of all description.

A balmy Indian summer day was vouchsafed by the clerk of the weather for the run. The route was by ferry to St. George, a fine highway across to Staten Island. Splendid roads, except a bad bit

New Reo Bus in the Economy Test

Digitized by Google

of cobblestones toward the end to Camden, and ferry to the Quaker City—102 miles of road in all.

Each car carried a merry complement of passengers, out for fun. Unofficial observers on the front seat and the placards on the vehicles gave the only indication that the test was more than a mere pleasure jaunt. All hands entered into the joy of the day and trip, took things easily and did not stint the time set apart for lunch. There were four women on the run. Two of them were in the jolly party of ten Ray Owen had out in the Reo wagonette. The performance of this car was watched with interest, as it was its trial trip and the first official demonstration of a long-distance passenger bus. No attempt was made to force it. It bowled along easily at 15 miles an hour and took all the hills without trouble. A lost master link cost it 25 minutes. This was its only delay.

The cars are housed for the night in the White garage on North Broad street. The tourists are making merry at the Walton tonight, but will make an early start on the return trip tomorrow.

Three official cars, a White, a Franklin and a Maxwell, manned respectively by E. T. Fitch, the referee; F. Ed Spooner and Nathan Lazarnick, of photographic fame, accompanied the run. The details of the test were well worked and carried out. The main officials in charge were: E. T. Fitch, referee; W. J. P. Moore, chairman of the contest committee; and A. B. Tucker, secretary and general manager.

It is certain that the railroad will be beaten by the motor cars by more than one-half. The only mishap of the day befell W. H. Harrison, of the New York Tribune, who was thrown out of the Oldsmobile as it rounded a corner at New Brunswick at high speed. Harrison was standing on the dos-a-dos platform as the turn was made. He was cut on the head and hands and otherwise bruised enough to compel his return to New York tonight, though he pluckily insisted on completing the run to Philadelphia.

SECOND DAY'S TEST

New York, Oct. 31—Special telegram—The eight cars which were survivors at Philadelphia also completed the second day's run and will start for Albany tomorrow morning. The Graham Compound was still missing, and thereby hangs a tale of heroic perseverance. It stripped a gear at 1:18 o'clock yesterday afternoon at New Brunswick. Graham had no idea of quitting, so wired the Middletown factory to ship a new transmission to New York. It was met at the Grand Central depot and hurried by automobile to the Pennsylvania depot, and thence by train to New Brunswick. By 9 o'clock the car was ready for a fresh start for Philadelphia. Trenton was made all right, but 12 miles east of Burlington the car ran into a ditch in the darkness and was wrecked. At 2 o'clock a belated trolley car came up and was boarded for Burlington, where the night was passed. Bright and early in the morning the heroic crew returned to the wreck, leaving the observer behind them, to be phoned for later. It was the intention of the relief party to get the car back to New York, repair it and make still another start in the test. Up to 10 o'clock tonight no word had been received from the wrecking crew.

Despite three ferries to be crossed, the finish of the first six cars was phenomenally close and as follows in elapsed time: No. 6 in 8:18, No. 4 in 8:19, No. 9 in 8:22, No. 2 in 8:23, No. 3 in 8:24, No. 1 in 8:31, No. 8 in 9:33 and No. 7 in 10:49.

Owing to the tanks not being filled until the following morning, only the gasoline record of the day before is available. It is now possible to correct the imperfect results of Monday, sent MOTOR AGE last night. The following is the record of all of the survivors except No. 1, of which later.

No. 2—Gasoline, $2; oil, 20 cents; total fuel, $2.20; average, 54 cents; total all expenses, $4.96; average, $1.24.

No. 3—Gasoline, $2.18¾; oil, 25 cents; total fuel, $2.43¾; average, 24 7-10 cents; total expenses, $5.58; average, 55 8-10 cents.

No. 4—Gasoline, $1; oil, 7½ cents; total fuel, $1.07½; average, 26 9-10 cents; total expenses, $2.62½; average, 65 6-10 cents.

No. 6—Gasoline, $1.50; oil, 85 cents; total fuel, $2.35; average, 45 7-10 cents; total expenses, $4.42½; average, 88 1-10 cents.

No. 7—Gasoline, $1.53; oil, $1.07; total fuel, $2.60; average, 65 cents; total expenses, $5.20; average, $1.17 8-10.

No. 8—Gasoline, $1.65⅝; oil, 3¾ cents; total fuel, $1.69; average, 42 2-10 cents; total expenses, $4.38; average, $1.09 2-10.

No. 9—Gasoline, $2; oil, 60 cents; total fuel, $2.60; average, 52 4-10 cents; total expense, $4.52½; average, 70 5-10 cents.

No. 1, the Frayer-Miller, did not require any further supply of gasoline or oil for its tanks, and no record can be had of its fuel consumption until a filling is asked. It will be seen by the above report that of the cars recorded the Reo runabout and wagonette are far ahead of their rivals in average cost of fuel and total expenses per passenger. Through an error in the figures given out yesterday 65 cents was wrongly charged against the wagonette. This has been deducted in the above record by the officials in charge.

Of today's expenses the only figures attainable for reasons already stated are those for ferry charges and mechanical and tire repairs. The Marmon was charged with 18¾ cents for mechanical and $1.12½ for tire repairs. Compound No. 7 had to put in a new shoe at a cost of $28.50.

The star performance of the day was the run of the 16-horsepower Reo wagonette with ten passengers, weighing 1,500 pounds in all, from Trenton to Perth Amboy, a distance of 43½ miles without a stop, in 2 hours 10 minutes, an average of 20 miles an hour. The 8-horsepower Reo runabout accompanied it on the run and scored the same time.

The only mishap of today's run was the collision of the Wayne with some sewer piping in avoiding a collision with a four-mule team, whereby two spokes of a rear wheel were broken. The car succeeded in completing the run with its crippled wheels. Referee Fitch ruled that a new wheel could be supplied without any penalty to the Wayne on the ground that it was an unavoidable accident. Tomorrow's run goes to Albany by way of Yonkers, Tarrytown, Poughkeepsie, Hudson and Greenbush, returning by the same route. Then the cars journey to Southampton by way of East Thirty-fourth street ferry, Jamaica, Valley Stream, Rockville Center, Freeport, Massapequa, returning by way of North Shore. In this test great stress is laid on rule 44 which compels drivers to pay heed to the rules of the road. So far no one has violated any of these, everyone being content to follow a sane pace. The rule in question says: "Drivers mut be familiar with the rules of the road, and the current automobile laws of the states of New Jersey, New York and Pennsylvania. Each must be familiar with the speed limit regulations. Fines after arrest for breaking speed limit regulations shall be charged against the car. The act of fining is considered to establish blame on the part of the driver so far as this test is concerned."

THE AUTOMOBILE AND ACCIDENTS

IT HAS been the custom of municipalities for the past several years to keep a fairly accurate record of the accidents which occur upon city streets, charging each particular class of vehicles with the accidents for which it is responsible. The published reports for the past few years in this country and the past decade or so abroad fail by far to give to the motorphobist the least particle of consolation; in fact, the motor car can now be classed as a safe vehicle, all things considered.

The most accurate figures come from London, where vans, hackney carriages and the like are licensed and numbered the same as are motor cars. In the past 9 months ending with September the number of accidents charged to means of transportation other than motor cars operating on the city's streets was enormous, as the figures recently published show:

	Accidents	Injuries	Killed
Tram cars—			
July, Aug., Sept., 1905...	250	102	39
Six months previous.....	459	239	84
Total	709	341	123
Horse-drawn vehicles—			
July, Aug., Sept., 1905...	1,101	467	102
Three yrs. 1 mo. previous.	11,753	8,205	1,152
Total	12,854	8,672	1,254

The showing for the 9 years from 1896 to 1904, inclusive, was even worse for the horse-drawn vehicles:

Automobiles, average number accidents per annum	142
Horse-drawn vehicles, average per annum	6,667

With the number of automobiles constantly on the increase it is not strange that there should have been some change in proportion, for the use of horse-drawn vehicles fell off somewhat during the past 4 years, while the number of automobiles found to be in use on the streets increased largely:

Automobiles, average number accidents, past 4 years.....	294
Horse-drawn vehicles, average per year, past 4 years.....	6,361

As a matter of fact, however, these figures are not of as much value as others, for the number of horse-drawn vehicles is not accurately known, except so far as public conveyances are concerned. Even here the automobile makes a remarkable showing and puts to shame the twaddle pumped into the public by the anti-motoring press. The figures following are for the year 1904. That year there were in London 11,057 hackney carriages for hire, and these were responsible for 1,286 personal injury accidents, an average of one accident to every nine hackneys. During the same time there were registered 8,380 automobiles, which were held responsible for 557 personal injury accidents, or an average of but one accident to each fifteen automobiles. In Birmingham during 1904 there were fifty-four accidents chargeable to automobiles and 746 accidents chargeable to horse-drawn vehicles.

Now comes Chicago, the hotbed of strikes, motorphobia, yellow press and other unpleasant things. The published reports are by no means comforting to the motorphobists. For the purpose of placing the motor car in as unenviable a light as possible the classification relating to horse-drawn vehicles has been split up to make it appear that the automobile has done its share of destruction. As a matter of fact, however, the automobile was responsible for only 158 accidents of all sorts during 1904, and only one person was killed. On the other hand, horse-drawn vehicles were responsible for 621 accidents, and in this number is included thirty-seven deaths. Still worse is the work of destruction of the street cars, which caused eighty-nine deaths and a total of 2,014 accidents. The full table follows:

	Killed	Injured	Total
Horse-drawn vehicles...	37	584	621
Bicycles	1	24	25
Street cars.....	89	1,925	2,014
Motor cars.....	1	73	74

In the name of all that is decent, all that is reasonable, can any municipal officer of any community grin with satisfaction at his warfare on automobiles and automobilists when perusing these figures?

The French people have been through this mill; they have fought it all out, and the authorities there can give the American officials so much advice on how to handle street traffic that the American could not help feeling that he had a good deal to learn. In Paris speed laws are practically unknown, but the individual is held responsible for any damage he does, as young Eliot F. Shepard, an American, found when he was sentenced to pay a heavy fine and spend several months in jail as a result of killing a person. As a correspondent of MOTOR AGE points out, no speed laws will prevent accidents. To quote from his letter:

> A safe driver needs no law; a reckless driver defies every limit. A man may run his motor car at 40 miles an hour and yet be careful and safe; again, he may be inexcusably careless, even reckless, at a speed of not more than 3 miles an hour. It is all a question of care, of place and of circumstances, and not a question of speed limit. Take away the fun-loving fiends, abolish the technical, definite speed limit, and make every operator of an automobile and every driver of a team responsible, under severest penalties of imprisonment, according to the degree of the offense, for every accident or injury he may cause.

The entire story is told in the few lines above; the remedy for the speed evil is given, and it is up to the authorities to pass laws that will govern the situation the way it ought to be governed. The whole trouble is that graft is so imbedded in all municipal fabrics that laws are enforced that suit a purpose best, regardless of justice and the rights of all classes.

The most damnable and most dangerous monster is the trolley car, running as it does anywhere from 10 to 30 miles an hour in crowded streets and past intersecting thoroughfares with little or no warning of its thundering approach until it has committed murder.

There has been a mass of jumbled laws passed in various sections of the country. Some are reasonable—95 per cent of them are unreasonable. Most of them are useless or inconsistent. The laws that will fit one city will fit another; that which will fit one rural section will fit another; that which is reasonable to one motorist will be reasonable to all; there are no varying conditions worth mentioning.

That is what must come in the end. The mass of jumble now called laws must go if the motor car and its driver is to be held to account for his recklessness or his carelessness.

CHANGES NECESSARY IN ROAD RACING

ROAD RACING in America is to continue; that has been settled. It was not so settled the day before the Vanderbilt cup race was run. The catastrophies which resulted in the pursuit of track racing had put a damper on racing in all forms and it only needed a little wind to kindle the spark into a blaze. Had there been a single fatality among the contestants in the Vanderbilt cup race it would have ended such contests. Happily the race was completed without such result. There were times, however, when it seemed as if it would be impossible to avoid killing a score or more of people.

If the race is to be continued it will be found that the entire scheme must be gone over and beneficial changes must be made. With the increasing interest in automobiles and such affairs as the Vanderbilt cup race, another year will possibly see a quarter of a milion people on the course. Some means must be taken whereby such an immense throng must be kept absolutely away from the danger line, and the danger line extends on either side of the road for a distance of several rods.

If the race is to continue there must be material changes in the rules, else the manufacturers and other owners of racing cars will not have the heart to go into the contest with a considerable chance of having their entries thrown out after having demonstrated the ability of their cars to go the distance at a reasonable speed. There should be an early settlement of this particular point, inasmuch as it takes a long time to construct racing cars fit to represent this country against foreign productions. The question of guarding the course can be left open for some considerable length of time.

Traveling private automobile shows ought to prove immensely popular—with the railroad companies.

There is one thing about an economy test that is commendable—the participants spare no expense to make a good showing.

The beautiful part of getting sample cars out early and selling them is that the attendants at the shows will be enabled to have a good time.

Boosting foreign and knocking home-made automobiles and automobiling is the sort of consistency with which the average American daily paper is blessed.

Notwithstanding horse shows, football games and other seasonable affairs, the automobile by no means has been forgotten—by the police and dinky administrators of justice and injustice.

Pretty nearly all the old cycling stunts—including the dead broke tour—have been performed by motorists. The man who will reach the north pole in a motor car will find himself amply rewarded with glory, however.

It's a pretty tough rap at home talent for the prince of Wales to select an American for chauffeur for his trip to India, and this on top of the fact that King Edward's chauffeur is an American. But the prince did select an English car.

If Czar Nicholas II should make his escape from Russia in an automobile it would not be among the impossibilities. Such a trick would be a good boost for automobiling, and, by the way, this is a hint for some enterprising manufacturer to do an advertising stunt.

By the time Percy Megargel has completed his out-west and back-east tour he will be fitted to stand a trip to the arctic regions or to—the equator.

THE WEEK IN BRIEF

Senator Morgan makes up card for Ormond-Daytona beach meet, reducing number of events to seventeen, with fifteen of them championships; feature to be a 2-miles-a minute race.

Britons regard Vanderbilt cup race as proving that America's progress in automobile construction, while only what was to be expected, is not enough to scarce them.

Percy Megargel, transcontinental tourist, reports his arrival at Burns, Ore.; he is given scare in mountains by runaway hauling load of dynamite.

New York's constitutional amendment, which comes up at next election, provides for expenditure of $50,000,000 on good roads.

Recent additions to New York's row show that cost of Gotham's garages, when all done, will run into millions.

Cadillac Automobile Co. and Leland & Faulconer Mfg. Co. merged into Cadillac Motor Car Co.

De Dietrich's American branch is closed; valuable cars go for song at receiver's sale.

E. R. Thomas planning trip to Paris show; will make up party of Americans.

Reports from England show France is gaining foothold in United Kingdom.

It is a pretty hard slap at the horse to have automobiles line up at a horse show the way they did at the affair held last week at the Coliseum in Chicago. Likewise, this is a jolt for the motorphobist from which it will take time to recover.

Americans needn't think they're so much ahead of the world—Leipzic has already held its 1906 show.

Now that John Farson is slated for president of the American Automobile Association, red will be the prevailing color in automobile bodies and upholstery.

France may drop the road racing game, but after it has been out in the cold one short season it will be glad enough to come in and toast its shins by the fireside.

While the automobilist goes on giving figures to show that the motor car is by no means as dangerous as the horse-drawn vehicle, the police go on with their process of extracting coin from the automobilist.

State Senator McKee of New Jersey, has drafted a bill which starts out with "Any man driving an automobile in a drunken condition will be liable to summary arrest." Intoxicated cars would better steer clear of New Jersey.

Toot-Toot is the name of the official organ of the California Woman's Automobile Club and the San Francisco Motorcycle Club. To add to the excitement, it is published by the Gabriel Printing Co. The initial number is just out and it is declared that this is not the last toot, either.

The only machine that failed to finish in the German commercial trial was an old beer van, which kept up with its load until the sixth and last day. That's going some at that, for anyone who can carry a load for nearly a week, while hardly eligible for a blue ribbon, should receive favorable mention.

Last Week Chicago Held Its Annual Horse Show—The Horses Were All Inside the Coliseum, However

SCARE FOR MEGARGEL

Tourist Runs Afoul of Freighter Loaded With Dynamite—Horses Run Away

Burns, Ore., Nov. 1—Special telegram—The Reo Mountaineer pulled into this place last night, and this afternoon we head for Prineville. Burns is rather lonely, being 150 miles from a railroad. With the departure of the Reo Mountaineer from Boise City all communication from the outside world was cut off for some time, as after leaving Ontario we left the railroad and telegraph line and struck off across the mountains to this point, following the old wagon trail now used by freighters and their six, eight and ten-horse outfits.

Speaking about freighters brings back to my memory a little adventure we had with one last Sunday. We were slowly winding our way up a narrow mountain pass when we encountered a four-horse freighter coming down the steep grade. Luckily there was a little level stretch in which two teams could pass and I pulled the Reo to the side of the road—the side next to the precipice—and stopped. The freighter descended from his high seat and after looking over the situation returned to his perch and drove on toward the automobile.

Everything went well until the leaders were within a dozen feet of the silent machine, when they suddenly wheeled and, dragging the wheel horses with them, turned completely around in the narrow road. The driver, expecting his vehicle with its two tons of baled hay to upset, jumped and dropped his lines. Strange as it seemed, those four horses succeeded in turning that wagon and its load completely around in that narrow 12-foot road and commenced to run up the hill. A telephone pole, which was badly shattered in the mix-up, brought the truants to a stop and the teamster caught his horses before any damage, other than a broken whiffletree, had been done. He told us afterward that there were 100 pounds of dynamite on the wagon under the hay, and what might have happened to the Reo Mountaineer and its crew had this exploded when the wagon struck the telephone pole can only be surmised.

All easterners have read of the wild, or rather half-wild, western cattle that roam the prairies in this section. It is the custom to allow the herds to run wild all summer in the mountains and to hold a round-up in the fall. Each owner then drives the critters bearing his brand down into some valley for the winter months. Between the old toll gate and Boise, a stretch of 50 odd miles over the mountains, we ran through a drove of some 3,000 head of these wild cattle being driven in sundry small herds and bunches toward the Boise valley for the winter.

At Boise we added to our equipment. Thick sheepskin gloves, high laced waterproof shoes, heavy sweaters and heavy underclothes have been added to our wardrobe for the 700-mile drive over the Blue and Cascade mountains to Portland. Reports from all along the route say that there is from 6 inches to 2 feet of snow on the passes, and the unbanked turns—in many cases very sharp—are more or less dangerous to take with an automobile. With our equipment of tire chains, sprags, windlass and cable, Bailey won't-slip tires, etc., we feel confident that we can take the Reo anywhere horses can drag wagons, and despite the stories of impassable passes, exaggerated in many cases no doubt to frighten tourists, both Fassett and myself feel confident of getting through with our Lansing product.

The set of four original Diamond tires that brought us all the way from New York were exchanged for new ones here. This is the first time we have changed our tires on the trip, and it was done more as a precaution than because necessary. In the center of Oregon, over 100 miles from a railroad, would be a bad place to have tire trouble, so we are taking no chances. The original set of Diamonds will be returned to the Akron factory, recovered and again put on the wheels of the Reo Mountaineer ere it returns to New York city.

SAMPLE OF IDAHO MOUNTAINS

Our sand tires, used once in Wyoming and once in Idaho, will be freighted to Portland, as we will have no further use for sand tires until we get in the vicinity of San Francisco. They proved most useful, though, on the two times they were used, and it would have been impossible to have got through without their aid, especially on the 7-mile stretch of sand between Ross Forks and Blackfoot, when it was almost impossible to travel without them.—PERCY F. MEGARGEL.

SLOWS UP SPORT BOOM

Failure of Foreign Motor Boat Campaign Checks the Growth of Water Pastime

London, Oct. 21—It would really appear as though the motor boat movement has had a severe check—at least the racing section of it has. Last year France in particular effervesced over motor boat racing. Cross-channel, cross-Mediterranean, Paris-to-the-sea, and Arcachon were merely leading items in a large and eagerly filled program. On our side we had big regattas in Southampton roads, at Burnham-on-Crouch and other places, and it was confidently expected that motor

OLD MAN OF THE MOUNTAINS

boat racing would experience a big boom in 1906. But it has been anything but that. In France it has been akin to a fizzle, thanks, no doubt, to the disastrous result of the cross-Mediterranean race, which practically wiped out France's latest developments in high speed motor craft. And our own program has not been much better. Last year's excitement was too intense and feverish to last—the movement necessary to make the new boom possible, and the result has been that, with but scanty additions to marine motor racing ranks, the season has been quiet even to was overdone. But land motoring was too engrossing for those who had the money disappointment. But for the presence of the Napier boats, all built last season, very little attention would have been attracted to the movement in England, while, despite activity on the part of leading French motor makers, it has been almost moribund over there. The Paris-to-sea race, which was such a sensation in 1904, was a walkover for a comparatively small boat of no real pretensions. No French competitors to the English Napiers could be found at Arcachon, in the Harmsworth race, and at the Burnham-on-Crouch motor boat meeting, which has just wound up the British automobile club's 1905 sporting program. While there was an abundance of events spread over 3 days, competition was almost absent. Indeed the meeting was so ill supported that it had

Digitized by Google

to be postponed in order to permit the English boats racing at Arcachon to get back to swell the lists. It was well it was so, for there was little else to see in the way of sport. It is to be feared that motor-boat racing is not a popular form of sport at the moment. It is slow to watch and expensive to exploit. But then it makes more moderate demands on the enthusiast's purse and when there are not so many land distractions for the motorist it will probably have a look in. Meanwhile the pleasure side of marine motoring is going ahead, but it, too, is cramped by reason of high prices at the moment for satisfactory articles.

Over here they are keeping an eye on the healthy complexion of the sport on the other side of the pond. While America has not attempted anything in the line of international competition, she seems to have hit the right idea with her regattas and especially the long tour to the Thousand Islands, which made an impression on motor boat enthusiasts here. It was regretted that neither the Challenger nor Dixie came over to compete for the Harmsworth cup. France's case of cold feet, which marred what ought to have been a brilliant international event, and America's withdrawal, although anticipated, disappointed those who had heard so much of the speed shown by Brokaw's and Thomas's creations. Harmsworth is going to try again next year and will renew his trophy, which this season was taken by Napier in that much-to-be-regretted fluke race, and it is anticipated that during the winter months France and America will be able to compete.

Cecil Edge on Top Speed Test

EXPORT TRADE GROWING

Washington, D. C., Oct. 30—The export record is growing with every succeeding month. During September automobiles and parts to the value of $194,499 were shipped to various foreign countries, which is a big gain over the shipments for the same month of last year, when the foreign shipments were valued at $123,487. For the nine months ending with September these exports were valued at $2,235,633, as compared with a value of $1,445,986 and $1,192,829 for the corresponding periods of 1904 and 1903.

DO WELL IN ENGLAND

Season's Report Shows French Makers Have Gained Strong Footing in Kingdom

London, Oct. 21—Although we are practically within hail of the Olympia show, quite a lot of uncertainty appears to exist regarding not merely the new features to be disclosed but the very prices at which the new season's trade is to be campaigned. Bringing forward the date of the show from February to November, on top of a long-drawn-out trading season, and the uncertainty created by the Tourist trophy race and its possibilities, have caught British motor car manufacturers napping while the foreign section of exhibitors are hampered by the fact that their headquarters arrangements have all been built on the Paris show date—a fortnight later than Olympia. But such disturbances always precede a big show and always leave little or no trace when the show is held; therefore little real attention is paid to them. Everybody will probably be ready in time, for the issues are too momentous to admit of failure through mere lack of working hours. In the course of making inquiries on these matters the writer has been able to arrive at a very fair idea of the trade done in this country by the leading French houses, and as the figures will no doubt interest manufacturers on your side they are given. First of all come the Darracqs, whose total of imports runs to 971 cars in the year ending September 30 last. This is almost 50 per cent more than the Darracq trade of 1904 and the increase is probably due to having been very early in the field with stylish cars in which ample power was given at prices that looked very low until the remainder of the French makers came out with their lists. But the cars have been soundly handled and on the whole have given satisfaction. The next firm in point of numerical order is undoubtedly Panhard & Levassor, whose total cannot be given exactly, but it is in the region of 800 cars. These represent a higher aggregate value than Darracqs, as the prices are individually higher. Next come the Clement-Talbot cars, the great majority of which have been imported, despite the fact that the company has a large factory in London. Its total is about 700 cars, and it is doubtful if more than one or two really British firms have individually exceeded that total. Then De Dions weigh in with 576 cars, most of them of the single-cylinder type, and then Peugeot with 400 and Gladiator with something less, stand out clear from the remainder of the crowd. Renaults, C. G. V.s and Mors have done well, but their prices are high and quantities are in consequence restricted. As all these concerns are mapping out next year's trade in this country on more extensive lines, it needs little argument to show that the British manufacturer has a long row to hoe before he can capture the market they have secured on his doorstep. And when America joins in, as we confidently expect it to do in a few years' time—or less—things will be a trifle lively.

The De Dion cars for 1906 have not yet reached this country, but the writer is able to state that they will run into six distinct patterns, starting with an extra cheap 6-horsepower type. This, however, will not be ready before June. It will be, in common with the ordinary 6-horsepower and 8-horsepower, a single cylinder with the patent De Dion expanding clutch gear change. A 9-horsepower type will also have a single cylinder, but the gear in it, as well as in the 12 twin cylinder and 15 and 24 four-cylinder cars, will be of the sliding pinion type.

Prince of Wales' Argyll Car

Harry S. Schuyler, an American, hailing from Philadelphia, and chauffeur of Consuelo, duchess of Marlborough, while she was visiting in America, has, upon her recommendation, been selected to drive the prince and princess of Wales on their motor trip through India. The car that royalty will travel in is an Argyll of the same make as the one which won the recent Tourist trophy race on the Isle of Man. It was ordered for the prince by the Earl of Shaftesbury and will seat seven people. It is painted in cream color and upholstered in blue, with a specially designed canopy with sun blinds and windows. King Edward also has an American driver, one Staunton, who put his O. K. on the application of Schuyler.

The people are still talking of the performance of Cecil Edge, who drove his six-cylinder Napier from Brighton to Edinburgh on his top gear, the 420 miles being done in 23¼ hours.

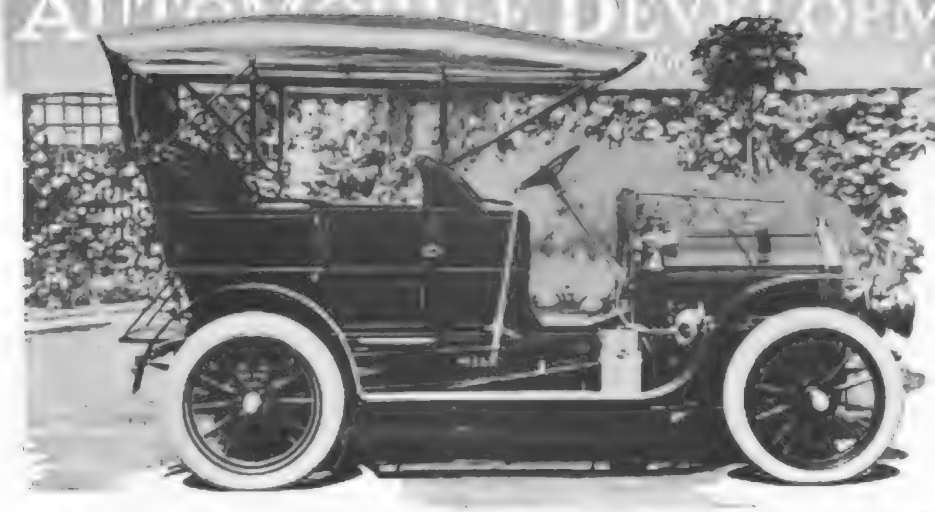
Automobile Development

The Great Arrow

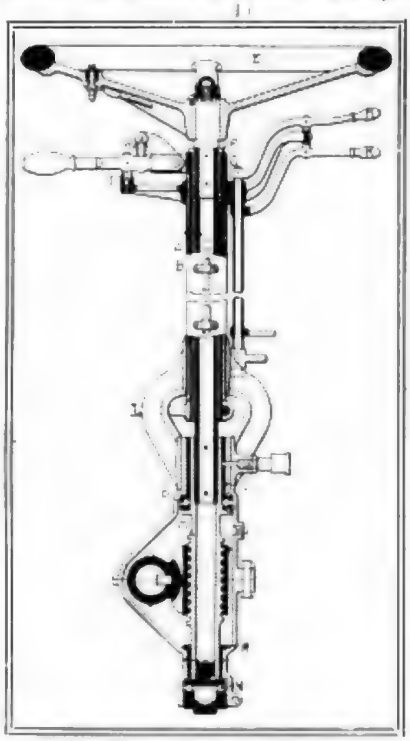


THREE models will be put on the market for next year by the George N. Pierce Co., of Buffalo, N. Y. One will be the well known 8-horsepower Pierce stanhope, and the two leaders a 28-32 horsepower touring car and a 40-45 horsepower machine. Both of these models are similar in practically all lines, the cylinder capacity of the latter being much greater as well as the other parts being considerably strengthened. In the line of changes over the Pierce Great Arrow that won laurels in the Glidden tour, the most noteworthy is the changes in the sliding gear set, direct drive on the high speed now being used, this is new with Pierce machines. Other changes are found: The inverted arched front axle has been replaced with an I-section bronze one, which, like the previous ones, has a heavy inverted arch between steering knuckles, with seatings on which the springs are clipped. The carbureter is altered in that the float is fastened to the stem and a ball valve used instead of a needle one. The shape of the mixing chamber is changed, it being a little higher. The following details are of the 40-45 machine:

The frame construction is made from pressed steel of 20 to 30 point carbon steel. The channel is 4½ inches deep in the center and tapers to 2⅝ inches at the ends. Three tie pieces unite the side members, each is of section similar to the side ones which they connect and is riveted in place and reinforced by angle plates. At the ends are other cross pieces. The front semi-elliptic springs are 40 inches in length and the rear ones 53 inches. The front ones are shackled at their rear ends—the shackles being above the springs so as to work under compression instead of tension so as to prevent the possibility of the spring flipping under the shackles and endangering the steering. The rear springs are shackled at the rear ends but positively connected at the front. The axle A has the flattened seating B, with the vertical center bolt E piercing the spring leaves C. The clip D bolts to projected flanges on the seating B.

Pierce bodies are of new design. Cast aluminum is used almost exclusively in their construction. Front seats are of the individual type. In the rear is accommodation for three passengers with baggage. The dash is dished and has solid brass mouldings and within it are two cabinets for carrying small articles. The wheel base is 109 inches.

The Pierce motor is a four cylinder one, with separately cast cylinders, the castings being flattened on the sides to admit of the cylinders being placed closely together, not making the motor length unduly long because of the four separate castings. In the 28-32 horsepower machine the bore and stroke are 4¼ by 4¾ and in the 40-45 horsepower model these measurements are 5 by 5½ inches. Each cylinder is an integral casting with the exhaust valves in ports on one side and the inlets in similar ports on the other side. The valves are interchangeable and have a diameter of 1 15-16 inches. The removal of them is a simple



THE PIERCE STEERING COLUMN

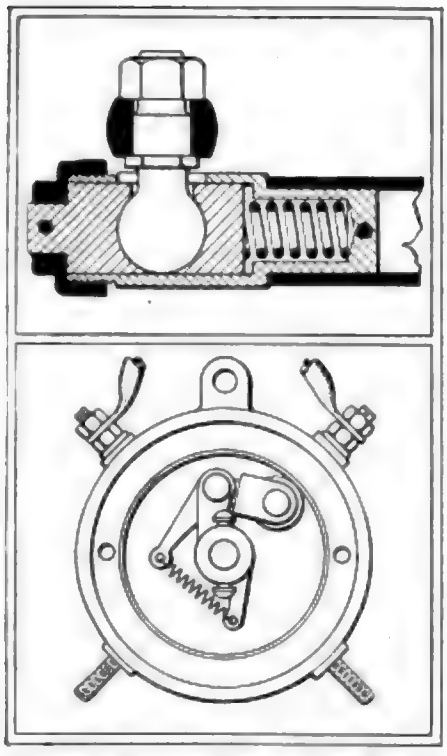
act, the screw A being removed, the cover B is loosely screwed in place and can be taken off by hand, after which the cover C is lifted out and the valve disclosed. The valve heads, beveled to 45 degrees, are not made integral with the stems but are riveted, screwed and brazed to the stems. The usual rollers are not found on the bottom of the push rods, but hardened steel shoes D are made use of, these working in renewable bronze guides E. The cam shafts are driven from the front end of the crank shaft, there being a small gear on the end of the shaft and above it another gear with which the two cam shaft gears mesh, the interposing of a gear between the one on the crank shaft and the two on the cam shafts permitting of the use of smaller gears.

The crank shaft is a solid steel forging with ground bearings throughout, running in adjustable bronze bushings. The shaft revolves on three bearings, two long end ones and a similar one between the middle cylinders. All of these bearings, as well as those of the crank pins, are 1 13-16 inches in diameter. The wrist pins are of steel, case hardened and ground and are secured by taper set screws. Marine type connecting rods, forged from steel and fitted with bronze bushings at both ends are used. The crank shaft bearing being carried on the top part of the crank case, the bottom part of the case can be removed for making examinations without dismounting any of the motor parts.

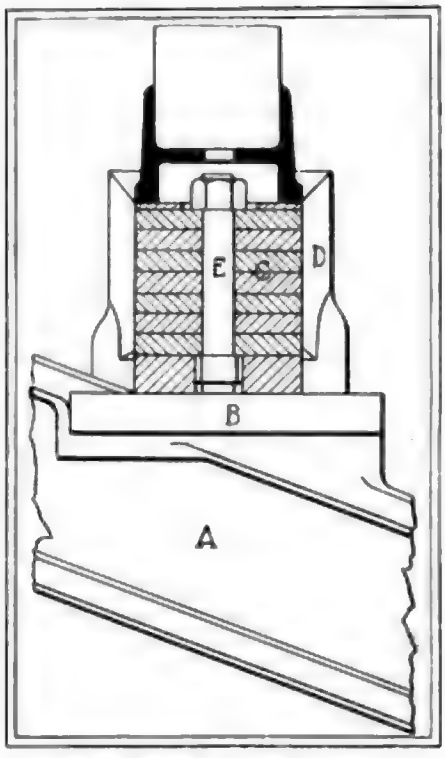
Motor lubrication is looked after with the greatest detail. On the bottom of the crank case is an oil pit F from which oil is pumped by the pump G and forced through the piping K to the oil reservoir L at the top of the exhaust side of the motor. The oil pump is driven by means of a worm from the cam shaft H. From the reservoir three pipes M, only one of which can be seen in the end section, but the three can be found in the side view, carry oil to the three crank shaft bearings. After passing through the bearings the oil enters the bored crank shaft at N, and by centrifugel force is carried to the crank pin bearings, lubricating them and then drops into the crank case, where it unites with the splash to oil the cylinder walls, the pistons carrying it for this purpose. The wrist pins are supplied also from the splash. It can be noted that in the top of the pipes M where they leave the reservoir are oil straining gauzes for the removal of dirt.

The commutator is of the roller type, and is placed vertically on a shaft between the third and fourth cylinders, and is driven by bevel gears off the cam shaft. The revolving contact is a hardened roller held against the casing by a coil spring so that long contacts with

Google



SPRING IN STEERING TIE ROD AND TIMER



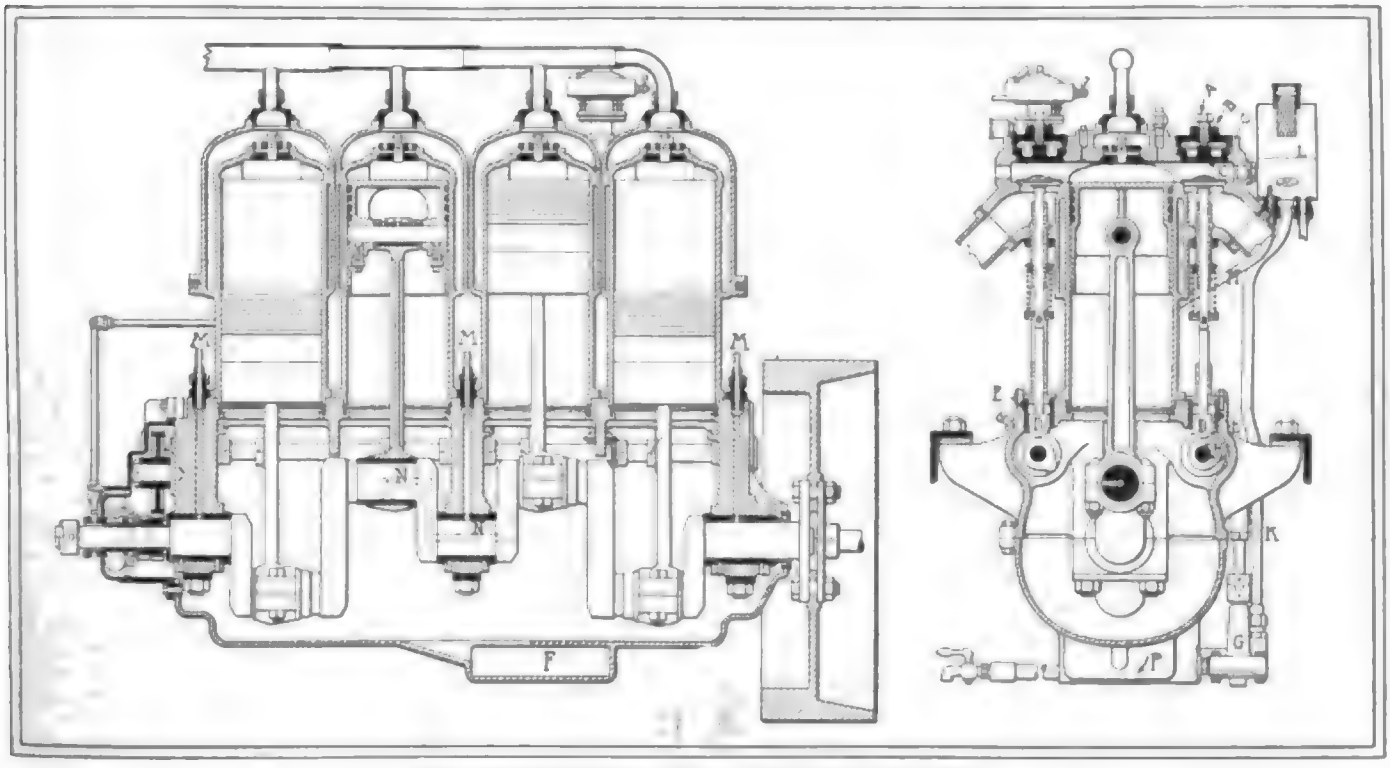
PIERCE FRONT SPRING SEATING

the stationary contacts are more certain. Current comes from a 6-volt storage battery with ten dry cells carried as a reserve. Five individual spark coils with vibrators on each are carried, one serving as a spare in case any of the others gets out of order.

The water circulation is maintained by a rotary pump, driven by a gear meshing with the exhaust cam shaft gear, taking its supply of water from the bottom of the radiator and delivering it to the water jackets at the lowest point. The water leaves the top of the jackets returning to the top of the radiator. A belt driven fan behind the radiator is used.

The Pierce steering column consists of three concentric tubes—A, forming the outside or supporting part of the column; B, the tubing to which the gear shifting lever D is attached; C, the central tube, to the top of which the steering wheel E is secured. Between these concentric tubes are suitable bushings, F at the top being between the central and middle tube and G between the middle and outer tubes. Near the base of the column, and just above the steering gear, is an expansion in the casing for containing the lever L, which connects with the gear shifting rod from the gear box. The shifting lever D has four positions, the forward one for the reverse, the neutral just behind this and the first, second and high speeds in order to the rear. On the under side of the lever is the wedge-shaped piece T for anchoring the lever in the notches in the quadrant, and a spring W on the upper side of the lever aids in holding the piece T in the notches. The lever D is slightly longer than the radius of the steering wheel. On the opposite side of the column are two levers, H for the throttle and K for advancing and retarding the spark. These are fastened to rods outside of the steering column and have levers at the lower ends connected up with the respective parts.

The steering gear consists of a multiple threaded screw M pinned at the upper end to the tubing C and provided with end-thrust bearings P and Q at its upper and lower ends. The screw has suitable bushing, R and S, at top and bottom. The upper bearings rest against a flange on the screw and the lower ones on a plate, plugging the lower end of it. Surrounding M is a nut N with trunnions on it, upon which are die blocks that slide within the jaws of a forked lever that carries the spindle connecting with the tie rods uniting the steering knuckles. This construction gives an irreversible steering gear, with none of the vibration of the steering wheels being communicated to the steering wheel. The column is in general design the same as that at present in use, but when mounted on the cars will be more inclined, lending a touch of rakishness to the vehicle. The eliminating of the side change speed lever facilitates



SIDE AND END SECTIONAL VIEWS OF THE 1906 PIERCE MOTOR

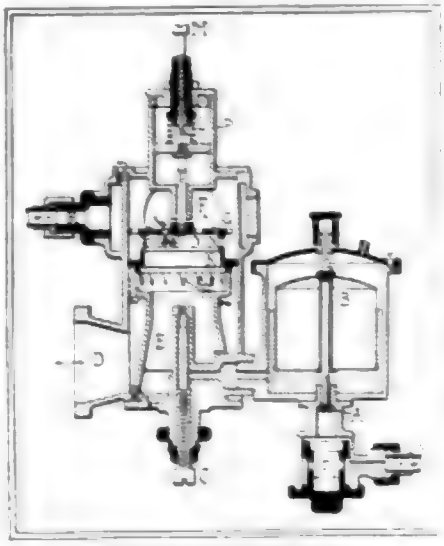
Transmission Set and Clutch Arrangement in 1906 Pierce Great Arrow

entering the front seats from the right side, the brake lever not interfering.

By far the most noticeable feature of 1906 construction in the Pierce transmission gear, is the use of direct drive on the high speed. Previously, Pierce transmission gears have been constructed with the propeller shaft to the rear axle in line with the counter shaft of the transmission so that on all speeds ahead the drive was transferred from the main to the counter shaft. With the present flexibility of motor speed, it is possible to run the car the most of the time on the high speed, and using direct drive on this speed, means, as well now proved, a material conservation of power. The use of Hess-Bright ball bearings throughout must also be added as one of the features of the transmission. These bearings are of the self-contained type, the balls being retained by an inner and outer ring, grooved suitably to form races for them. The balls are separated by short coil springs with leather washers between the ends of the springs and the balls.

The transmission gear gives three forward speeds and one reverse. Connection with the engine is through the fly wheel Y, which is suitably bored to receive the cone clutch A carrying a leather facing. The clutch part A is bolted to the sleeve Z which has a bearing on the extension G on the crank shaft which has a flange equal in size to the flange W on the end of the crank shaft and between these the fly wheel is bolted. The clutch is engaged through the collar B working on the hub T, ball thrust bearings being used between the collar and the hub, and the hub is in turn held by means of the screws to the clutch. The spring C bearing at one end against the clutch for holding it in engagement, at the other end bears upon a collar providing with end bearings D, the bearings being held on the shaft G by the nut U pinned in position. In taking the drive from the clutch A to the gear case, a master gear H is made integral with the sleeve I to the end of which is keyed the claw clutch F, having two fingers which engage in slots K in the end of the hub T of the clutch. This arrangement allows the clutch to be moved along the extension G on which it rests when out of gear.

Within the gear shaft case is the main shaft E having its front end bearing within the sleeve I and the gear H and its rear bearing at the back end of the case beyond which it carries a universal joint connecting with the propeller shaft S to the rear axle. On this shaft, which is squared, is the sliding unit comprising two gears M and O both bored to the sleeve N. This unit can be moved backwards and forwards by the end thrust collar V attached to the sliding rod in the side of the case. A noticeable feature in connection with this rod is the adjustable ball joint connection between it and the gear shifting rod outside the case. For high speed, the sliding unit is carried to the front of the case so that the four projections on the front face of gear O mesh with recesses in the rear face of gear H, thus locking the shaft E with the sleeve I and the clutch A and causing the shaft E to revolve at the same speed as the crank shaft.



The Pierce Carburetter

For slow speed ahead the gears are meshed, as shown in the illustration; gear J on the countershaft X meshing with H and the countershaft gear L meshing with M. It must be remembered that the gears on the countershaft are keyed in position, revolving when the shaft revolves and not being slidable on the shaft. To study the speed ratio on the slow speed can be easily done. The gear H has twenty teeth, while J has forty, causing the shaft X to revolve at half the speed of the motor. The gear L with 18 teeth meshes with M, having 32, so that the shaft X revolves 1.77 times while the shaft E makes one revolution. When traveling on low speed then, the engine shaft makes 3.54 revolutions while the shaft E makes one.

For second speed ahead the gear O is meshed with gear P, and as both of these gears have the same number of teeth, the shaft E revolves at the same rate as the shaft X, causing the shaft E to travel at half the speed of the crank shaft. When reversing, gear M is meshed with gear R. The latter is an idler on a separate shaft in the bottom of the gear case and is in constant mesh with gear Q on the countershaft, and being interposed between gears Q and M gives the latter a reversed movement.

Careful construction is a feature of the gear case throughout. This can be noted in the caps which fit over the front and rear ends of the countershaft X, making it impossible for dust to reach the ball bearings. The latter are retained in position by means of a castellated nut which holds a washer firmly against the bearing rings.

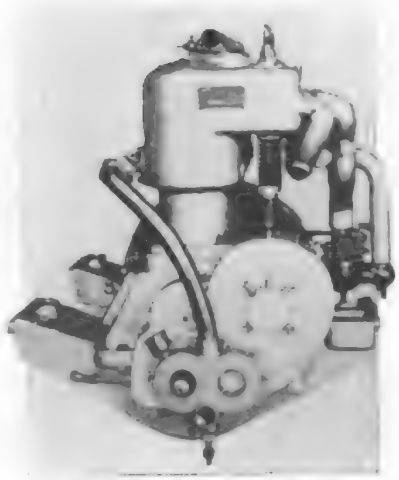
The gear shifting rod is interconnected with the clutch A, making it impossible

Digitized by Google

to strip gears in changing speeds. This is accomplished by having the gear shifting rod extended toward the front with holes in the extension part corresponding with the different gears. Into these holes drop bolts. A bolt is connected with the bell crank lever moving the clutch so that when the clutch pedal is depressed, the clutch is thrown out and the bolt withdrawn, permitting of the gear shifting rod being moved by the changing lever. Should the pressure on the clutch pedal be released before the gears are in mesh the bolt will bear on the gear shifting rod, not letting the clutch into engagement until the bolt drops into the hole in the rod.

The transmission of power from the gear set to the road wheels is through the jointed propeller shaft S, part of which is shown in the section of the gear case. Each end of the shaft carries a universal joint, one of sliding patterns for shortening the longitudinal length of the shaft when the springs are depressed. In the rear axle, of the live type, the drive shaft is divided in the center, each half carrying one of the bevels in the differential. Ball bearings are universal, both for carrying the car and taking up end thrust. The differential runs in oil.

The 1906 Pierce carbureter is altered in a few respects from the one in use this year. In this connection the ball valve A on the bottom of the stem carrying the float B is used instead of the needle valve previously, and the action of the opening and closing of the valve is simplified in that when the float rises the stem being rigid with it is raised and the fuel passage closed, whereas in this year's type a pair of lever arms are used at the bottom of the float on which it rests, thus raising the stem which is not fastened to the float, but moves freely in the center of it. The adjustment of the needle valve C is most accessible. A slight change is found in the height of the space E through which the air travels after entering through D. The space E is slightly contracted so that the inrushing air is better directed against the head of the nozzle. In ordinary running the air and gasoline, after mixed above the nozzle, pass through the holes W in the top of the valve G and pass out through opening F to the motor, but when the motor suction increases enough mixture cannot pass this way to satisfy the motor and the valve G is raised against the tension of the spring L within the dash pot P, and air passes through the triangular openings H, the part of the valve G, shown at K, having been raised the holes H are gradually uncovered. In uncovering these holes the smaller part is uncovered first, and as the spring L is pressed together and greater force is needed to press it still further, the openings H widen so that a very slight raise of the valve part K will let in more air than similar raises when the valve is just starting to uncover the holes. It is understood that when the motor is running very slowly the valve G is much lower than shown in the illustration, in fact, the top of the valve rests on the shoulder, so that all mixture passes through the holes W, but with a little greater motor speed the valve G is raised and the radial holes N uncovered and



End View Milwaukee Motor

more mixture passes, but with still greater speed the valve is further raised and the V-shaped series of holes H gradually uncovered, and air that does not pass by the spraying nozzle is admitted through them. By thus taking air to the motor that does not pass by the spraying nozzle the suction on gasoline in the nozzle is slightly reduced and too rich a mixture at fast motor speeds avoided. The dash pot piston Q, solid with the shaft T, is used to prevent fluctuations of the valve G, the dash pot with air pressure above and below the piston makes the movements of the valve much more gradual. At the top of the carbureter is the adjusting screw M by which the tension of the spring L can be varied and the amount of pressure to lift the valve G varies. With a compressed spring more motor suction is needed and with a slight compression of the spring less is needed. The mixing chamber is heated by exhaust gases entering through the passage R.

The brake drums on the rear wheels serve for both the regular and the emergency brakes, the inside of the drums being used for internal expansion brakes, foot applied, and for general use, and the outside for the lever—applied emergency brakes. The emergency bands are made of steel, with bronze lining, and are pivoted at the bottom, both top ends being drawn together by a toggle joint arrangement, the internal bands, or shoes, are also pivoted at the bottom and are expanded by a cam. In both sets coil springs normally hold the bands away from the drums. Both sets are interconnected with the clutch, the latter being disengaged with brake application.

MOTOR MADE IN MILWAUKEE

A 36-horsepower gasoline motor especially designed for use in commercial vehicles and large touring cars is being manufactured by the Milwaukee Auto Engine & Supply Co., of Milwaukee, Wis. It has a bore and stroke of 4½ by 5 inches and has a shaft speed of 150 to 1,600 revolutions per minute. The motor follows standard lines used in separately-cast cylinder engines and has both sets of valves on the left side and operated from a single camshaft. Undue length of the motor, owing to separately-cast cylinders, is guarded against by having the castings slightly flattened at the sides so that the cylinders stand close together.

The aluminum crankcase is cast in two parts, joined at a horizontal center line, both parts being divided into four independent spaces, one for each of the crankshaft throws. This construction permits of the use of five extra long bearings for the shaft, and also facilitates the lubrication of each cylinder bearing, as well as the cylinder walls, the oil for the splash having no opportunity of flooding one cylinder and starving the others. On the bottom half are four supporting arms, two of which are provided with oil reservoirs for supplying oil to all the main cylinder bearings. The top half is divided into four chambers, on top of each of which is an opening in which the cylinder is bolted. On the right side of the top half of the case are four large inspection openings, covered with caps especially arranged for quick removal, so that the inspection of the crank throws may be quickly made.

THE PRACTICAL RUNABOUT WHEN FINISHED

The crankshaft, made from 30 point carbon steel, is a drop forging, ground to 1¾-inch diameter, and runs in bronze bushings, which are machined on the wearing surfaces. On the rear end of the shaft the 120-pound flywheel is fastened with screws and keys and on the front end of the shaft is fitted the driving gear for the half-speed shaft and the circulating pump. The two end cranks are set in pairs opposed to the center cranks, producing explosions at every half revolution, the order in the different cylinders being second, first, third, fourth. The connecting rod pins are ground and bored hollow to furnish lubrication to the lower connecting rod bearings and to the two end crank bearings.

The valves are located in the bottom of the ports, the inlets in the two front and two rear cylinders being at the adjacent sides of the ports, so that Y-piping can be used in conducting the mixture to each pair. The valve heads are made from grey iron, beveled to 45 degrees, with 2-inch top diameter, which tapers to 1⅝ inches. The steel stems, with hardened ends ⅜ inch in diameter, are driven into the heads, and at the lower ends are slotted for flattened keys, on which rest the aluminum cups for retaining the tension of the valve springs. The camshaft is a ¾-inch ground rod, and carries the commutator on the front end. The cams are made in pairs, the intake and exhaust for each cylinder being machined from one piece of metal, which is pinned to the shaft, the pins in turn being secured by aluminum threaded rings. On the bottoms of the push rods are hardened flat flanges which rest on the cams and have loose vertical stems working in bronze guides. The camshaft revolves on three long bronze bearings and runs throughout its entire length in a bath of oil.

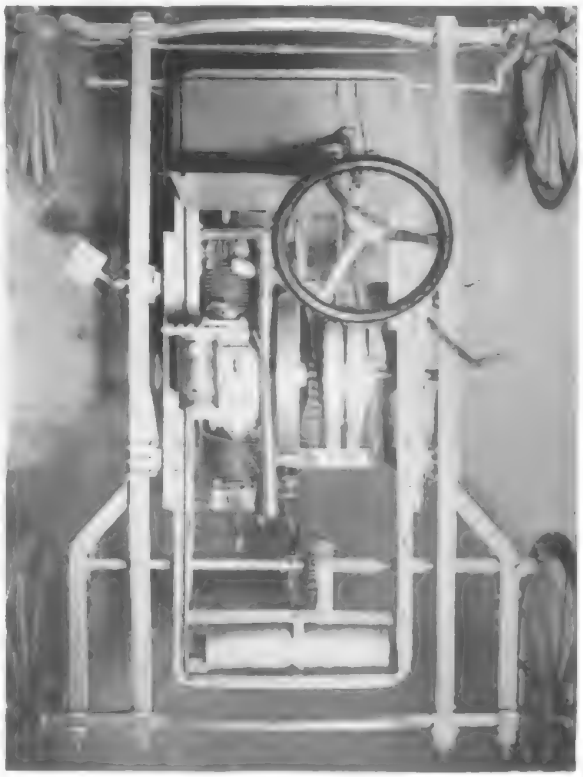
Pistons are 6 inches long and ground .003 smaller than the cylinder bore. They carry three compression rings and wide oil grooves. The former, 5-16-inch wide, are eccentrically ground and pinned against rotation. The wrist pins, 1⅛ inches in diameter, made from hardened tool steel, are hollow bored and held in position by two setscrews and locknuts.

Water circulation is furnished by a bronze gear pump, shown in the end view of the motor on the front end of the crankshaft. It has 1-inch pipe openings and supplies water to the lowest part of the water jackets at the right. The water after passing through the jackets leaves from the top center of each jacket and passes to the top of the radiator.

MADE FOR DOCTORS

The Culver runabout, built by the Practical Automobile Co., of Aurora, Ill., is the outcome of ideas of a physician, De Los Culver, who has had considerable experience with automobiles and which led to the discovery of the motor car's shortcomings from a physician's standpoint. The product of the Practical company can be considered a matter-of-fact runabout, one built wholly for service. It is, comparatively speaking, a small car, and, while large wheels are used, the body is so hung as to be as near the ground as the average automobile. Noteworthy in its design are the large wheels fitted with solid rubber tires, designed to overcome puncturing and still retain much of the resiliency of small pneumatics. In the power plant, consisting of a double opposed air-cooled motor, connected through a planetary transmission and double side chain drive, nothing out of the ordinary is met, plain bearings being used throughout. This construction is to eliminate adjustment while on the road, for the designer had almost wholly in view the needs of a physician in the matter of an automobile, and a physician simply must not break down.

The Culver frame is an angle iron rectangle with two cross pieces to carry the motor and transmission. Each cross piece projects beyond the side angle pieces to form seatings for the long side spring, extending from the front to the rear axle. Each spring is a semi-elliptic of six leaves, with the long bottom leaves clamped at the ends on the top of the solid square axles and in the center clipped to each frame cross piece. Both axles are slightly arched in the center, and carry little truss rods directly beneath, that on the front axle fastened at the ends to the lower part of the steering knuckle jaws and that on the rear fastened to the axle ends. As a support for the long side springs two extra frame pieces, serving as braces, are clipped to the rear axles just inside the wheels, and, extending forward parallel with the frame, support the ends of the differential countershaft and then turn inward and are fastened to the ends of the rear cross piece, serving not only as a side brace for the springs but a support as well. Both axles are of square section 1¼-inch to the side and are made of axle steel. The use of plain bearing for the road wheels is one outcome of the physician's experience, trouble having been experienced with broken balls, when emergency trips were being made, and to overcome jar the rear wheels are made with a 40-inch diameter and the front 38 inches. Solid tires secured by a center



CHASSIS OF THE PRACTICAL RUNABOUT

Digitized by Google

wire are fitted. The wheel base approximates 72 inches and a speed range of from 4 to 25 miles an hour is offered.

The motor has a 3 3-16-inch bore and 4-inch stroke, the rating being 6 horsepower at normal crankshaft speed. It is placed lengthwise at the left side of the frame, thus making room for the gear case to be hung at the right, with the flywheel and drive sprocket separating it from the cylinders, giving typical construction in the disposition of the power and transmitting parts. Each cylinder is surrounded by heavy circular flanges for cooling and in the heads and valve cages are longitudinal flanges. The valves, placed oppositely in the cylinder heads, are, in the case of the inlets, atmospherically operated but for the exhaust the usual push rods and camshaft are used. The valves are 1½ inches in diameter; the inlets have a 3-16-inch lift and the exhausts 1 inch. Mixture is supplied by a Gaveleck floatless carbuereter, placed close to the crank case and a thumb lever on the steering column alters the throttle and another cares for the spark. The spark plugs are placed above the inlet valves. The commutator is fitted on the half-time shaft and is fully protected by a dust and waterproof case.

The planetary gear case gives two forward speeds and one reverse, a side lever giving the direct drive and the reverse and a pedal being brought into use for the slow speed. On a sleeve on the crankshaft is an eight-tooth sprocket, from which a single chain transmits to a twenty-four-tooth sprocket on the countershaft. On this shaft are sixteen-tooth sprockets connected with forty-tooth sprockets on the rear wheel. On slow speed the reduction is two and a half to one, and on the reverse three to one. A speed of 15 miles an hour is claimed for on rural roads. The differential is carried on the countershaft.

For lubrication a pressure feed oiler is attached to the motor at the top of the crankcase. The oil is fed according to the motor speed, stopping when the motor stops and starting when it starts. Six feeds leave the reservoir, one for each of the engine bearings, one for each of the two crank pin bearings and one to each cylinder. On the end bearing of the gear shaft is a grease cup; other grease cups are placed on the countershaft bearings. A Kingston muffler is fitted. A fibre lined band brake is fitted on the countershaft at the differential. The drum is 8 inches in diameter by 2 inches wide.

Steering is through a Brown-Lipe irreversible gear on the bottom of an inclined steering column. To facilitate entering the vehicle the wheel can be tilted. The body work is of piano style, 28 by 68 inches, with a free carrying space of 28 by 28 inches in the rear. The running gear is in Brewster green striped in carmine, with a black body. Black upholstering is used.

A COLUMBUS-MADE MOTOR

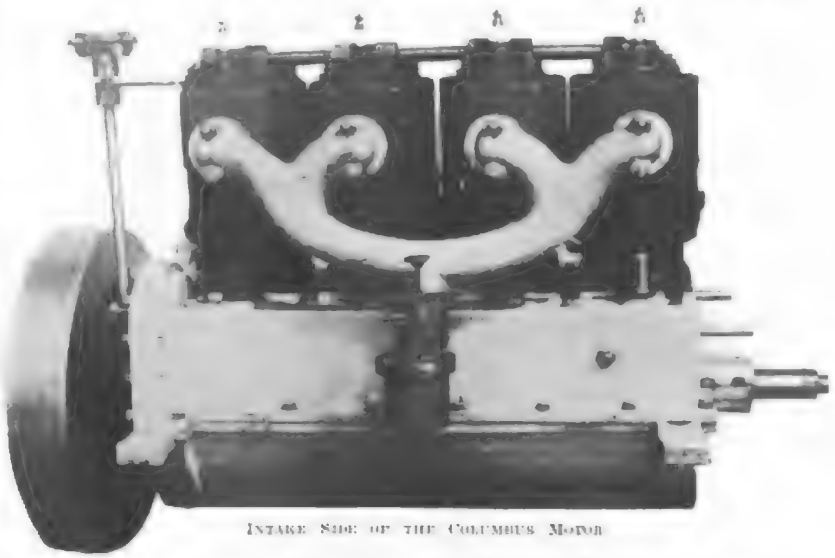
The Columbus Screw & Machine Co., of Columbus, O., manufacturer of marine gasoline motors, has for the automobile trade a four-cylinder motor. The motor follows the familiar lines used in water-cooled motors of the four-cycle class, in which each cylinder is a separate casting with the inlet and exhaust valve ports on opposite sides, with the head as well as the valve ports cast integral with the cylinder. Thirty horsepower is given with a crankshaft speed of 1,200 revolutions per minute. The bore and stroke of the cylinders are 4½ inches.

In manufacturing the aluminum crankcase the bottom part has been designed to rest on the chassis frame, four integral lugs being provided for this. With this mounting, the top part of the motor with all moving parts can be removed, leaving the bottom part in place on the frame and thereby not disturbing the alignment. The top part of the crankcase is box-like, with openings in top for the cylinders and others on the left side for inspection. The rear end of the case is removable and the end bearing is carried in the end plate. The crankshaft, made from 30 point carbon, hammered steel, has five bearings, two long ones on the end and one between each adjacent pair of cylinders. All the bearings are 1⅝ inches in diameter, those on the inside are 2¾, the front one 4 and the back one 5 inches long. The crankpin bearings are 1⅝ by 2⅛ inches. The flywheel is made plain or is adapted for friction clutches. The pistons are made with flat tops, straight sides and are fitted with three compression rings near the top. In addition there is a pair of shallow oil grooves near the bottom, adapted to be filled by the splash when the piston is at the bottom of the stroke. The crankpin is made rigid with the journals, and the connecting rods of drop forgings are eyeholed at the wrist-pin and split horizontally at the lower end. Oil grooves are made in the bearings. The wrist pins are 1 1-16 inch in diameter. Babbitt bearings are used throughout except in the top ends of the connecting rods.

Mechanical valves, 2 inches in diameter and with a lift of ⅜ inch for exhaust and 3-16 for intake, being on opposite sides, two cam shafts are needed. Both are hardened steel shafts driven by enclosed steel gears and splash lubricated.

The inlet pipings on the right side are formed by an integral tubing of scroll-like curves, each branch being secured to the valve port by bolts. By carrying the carbureter close to the crankcase the mixture has a short distance to go and no sharp curves to pass. The spark plugs are placed vertically in the cylinder heads. The commutator is carried on the top of a vertical shaft at the rear end of the motor, a brace from the top of the back cylinder forming a top bearing for the shaft. Bevel gears transfer the drive at the bottom of the shaft. The water cooling arrangements are standard throughout, one set of pipes connecting with the cylinders through the heads and the others through the sides. Circulation pumps, of any design, can be attached.

The length of the motor, owing to separately-cast cylinders, is not more than normal, partly because the cylinders are mounted closely together and also owing to the round on the cylinder castings being slightly reduced at the sides. Accessibility has been kept in view in all the design, inspection caps give ready access to the valves, permitting of quick removal by taking off a couple of nuts and the commutator and water pumps are conveniently placed. Lubrication is by splash from either gravity feeds or positive oilers.



INTAKE SIDE OF THE COLUMBUS MOTOR

MOTOR CAR LITERATURE

The Beaver Mfg. Co., of Milwaukee, Wis., is mailing a four-page folder illustrating on the cover its two-cylinder opposed motor and on the inner pages showing plan and sectional line views of the same, together with a few measurements. The company has similar folders on its four-cylinder motors intended for use in large automobiles.

King automobile tops, made by the King Mfg. Co., Springfield, O., are shown attached to Logan, Thomas, Ford, Union, White, Cadillac, Packard and other machines in a long folder now circulated by the manufacturer. Besides illustrations, the sizes, prices and materials used are given. A few letters of recommendati- are included.

ROADSIDE TROUBLES

An Ounce of Prevention

Copyrighted by the American Motor League

By Chas. E. Duryea

THE ENGINE, continued—Like an ill-trimmed lamp, a gasoline motor may produce a most objectionable odor. The products of good combustion are substantially odorless, the amount of lubricating oil used in a good motor is so small that it need hardly be considered, so the presence of objectionable odor should be taken as an indication that something is wrong and search for the trouble should be instituted. The odor of gasoline indicates either a leak or an escape of vapor from the tank or failure to ignite the charge. At ordinary temperature gasoline evaporates very slowly and the amount that escapes from an automobile tank through the ordinary vent is so slight as to be imperceptible even by delicate noses. Much odor therefore would indicate either a leak or that the gasoline was abnormally hot; a condition requiring investigation and remedy. Remove the tank to a cooler place if it gets warm. Of leaks nothing need be said, for surely everyone knows that they are most dangerous and should be fixed at once. Failure to ignite represents a loss in fuel and irregular running and should have attention.

A pungent odor usually indicates carbon monoxide which in turn indicates an excess of fuel; a condition easily remedied by adjustment of the vaporizer. While it is true that forcing a fire by feeding it an excess of fuel, will develop a slightly higher temperature, and therefore more power, this procedure is very wasteful, and such a condition should be corrected. It is therefore advisable to have the vehicle equipped with a larger motor than necessary and run with a poor mixture which, containing an excess of air insures perfect combustion with highest economy of fuel and without odor therefrom. An excess of lubricating oil in the cylinders of lubricating oil of too low fire test will likewise cause odor, the remedy for which is obvious. Usually smoking oil can be known by the blue smoke. Too much gasoline produces a black sooty smoke.

Overheating—This trouble arises from many causes. Steam engineers know that a steam engine must be kept hot to give best results, but many gasoline engine operators assume that the engine must be cold enough to permit holding one's hand against it and many stationary engines are found running this way; a clearly wasteful procedure. Because, however, under such conditions, a certain lubricating oil gives good results, and it is recommended and tried for automobile use and being of too low fire test, it smokes away, gumming up the piston rings, permitting the hot gases to escape by the pistons, causing decrease of power and giving rise to other objectionable symptoms, all termed overheating. If, therefore, this symptom is found after a change of lubricating oil, it is fairly safe to blame the oil. Insufficient lubrication produces similar results. Broken piston rings or scored cylinders permit the gases to escape, carrying the oil with them but leaving the heat in the walls as in insufficient lubrication. Some pumps will not start if there are air bubbles in the circulation pipes and where radiators are depended on, they should be felt frequently to know that the pump and circulating system is on duty. So unreliable are some pump circulations that telltale gauges are used. A dry crank shaft bearing, crank pin bearing, or in fact, any bearing revolving at speed is liable to overheat. Smoking, pounding and loss of power are symptoms and should be investigated.

Some of the anti-freezing solutions do not circulate as readily as water but get much hotter, causing trouble with lubricating oil perfectly satisfactory with water. They are sometimes the cause of premature ignition and other symptoms of overheating. When such solutions are used ample pump and radiator surface must be provided or else the solution must be such that it will circulate thermostatically quite rapidly as does water, or else the piping must be enlarged to equalize the slower circulation. Liquids should not be used that are likely to deposit solid particles either when hot or when cold. Some oils, for example, deposit carbon when boiled, as does molasses, which soon forms a coating on the cylinder walls and prevents proper cooling. Be sure to watch for symptoms of a clogged circulation. A gravity circulation is largely thermostatic and circulates fastest when hottest, but a pump friction or fan belt may slip most when hottest and allow overheating.

Starting Trouble—In a piece of mechanism containing several elements, all of which must be right at the same time to secure proper operation, starting troubles are sure to be found. Here the multiple cylinder motor has advantages over the single, for it is not likely that the mechanical parts of all the cylinders will become deranged at the same time. These parts, however, can be inspected and if the cam shaft turns, the valves open and close, the sparker parts operate and there is a good compression it may be assumed that the motor is ready to go if given fuel and spark. Since the ignition is the most delicate, it should be first inspected, after which the carbureter should be examined. Broken wires, short circuits, bad insulations, stuck vibrators, weak battery cells, insufficient magneto speed and many similar things may interfere with the ignition. Gasoline not turned on, ice water in the fuel, dirt in the float chamber, waste in the air pipe, no gasoline, a broken or detached inlet pipe or an improper mixture being either too rich or too poor, may be among the fuel troubles. A cold mixture requires a larger spark than a hot one, but fortunately any battery is usually stronger after a rest than before.

Cold Weather—On a very cold day ordinary gasoline sometimes will not evaporate, but refuses to ignite, just as if it were kerosene. In such event the cylinder or the supply pipe should be warmed. This will not only warm the gasoline and make it vaporize, but will thaw out any ice that may be holding the float or stopping the supply pipe. A drop of water will lie in most unexpected places and when frozen into ice, causes trouble, which would not have occurred from the water alone. On this account all tanks should be provided with depressions having a cock at the bottom, which will tend to catch the water and permit it to be withdrawn. Frequently an engine is stiff, so that it cannot be turned rapidly enough to properly vaporize the charge. In this event either the cylinders should be heated by pouring hot water on them or holding a torch or lamp under them, or—with great care—squirting a little gasoline over them and ignite. Desperate means are sometimes necessary on desperate days, but when fire is used in this manner it must be kept under control. **Do not squirt on a lot of fuel before igniting.** This means a big fire impossible to control. Apply first a few drops and set fire to it, then apply more as occasion demands. You cannot explode an ordinary squirt can containing gasoline, and can direct and control the flame as wanted in this manner. Many users inject kerosene to cut the grease before leaving the motor after stopping. This is good practice, but too troublesome for the average man. Gasoline injected before starting on a cold morning will serve the same purpose. Care must be taken not to get too rich a mixture by this procedure and if it fails to ignite, turn a few times with the fuel supply shut off.

Formula for Starting—Starting troubles are sometimes the fault of the operator who neglects to do some important and necessary thing. Probably every user can remember a time when he failed to close the switch, open the throttle, turn on the gasoline or do some little thing of this kind simple but necessary. It is extremely aggravating to waste time and muscle for a needless reason like this and the only way to prevent it is to follow a formula each time, which includes all the necessary starting operations. Some of these may not be necessary for that particular start because, for example, the gasoline may already be turned on, but if each of the necessary points is made sure, the motor will usually start. Here simplicity again asserts itself. A simple motor needs but a simple formula.

EDITOR'S NOTE—This is the fifteenth of a series of articles by Charles E. Duryea. These articles will be prepared for publication in book form and will be distributed by the American Motor League to its members during the coming year.

PIONEER AMERICAN MAKERS
RANSOM E. OLDS

EIGHTEEN years' experience as a builder of automobiles surely ought to qualify a man to write "veteran" after his name. Admitting the truth of this logic, R. E. Olds, president of the Reo Motor Car Co., of Lansing, Mich., is entitled to considerable credit for the part he has taken in building up the industry. It was in 1887 that he built his first automobile and since that time he has been prominently identified with the trade as a designer as well as a manufacturer. That first car, constructed a decade and a third ago, was of peculiar construction compared to the modern machine. It was a three-wheeler, the box or body being very deep so that the rear axle passed through the sides of the body in order that the machinery might be entirely concealed inside. For propelling power Mr. Olds used a 3 by 8 cylinder steam engine, with a horizontal porcupine boiler, with gasoline for fuel. After testing this for some time, Mr. Olds changed to a flash boiler. With this machine he experimented on the streets of Lansing, but it did not come up to Mr. Olds' idea of what was right, so it was taken back into the shop and more gray matter was used in improving it. It was thoroughly remodeled and when it once more made its appearance on the streets it looked like a new machine. It had been converted into a two-cylinder affair and four wheels were used instead of three Olds started out with.

While it ran much smoother than the original car, Mr. Olds was still far from being satisfied with it. The inventor became convinced that he was not getting the best results with steam power for the reason, he thought, that if put on the market, with its delicate parts, it would prove too complicated for the average user. All this while he had been experimenting with a little gasoline engine and boiler. It had been well tested and met with a ready sale. This led Mr. Olds to go to work on an explosive engine, which he finally evolved into something useful as a commercial proposition. It apparently gave universal satisfaction, so the inventor made up his mind that it was the only power for the automobile. He then proceeded to put this idea into execution, with the result that in 1893 he started to build an automobile with the gasoline explosive engine. But at this time he was far from reaching perfection. There was plenty of experimenting to do and Mr. Olds was determined to be right before offering his product for general sale. About this time the Chicago Times-Herald came out with its offer of $5,000 to the winner of the first automobile race scheduled in America. Every inventor at all automobilically inclined set his wits to working to produce a machine that would not only pull down that $5,000 pot, but would also demonstrate to the American public that the automobile was practical. Mr. Olds was one of these, but when the time for the race arrived he had not completed the machine, so did not take part in this initial contest run through the snow and won by Duryea.

"In 1897 and the year following I organized the Olds Motor Vehicle Co. with a capital of $50,000," says Mr. Olds in recounting his career in the last 8 years. "This company, however, did not secure any location, so that later on the Olds Motor Works was organized, with sufficient capital to take over both the Olds Gasoline Engine Works and the vehicle company, as I much preferred to operate under one head if I was to manage both companies. After this move, I was elected president and general manager of the Olds Motor Works and we then purchased the Olds Motor Works site on Jefferson avenue, Detroit, where I erected a plant and equipped it for the manufacture of motor vehicles. My first thought was to build a high-priced machine, but after spending a great deal of money and time in experimenting along this line, I could see nothing but discouragement, as was the case with other manufacturers at that time. The electric vehicle had made its appearance and was not considered a satisfactory vehicle; at any rate, the failures were on every hand. Then the steam machine came in and had 2 years of successful business. I could readily see that if there was not some moderate-priced machine to take the place of the $700 steam machine that the automobile industry would soon be a thing of the past.

"Working along these lines, I abandoned my ideas on the high-priced mechines and turned all my energies toward a light practical machine at a popular price. When it was learned that I proposed to put out a machine for $650 I was visited by several manufacturers who claimed that I would do a great injustice to the industry by coming out with a $650 machine, when there was nothing on the market short of $1,000 or $1,500. I felt, however, that it would do the industry a great deal of good. I could see there were thousands of people that could raise $650, but would not consider the higher-priced machines. My first thought was that it would be possible to produce a machine that would not weigh over 500 pounds, but when it was completed it weighed over 700 pounds, which was, later, made to weigh more by the adding of additional parts and attachments that I put on.

"In the fall of 1901, when I took one of these runabouts to New York and secured a small space in the Madison Square garden, I sold in 4 days over 1,500 machines. When it became noised around the garden that I would not take anything less than car-load orders, it seemed very queer to automobile people. I was, however, successful in convincing the agent. Any one familiar with the conditions of the automobile business at that time could not help but believe that it did wonders toward stimulating the automobile industry. During all my experience in the manufacture of gasoline motors, my record for over 23 years, while I was handling the Olds companies, shows that there was never a year during that period but that we did an increasing business. When it was known that I had retired from the old company, I was visited by a committee from New York capitalists that offered to put in a million dollar company, all paid in, and turn over to me a half interest, or controlling interest, if I would accept of the presidency and management. At that time, my thought was that I did not care to again take up the care of a large manufacturing industry. Later, however, through the influence of friends I was induced to again enter into the business. So far it has been wonderfully successful and I have reason to believe the industry is in its infancy."

THE REALM OF THE COMMERCIAL CAR

A. H. Tunker in His Inspection Car

THE municipal automobile is no Utopian conception; it is a dollars and cents investment in which the purchasers, generally public employes, have been led in their actions in buying the motor wagon in preference to horse-drawn vehicles because the former offers a cheaper, quicker, equally as reliable and more comfortable means of transportation.

Two years ago—in fact, 1 year ago—the mayors and city fathers of many of the biggest American cities were racking their brains in drafting arbitrary legislation, restricting as far as possible, the safe and legitimate uses of the motor car. Today many of these same officials use the little runabout or the heavier touring car in their daily tours of inspection and work in and around the city. Water commissioners who, 12 months ago, jogged lazily along, contented with Dobbin's 5-mile-an-hour jaunt, are going their daily rounds in the gasoline or electric runabouts and are much better pleased with an 8 to 20 mile ride on a pneumatic tired chug wagon than they previously were on the clattering steel tired buggy.

Park commissioners, in a metropolis like Chicago, find the motor car indispensable. Their duties require them to make daily inspections of all parks and boulevards coming under their jurisdiction, which duties, owing to the annual opening of new parks and the increase in the mileage of the boulevards, become impossible with the sphere of usefulness of the horse. Many park officials found their daily routine carrying them over a radius of 100 miles, a distance which could not be covered with three or four relays of horses in the average day. To such officials the automobile is daily proving a salvation; it carries them from place to place, at speeds equaling the limits prescribed by the city ordinances, which limits are, however, frequently exceeded, in order that the day's inspection may be completed within period of 8 or 10 hours. Superintendent Foster, of the Chicago South Park Board, which has fourteen parks under its control, covers 80 miles per day in his machine, while the assistant superintendent averages 102 to 105 miles per day in his round of parks and boulevards. On the same board Captain Kelly, of the police department, has 105 miles to his credit every day, and a few of the other park officials have an equally great daily mileage. All of these officials once used the horse, but the extra duties placed upon them by park additions made the motor car a necessity.

The fire departments, those departments under municipal control that rely essentially upon reliability and speed, are gradually adopting the motor car for the use of the fire chief and his assistants who are expected to be at the scene of the conflagration at the earliest possible moment. Chief Larkin, of Dayton, Ohio, is one of the recent converts and Chief Sullivan, of the San Francisco fire department, is another enthusiastic supporter of this use of the motor car. In New York, one or two fire chiefs have used the motor car several years and in other cities the heads of this department are experimenting with and testing the reliability of the machine. Fire chiefs who have used the automobile are unanimous in its praise, declaring that as far as reliability is concerned it is on a par with the horse and judged from the standpoint of speed and safety, while traveling on the thoroughfares, it far exceeds the equine. In Germany, England and France the use of the motorcar is not limited to the service of the fire chief, but hose wagons, chemical extinguishers, ladder wagons and fire engines propelled by gasoline motors are now in use in several of the leading cities. Berlin has used gasoline and electric fire engines in one of its districts for over a year, during which time daily calls have been responded to and not on a single occasion have the engines failed in their work of fire fighting.

This particular field is specially suited for motor propelled vehicles, as the calls are few and far between, during which period of waiting the motor wagon has no maintenance expense, whereas the horse-drawn wagons and engines require relays of horses that are eating their heads off between calls. Three or four English firms, among which can be noted the Wolseley concern, include the manufacture of fire-fighting machines in their regular output and manufacture chemical extinguishers, hose wagons and fire engines and recently have added to this list fire escapes and water towers for high service.

Hospitals, which, strictly speaking, are not under municipal control, are proving, however, a fruitful field in which the automobile manufacturers are finding ready sales. A few examples, taken from American cities, will serve to show the tendency in this regard. The Lakeside Hospital in Cleveland has used since January, 1903, an electric ambulance for transporting patients between the hospital, the city depots and their homes. Dr. Ranny, the hospital superintendent, states that after 2 years of continual use, he would, under no circumstances, revert to the horse-drawn type. The ambulance used carries 44 cells of battery and fitted with solid rubber tires can easily make 12 and 15 miles per hour. The superintendent, however, has one criticism—the solid tires do not sufficiently reduce the vibration when traveling at 10 miles per hour over rough streets, and he recommends strongly the use of pneumatics. The Boston City Hospital has recently installed an electric ambulance fitted with pneumatic tires, which averages 16 miles per hour, and has a running radius of 30 miles. This ambulance is constructed along modern lines and is a great step in advance of the horse-drawn class. Private parties are even taking to the automobile ambulance. John McCarthy & Sons, of Syracuse, N. Y., lead in this line, having used one for some time, and now one of his Syracuse competitors has joined the ranks and installed a gasoline one for public and private service. These few examples indicate the suitability of the motor car for such work.

Other fields, for the municipal operation

of the automobile, are the use of water commissioners and their staffs who are required to make an almost daily round of the city reading meters, superintending the construction of water mains and attending to the turning on and off of the supply; street inspectors, whose duties require them to traverse all parts of the city, where street improvements are being carried on or where inspections are to be made; heads of electric lighting departments, who have their daily city excursions and in addition can be noted the almost numberless city officials, such as mayor, aldermen, sanitary boards, surveyors and others whose duties compel them to be in many different parts of the city on the same day. To all of these officials the motor car is well adapted; when in use it goes quickly on its mission and when idle it neither requires attention nor fuel.

The city of Springfield, Mass., the home of the air-cooled Knox automobiles, while small in comparison with the population of many other eastern cities, leads in the use made of automobiles by city officials and other men in public positions in the city. This may be owing to the fact of Knox cars being made in the city, but yet in other places where automobiles are manufactured the city officials are not so quick to use the motor car as has been the case in Springfield. Among the officials using cars, all of them being Knox made machines, can be noted City Marshal George M. Stobbins, with his motor patrol and ambulance; E. E. Stone, chairman of the water commissioners; A. A. Adams, superintendent of streets; Charles E. Ladd, superintendent of parks, and to this list can be added A. H. Yunker, superintendent of construction of the United Electric Light Co., whose interests in this work are closely associated with city enterprises, and J. E. Converse, superintendent of electric lights.

All of these officials have used the motor car for periods varying from 3 months to as many years and the verdict of all is the same, "The automobile is much better and cheaper than the horse for our work." One and all of them have had the experiences common to pneumatic tires, flooded carbureters, broken spark plugs and burnt-out coils, yet in spite of these few looked-for occurrences, the motor car has sufficient merits to offset any little irregularities of running that come.

George M. Stebbins, city marshal of the city of Springfield, Mass., has used an automobile patrol and ambulance for the last 9 months, during which time the vehicle has covered 4,419 miles at a total cost of $256.58, being an operating expense of 5.81 cents per mile traveled. Marshal Stebbins, in speaking of the success of the automobile patrol and ambulance to a MOTOR AGE representative recently, said:

"That automobiles have come to stay is nowhere better demonstrated than in their application to the commercial life of the street and the speed with which large vans of merchandise are transported from place to place. This has led to the introduction of the automobile police patrol. In the year 1904 the police commission of this city placed an order for such a vehicle with the Knox Automobile Co. for the city of Springfield. This was completed and placed in active service about February 1, 1905. The automobile police patrol is propelled by a two-cylinder Knox engine estimated at 16 horsepower and a carrying capacity of fourteen persons. It is fitted so that it can be used as a police patrol or an ambulance, and has been used in the latter capacity in all emergency cases since its introduction. During the time it has been used in this department, covering a period of about 9 months, it has covered a mileage of 4,419 miles, at an expense, including repair, of $256.58; doing the work of two horses.

"Comparing the cost of keeping and shoeing horses, and repairs on harness and wagons, as a matter of economy of maintenance the comparison is in favor of the automobile. This, however, is not the essential consideration. The quickness and dispatch with which the work is conducted, even though the expense was greater, is an essential element to be considered. Several instances have occurred where from a humane standpoint the automobile has more than satisfied the promoters of the idea of using an automobile for police and ambulance work. One instance I note, which occurred a few months ago. A large touring car collided with a farmer's wagon in the suburbs of the city, some 3 miles distant from the police station, dangerously injuring one of the occupants. A telephone summoned the automobile police patrol. Upon its arrival the injured man was placed on a stretcher in the patrol, taken to the hospital about 4 miles from the place of the accident, and after leaving the patient at the hospital the patrol returned to the station. The time occupied from the receipt of the telephone call until the patrol had returned was 35 minutes. The whole distance covered was 8 miles. This is only an illustration of the daily work of the automobile police patrol in this city. The reliability of the machine for service is excellent. It has never failed us as yet, except for some momentary adjustment, and that but a very few times. With the record of the machine for the past 9 months, its readiness for service, the quickness and dispatch of the same, and its economy compared with the use of the horse patrol and ambulance, the promoters of the introduction of the automobile police patrol and ambulance are more than satisfied with its success."

The Springfield Electric Light Co. has purchased two runabout machines for the use of superintendents of lights, at night, and construction work by day. Both of these runabouts are specially fitted for the work, having light carrying spaces for repair parts or small tools. One of them has come under the supervision of Mr. A. H. Yunker, superintendent of construction, who, in a recent conversation expressed himself in the following terms on the adaptability of automobiles for such trying service:

"We have used two single-cylinder Knox cars for the last 10 months, making a mileage of 27,600 for both machines. These cars were originally designed to

CHARLES E. LADD, SUPERINTENDENT OF PARKS OF SPRINGFIELD, MASS., WHO USES A KNOX FOR BUSINESS PURPOSES

Digitized by Google

MARSHAL STEBBINS AND THE SPRINGFIELD POLICE PATROL WAGON

carry some little weight and have room in the body for a small load. We have used them as runabouts, however, patroling street lights during the nights and following our construction work by day, so our economy has perhaps not been as good as it would had we a light runabout. We use approximately 1 gallon of fuel for 9 miles of running and the average cost per mile has been $.058, including all repairs and renewals, but not driver, depreciation or interest. We have had very little tire trouble, the principal fault being sand blisters caused by sand working through cuts in the tread and packing in between the same and the shoe causing the tread to break. These cars average 90 miles per day and it is almost impossible to compare them with a horse. We would say, as a low estimate, that these machines have replaced six horses and would add that we used them all last winter with the exception of 1 week of soft snow."

"The runabout purchased in May, 1904, of the Knox Automobile Co., of this city, by the city of Springfield for my use," said A. A. Adams, superintendent of streets, "has given excellent satisfaction. In all, I have probably driven it more than 10,000 miles and it works today fully as good as when first used. I would say that I had considerable trouble with tires last year, but have had no such trouble this year. It has required 1 gallon of gasoline to run 11½ miles and the machine does more work than could be done with two horses."

"We have used in the water department," said E. E. Stone, chairman of the Springfield water department, "for the past 2 years, a single-cylinder model E Knox runabout. This has been in continual service, and largely on rough country roads, on work at such a distance from the city that it would have been impracticable to use horses, and it has given us good satisfaction during all that time."

A NEW YORK DELIVERY

R. H. Macy & Co., dry goods merchants of New York city, use fifteen electric delivery wagons in the delivery of their goods throughout the city. In speaking to a member of the concern recently a Motor Age representative received information on the running of the machines. The fifteen wagons average 26 miles each per day, some, however, do 35 miles regularly every day, while others, owing to the nature of the work, drop a little below the average. Two and often three deliveries are made over the same district every day, the weight of the loads on the different trips and over the different routes varying all the time. Three thousand pounds have been carried on the wagons on many occasions. The power consumption for each vehicle amounts to .75 kilowatts per mile. As with all other delivery wagons the tire question must not be forgotten. Some of the tires endure all the way from 1 year to 18 months, the rear tires generally running 12 months and the front serving for 1½ years. In comparing the delivery wagon with the horse-drawn wagons it has been found that each electric performs the work of one-and-one-half horse wagons, meaning 50 per cent increase in work over the horse. Macy & Co. have found the electric vehicle serviceable to a certain extent in their business, the extent depending entirely on the efficiency of the battery, which they claim varies greatly with the temperature.

GERNSBACH VAN THE STAR

Honors in the van and omnibus trials of the Automobile Club of Germany, held over a course extending from Berlin to Spandau, from October 9 to 14, inclusive, were carried off by the omnibus entered by Gernsbach, of Baden, which finished first on each day's journey. The official winner, however, has not yet been declared, the German officials having taken the matter under advisement. The Gernsbach machine, or the single-deck Safe, as it is better known, is an omnibus carrying thirteen people, the wheels being fitted with solid tires in the rear and pneumatics in front. It was put in commission only on

A. A. ADAMS, SUPERINTENDENT OF STREETS, SPRINGFIELD, IN A KNOX CAR

by Google

DAIMLER THIRTY-PASSENGER BUS

BUSSING TWENTY-SEVEN PASSENGER BUS

October 6. Twelve out of the thirteen cars that started finished, the laggard being the old beer van entered by the Daimler people, which has been knocked about over the rough cobblestones of Berlin's streets since 1898.

The competition was divided into classes for the heavier and another for the lighter machines. The ponderous vehicles being regarded as light-winded, were given only about 290 miles to make in the 6 days, while the others were required to do something like 421 miles in the same time. At the last minute the committee made its first trip over the route for inspection purposes and then made several slight alterations, which, however, did not work any very great hardships on the contesting machines in the several classes.

Two of the original field were scratched, but reenforcements were received in the shape of a Daimler two-cylinder, 10-horsepower alcohol-driven milk van and a 10-12-horsepower two-cylinder spirit engine N. A. G. van, shod with pneumatics. H. Rosenthal's van was one of the absentees, while the other was a steam van nominated by Garrett, Smith & Co., of Magdeburg. This last concern scratched for the very good reason that the day the trials started they filed a declaration of insolvency for the sum of $1,000,000. In class I the Daimler people withdrew their bus seating twenty-three people and substituted one with 18 horsepower instead of 25 and carrying thirty-two people, while the Daimler originally in class IV was reduced in weight and put in class III.

Early on the morning of the 9th the field was sent away, an official observer being in each car. His duty was to report each day on the vehicle's working, reliability, smoothness or otherwise of traveling, degree of annoyance through noise or smell, consumption of combustibles, repairs necessary and time taken for them, etc., etc. The observer was also held responsible for any violations of police regulations en route.

Hardly had the caravan gotten away on the first day's journey before it started to rain, but this did not prevent eleven of the rigs completing the journey of 60 miles to Gransee. The first in was the Gernsbach omnibus, which did its stunt in less than 4 hours 30 minutes. By 3 p. m. the other ten had registered. The beer van got into trouble through a defective steering gear and stuck, while the Daimler van for 6,600 pounds smashed into a tree and broke an axle. The beer van, however, was ready to start in the next morning on the Gransee-Neu-Brandeburg stretch, a distance of 76 miles. Here again the Gernsbach put it over its rivals, reporting within 5 hours after the start, having averaged 15 miles an hour.

Fine weather favored the contestants on the third day and the Gernsbach proved that it could travel on dry land as well as it could through the mud by reaching Gnoyen first. This day's journey was 65 miles for the light-weights and the Baden rig negotiated the distance in 3 hours 37 minutes or 17½ miles an hour. The Daimler which broke its axle the first day had patched up so as to be able to keep in the running and it surprised the others by finishing a good second to the apparently invincible Gernsbach. It was a tough pull on the fourth day between Gnoyen and Goldberg, especially for those on the long course. The recent rains and the miserable work of the road-mender extended each rig to the utmost. It was 2:30 in the afternoon before three of the machines straggled in. Of course the Gernsbach was Johnny-on-the-spot, but this time it had company in the shape of the 3-ton Daimler and the N. A. G. delivery van.

Again on the fifth day were the contestants forced to fight the allied forces of the weather man and the road-mender. Old Boreas, too, joined in the war and this combination slowed down the entire field, so that 8 miles an hour was considered going some. At 3 o'clock that afternoon the Gernsbach turned up at Kyritz, having covered 68 miles in 5 hours 31 minutes. The others straggled in one by one, until at 7 o'clock all were safely housed, the observers' reports filed and everyone working to get ready for the last day's run to Spandau.

Keeping up to the reputation it established all the way through the contest, the Gernsbach crossed the finish line at 1:37 on the sixth day, with the others strung out miles behind it. But the stragglers came hiking along by and by, so that all were checked in with the exception of the old beer van, which foundered somewhere along the road and could not be set going again to get to the tape before the officials left and the race was over.

While nothing official has been announced, it would seem that the Gernsbach had won by a city block. Of course, it all depends on the reports filed by its observer as to whether or not its consumption of benzine was in favorable proportion to its speed.

Following on the heels of these van trials came the Frankfort motor exhibition, which opened on the 20th and lasted to the 29th. H. R. H. Princess Friedrich Karl of Hesse was the patroness and all the leading motor people of Germany exhibited their wares, prominent among which was the commercial end of the game.

GERNSBACH BUS, LEADER IN THE GERMAN VAN AND OMNIBUS TRIALS

Digitized by Google

From the Four Winds

START OF THE RECENT BALLOON RACE OF THE AERO CLUB OF PARIS

A. C. A.'s Membership Full—The Automobile Club of America has reached its membership, having now on its roll 700 active and 200 associate members. There is a waiting list of forty.

No Kickers Here—The Franklin people made a hit with New York users of their car by sending half a dozen experts to Gotham to call on each patron and if anything was wrong with his car put it to rights free of charge and with the compliments of the company.

Spends His Velvet—J. Wicks, who owns the property on which the grand stands were erected for the Vanderbilt cup race finish, cleared up so much money out of his many concessions at the trial and final that he has just got rid of a portion of the surplus by buying his first automobile, a 30-horsepower Pope-Toledo.

Test of Motor Guns—It is proposed to thoroughly test the automobile corps of the French army in the field maneuvers by having it attack the Lebaudy dirigible balloons. The motor cars will be equipped with light rapid-fire guns and searchlights and will follow the balloon, similarly equipped, and endeavor to put the air ship out of business.

June Time for Roadwork—Sidney J. King, pathfinder for the American Good Roads Association, after tracing a route in a Reo from Grand Rapids to Detroit, declares it to be his conviction that fall is not the proper time for the farmers to work out their road taxes. He believes that if the work was done in June the surface would have time to pack and work in so as to be impervious to the autumn rains and the spring thaws.

English Hold Secret Quiz—The motor car commission appointed by the English government to investigate the operation and working of the motor car act of 1903, with a view to its amendment and renewal, had its first meeting on Monday last. Its first proceeding was to decide that the press and public would be excluded from its deliberations, a fact which has taken a lot of the public interest out of the business. The commission is presided over by Viscount Selby and representatives from the local government boards of Scotland and Ireland. The chairman of the automobile club, the secretary of the Motor Union, the permanent official in charge of the working of the act at the local government board and others were examined, but what they said and what they did history sayeth not.

Queen Finishes Tour—Dowager Queen Margherita of Italy has just returned to Turin after a journey of 5,000 miles in her automobile through Switzerland, Germany, Holland and France.

King Is Generous—The king of Italy has hung up $7,000 in prizes to be distributed among the exhibitors at Milan's international exhibition next year. Among the prizes is one for $1,000 to be awarded to the best motor boat.

Jolly City Fathers—To show their appreciation of the paved streets movement in Muskegon, Mich., the automobile owners of that city recently gave the aldermen an automobile ride which ended with a banquet. The affair was in charge of Dr. C. J. Dove, president of the Muskegon Automobile Club.

Cripple Expert Driver—J. T. Landis, a reputed millionaire of Nashville, Tenn., who is deprived of the use of his legs, recently drove from his home to Springfield, Mass. He drove the car himself and averaged 175 miles a day. The brakes on the car are so arranged that Mr. Landis can operate them with his hands instead of his feet. On his tour he had his invalid's chair sent ahead of him each day for use when not in his automobile.

Phillies Wake Up—The Philadelphia Dealers' Association, after the summer's busy days, has come to life with a rush, and besides its effort to secure the use of the speedway has scheduled a hill climb, probably on Thanksgiving day, and a local show by its members, without the assistance of professional promoters. Runs and endurance and economy tests are being considered as means of keeping the interest alive in Philadelphia between seasons.

Beats Fish Story—Jackson county farmer found an automobile horn on the roadway recently and took it home and taught his chickens to recognize its honk as their feed call. Instead of calling the chickens in the usual way, the farmer or his wife would blow the horn. One day an automobilist in a car was driving by at the rate of about 15 miles an hour, all the time tooting his horn. The farmer's chickens took after the automobile and fourteen hens and three roosters ran themselves to death. And this story is in line with the one from Jersey, whereby an automobilist, honking his horn, attracted a flock of Canadian geese, and ran over and killed two of them.

Seeks New Home—The Automobile Club of Washington has taken quarters in the Colonial hotel on H street, the temporary quarters in the Villa Flora clubhouse having proved unsatisfactory. A suite of rooms on the second floor has been engaged and the club expects to take possession within a week.

Start of Balloon Race—Doubtless the members of the Aero Club, of America, of which organization many prominent motorists are a part, will take an interest in the photograph of the start of the recent balloon race of the grand prix de l'Aero Club of France. Seventeen of the air monsters took part in the competition, seven countries being represented.

On Long Ramble—G. M. Huston and his wife and son of Chicago, were reported at Charleston, S. C., last week on a rambling tour through the south. They have been on the road since last April and the odometer showed 17,321 miles at Charleston. Their trip has taken them through the east, where they spent the summer at Atlantic City. It is their intention to continue their trip until Mr. Huston's winter home in the southern part of South Carolina is reached.

Bald Aids Cupid—Eddie Bald assisted a newly married couple out of a rice-throwing onslaught when he secretly whirled Mayor and Mrs. Cavanaugh, of Norwalk, Conn., over the road to New Haven from Hartford in the car in which he broke the 5-mile record. The wedding was the largest one of the fall season in Hartford. The couple went into a carriage only to pass out the other door and into Bald's car. Though 42 miles separates Hartford and New Haven, Bald landed Norwalk's mayor and his new bride on the college green in 1 hour 7 minutes.

Red Cross No Protection—Mayor Dunne, of Chicago has ruled that the red cross does not make immune from arrest physicians who violate the speed ordinances. The horse-drawn vehicles he declares to be in a different class, because at their top speed they are not dangerous, while motor cars, if allowed unlimited freedom, would endanger the lives of pedestrians. The mayor holds that even if a doctor is hurrying to a sick man's bedside record-breaking speed is not permissible and that the patient will have to take his chances in order that others may not be placed in jeopardy.

Wolverines Are Shy—Either the number of automobiles in Michigan was greatly overestimated or a large number of car owners have failed to comply with the state law requiring the licensing of automobiles, as only 2,700 licenses have been taken out at the office of the secretary of state. It was estimated during the session of the legislature that at least 5,000 machines were owned in Michigan. The license fee of $2 on each machine goes toward the support of the department of good roads. The enforcement of the law requiring the license fee lies with the state authorities and if police departments do not require the payment of the fee it remains unpaid.

Long Run—One of the longest trips a-motor to the Vanderbilt cup race was that of John A. Landis, of Nashville, Tenn., who made a journey of 1,430 miles in his White steamer by way of Cleveland and Buffalo.

Garage for Gas Man—Thomas Dolan, president of the United Gas Improvement Co., is now having a private garage built at his country place at Torresdale, a suburb of Philadelphia. The structure will be 33 by 28 feet in dimensions, and Stacy Reeves & Sons are the architects.

Makes Them Cough Up—Automobiles have been used in the campaign at Syracuse this year for the purpose of seeing politicians who are supposed to have money and making them loosen up. The machines have been scooting to every part of the city and it is impossible for a prospective contributor to escape.

Automobile Studio—R. L. Sleeth, Jr., an enterprising photographer of Wilkinsburg, Pa., the largest suburb of Pittsburg, has taken a unique way of getting business. He takes orders by phone, carries a complete photographic outfit for almost all kinds of work with him in his automobile and does all the work except the finishing touches away from his office.

Champion Car Owner—Claim is made that Colonel John Jacob Astor is the champion automobile owner, maintaining a stable of twenty cars reputed to be valued at $100,000. It is said it costs him about $15,000 a year to maintain this string, not counting salaries of chauffeurs, storage and fuel. Jefferson Seligman has had fifteen cars, while C. K. G. Billings, gas magnate, has twelve gasoline cars and one electric.

Clash with Horsemen—There's going to be a regular talkfest in Quakerville soon, and any one interested enough to do so can, by putting his ear to the ground, hear the rumble of approaching trouble. It is all owing to the members of the Philadelphia Automobile Dealers' Association having decided at its last meeting to petition the Fairmount park commissioners to grant them the use of the new speedway for a day or two each week. As the speedway is practically abandoned by the horsemen for 5 days of the week, it will be a triumph for the latter's dog-in-the-manger policy if the automobile owners are not permitted to burn up the new road for several hours at least one day in the week.

Quakers Celebrate—One of the most interesting features of Philadelphia's night parade to celebrate the winning of the American league baseball pennant by the champion Athletics was the large number of automobiles in line. As soon as the Quakers won the deciding game from Washington—the parade feature had been decided upon earlier—Manager W. F. Smith, of the local Rambler agency, made a ten-strike by offering the champions and the officials the use of ten machines. The offer was promptly accepted, and the next day the Winton, Reo, Acme, Ford, Maxwell, Packard, Yale and other representatives made similar offers to the committee in charge of the affair. Each of the six divisions of the parade—and it was a huge affair—was in charge of one of the local newspapers, and in each fully a score of automobiles were lined up, all handsomely decorated and illuminated. The Evening Telegraph took advantage of the occasion to put on the street for the first time the first of its electric delivery wagons. At present the Telegraph has no fewer than sixty-five horse-drawn wagons employed in this work, and it is believed that with a battery of twenty-five motor vehicles the same work can be done in a shorter time.

Fast Test—Ted Finch, of the Pungs-Finch Automobile Co., of Detroit, tested out a model F car by driving from his home city to New York to see the running of the Vanderbilt cup race, making the 880 miles, he claims, in 48 hours, his route taking him through Toledo, Cleveland, Buffalo, Geneva, Seneca Falls, Syracuse, Albany, Poughkeepsie and the east bank of the Hudson river to New York.

Chinese Student—Chan Hoey, a Chinaman, is in the Olds factory learning the game in order that he may return to his native land a full-fledged automobile expert. He is also way up in electricity, having been connected with several big concerns in that line. He has been in the country 8 years and expects to go home in 2 months and start a general electrical and repair business in Canton.

Twelve Cars in Athens—In view of the rapid growth in the demand for first-class automobiles and the remarkable success achieved in their construction in this country, the following data about automobiles in Greece will give American manufacturers an idea of the demand in that part of the world. At the present time there are twelve automobiles in the city of Athens. Three of these belong to the king and the princes. His majesty's car is quite a luxurious affair, and cost about $4,000. That owned by Prince Andreas was presented to him by the czar of Russia. Most of the automobiles in use in Athens were purchased in France at a cost of from $772 to $1,930. Three new ones are now on their way to Greece. Automobiles are classed by the tariff law as four-wheeled carriages, which, upholstered or not, used or unused, pay a duty of $57.90 each, besides octrio, etc. In the case of a high-priced carriage, with sumptuous furnishings, duty is assessed on value declared in invoice and bill of lading, and importers are advised to obtain an invoice from the Greek consul in the country from which shipment is made. In this latter case the duties are 20 per cent of assessed value, $25 octroi, and 5 per cent on the 20 per cent.

Spreckles an Enthusiast—John D. Spreckles, the sugar king, is one of the most enthusiastic motorists on the Pacific coast. On one of his recent trips from San Francisco he had in his White steamer Miss Grace Spreckles and Mr. and Mrs. Wakefield Baker.

Active Consulate—It is reported that the Pittsburg consulate of the American Motor League has been doing good work in the smoky city in the way of working for highway improvement and getting after the miscreants who threw broken glass in the streets.

Bus for Servants—Mrs. George L. Carnegie has lately received at her winter home in the south a 1-ton Waverly electric truck arranged so that seats can be placed along the sides, turning it into a bus. It will be used for transporting her servants and supplies from the station to her winter home at Plum Orchard, Fernandina, Fla.

Ohio Roadmen Organize—At the good roads convention held at Toledo, O., last week a very excellent program was given. A permanent organization was formed with A. L. Spitzer as president, C. W. Shoemaker first vice-president, J. L. Pray second vice-president, J. W. Flowers secretary and R. A. Bartley treasurer. Vice-presidents were also selected for each one of the sixteen townships in the county. The organization will hold another meeting on November 11.

French Dissatisfied—It is reported from the continent that owing to the small amount of interest taken in the fall meetings held around Paris that it is likely that there will be a general reorganization of the program in the future. Chateau Thierry, Dourdan and Gaillon were promoted for the purpose of enabling makers to test their cars before exhibiting them in the Paris show. But all makers are not testing their new machines in this manner and the others object to meeting old cars in such competitions.

JOHN D. SPRECKLES, THE SUGAR KING, AN ARDENT AUTOMOBILIST

Digitized by Google

AMONG MAKERS AND DEALERS

Takes on the Corbin—J. S. Bretz, while in Chicago, placed the agency for the Corbin car with the Bennett-Bird Co.

Dyke Resumes—The Phoenix Automobile Supply Co. has bought the stock of the Auto Exchange & Supply Co., of St. Louis, and will continue the business at 3939 Olive street. A. L. Dyke is the manager of the concern.

Howell Well Fixed—R. G. Howell, recently of the Harrolds Motor Car Co., of New York, has just been installed at the head of the Franklin department of the Decauville Automobile Co. He will have under him three assistants in addition to a Brooklyn representative.

Change of Name—George E. Hawley, formerly secretary of the Automobile Equipment Co., has purchased an active interest in the Gray Mfg. Co. of Detroit, and the name of the concern has been changed to the Gray-Hawley Mfg. Co. It will make mufflers, autochimes and marine whistles. A change in location has been found necessary and the plant is now at 605-9 Fort street.

Quaker Change—The property at the northeast corner of Broad and Race streets, Philadelphia, has been leased by Foss & Hughes, who recently acquired the agency for the Pierce and Cadillac machines for the Quaker City and vicinity. A large force of carpenters, painters and decorators is now at work beautifying the place, which is admirably adapted for the purpose, having good-sized fronts on both streets.

Clever Student—Edward Moore, of Newburgh, now a student at Syracuse university, has, it is reported, just received a check for $5,200 for his invention of an improvement in a gas engine sparker. The new device switches the current which runs the sparker automatically when the gear lever is operated. This does away with an extra operation. Moore is a freshman. Before going to college he was, it is said, paid $8,000 for a combined starter and regulator for electric motors.

New Concern—The Auto & Power Appliance Co., with offices at 357-359 The Arcade, Cleveland, O., has been recently organized for the purpose of manufacturing and marketing a line of motor vehicle parts and power appliances. The officers and directors of the company are all Cleveland men, as follows: E. L. Russell, president; J. A. Krider, vice president; F. C. Schneerer, secretary and treasurer; directors, J. Arthur House, F. A. Richards, E. L. Russell, F. C. Schneerer, J. A. Krider, G. F. Ball and C. E. Thompson. The company is incorporated under the laws of Ohio, with a capital stock of $200,000. This company has acquired the rights of manufacture from the Industrial Engineering Co. to a line of motor vehicle parts. In addition to manufacturing and marketing its own apparatus, it is the purpose of this company to solicit contracts from other companies for the manufacture of motor vehicle parts.

Another Ohio Factory—The Lehr Agricultural Co., of Fremont, O., will have a new touring car of 20 horsepower on the market the first of the year, the company just recently deciding to go into the manufacture of automobiles.

Fahey Fixed—Ed Fahey, brother of Tom Fahey, of the Locomobile company, has been appointed to the direction of the Boston branch house of Continental tires. Fahey takes up his new work November 1. For the past year Fahey has been attached to the Hartford sales department of the Electric Vehicle Co.

On Demonstration Tour—George D. Wilcox, in charge of the car of the Gearless Transmission Co., of Glen Falls, N. Y., which is making a demonstration trip through the west, spent last week in Detroit, from which city he started out to go through Michigan to Chicago, Indianapolis, Columbus and Cleveland and then to New York. He expects to make the metropolis by November 20.

Parish Promotes—Robt. E. Jennings, of the Carpenter Steel Co., of Reading, Pa., will be president of the new company being organized for the purpose of manufacturing automobile frames made of nickel chrome steel. J. E. Sullivan will be one of the officers. The general manager is to be Neff E. Parish, organizer of the Parish & Bingham Co., of Cleveland. The name of the new company has not been decided on, but it will probably be the N. E. Parish Mfg. Co.

After New Store—The business done in Philadelphia during the past season by the local branch of Thomas B. Jeffery & Co. has demonstrated the inadequacy of the present quarters at 242 North Broad street. Manager W. F. Smith has been on the lookout for larger quarters for some time and is now dickering for a place which, if the negotiations go through, will give the Rambler the most palatial home on the row, it is claimed. Should the deal fall through, the present quarters will be enlarged and improved to the limit of their capacity.

Scots to Make Aster Motors—On top of the Darracq expansion as an assembling concern in England comes news of an arrangement between the Argyll company of Glasgow and Asters, the big French motor manufacturers, whereby the Scottish firm will manufacture motors for the English branch of the concern. The Argyll cars have been fitted with Aster engines for some years now and the arrangement is, no doubt, the outcome of initial confidence and satisfaction. Its underlying reason is probably a desire to get Aster goods on the colonial markets under the preference which is given to all British-made goods, besides which the colonial is averse to purchase foreign cars whose replacement will be difficult and take an exasperating length of time to obtain. How this arrangement with the Argyll concern fits in with the acquisition by Asters of 5 acres of land in the northwest suburbs of London for the ostensible purpose of erecting a factory to produce Aster motors is difficult to see.

Old Kirk Plant Sold—The automobile plant of the Kirk Mfg. Co., of Toledo, O., the property of which recently went into the hands of the Consolidated Mfg. Co., was last week sold to a Cleveland firm which will manufacture burial vaults.

Costly Button—It is declared that at Madison Square Garden there will be no wholesaling of trade tickets as at previous shows, and no coupon books. A badge or button will be given to employees of exhibitors when properly vouched for and additional buttons in case the original ones are lost will cost the unlucky one $5 each.

After Duryea Plant—Efforts are making to induce the Duryea Co., of Reading, Pa., to establish a marine motor factory, garage and repair shop at Pleasantville, N. J. Since the opening of the new boulevard across the meadows to Atlantic City, about 5 miles distant, the Pleasantville board of trade has begun to realize that a big automobile plant would boom its town immensely. If the deal goes through the plant will be located on the new road.

Renault Models—C. A. Tileston, president of the company handling the Renault in America, has just returned from France, where he spent 1 year in the works of Renault Brothers at Billiancourt. He brings back with him the information that the models for 1906 will include a 20-30-horsepower and a 14-20-horsepower four-cylinder machine, an 8-horsepower and a 10-14-horsepower two-cylinder cars, as well as a 40-50 horsepower model.

England's Second-Hand Trade—The extent of the second-hand trade done in the United Kingdom is indicated in the return of the business done by the motor house in Euston. It is certainly the largest of England's second-hand dealers, but that one firm should be able to turn over $1,271,734.96 worth of second-hand motor cars in 12 months is indicative of the volume of business done. The number of cars sold was 1,897, so that the average price is easily seen to be low, but it will be lower next year, it is expected.

Strict Show Rules—For the dealers attending the Madison Square garden show a new registry plan has been adopted which will enable them to visit the exposition without charge up to 11 o'clock each day, but which will prevent others from securing the same privilege. Upon entering the first day a dealer will be required to sign the registry book and also sign his name on the back of his card. To come in the next day he will have to again sign his name, which must be the same as the signature on the back of the card. The idea is to prevent other than

Digitized by Google

legitimate dealers from securing special privileges at the big exhibition.

Durphy with Columbia—W. H. Durphy, formerly manager of the Boston branch of the Deeauville company, is now located with the Columbia people of Hartford, it is reported from the east.

To Make Goggles—The Ophthalmuscope Co., of Toledo, O., which began manufacturing goggles for engineers and firemen about 2 years ago, has decided to equip a plant of its own at once. L. Bateman, manager of the concern, has decided to go into the manufacture of goggles for automobilists, two patterns having been gotten out.

Snap for Chauffeurs—The Banker Bros. Co., of Pittsburg, has decided to provide for the comfort of its chauffeurs by furnishing them with a big lounging room. On the second floor of the new addition a room has been fitted up for the use of all drivers connected with the garage. There will be a billiard table, an abundance of reading matter and pictures and plenty of comfortable lounging chairs.

A Franklin Test—A 1,000-mile test has just been completed by the H. H. Franklin Mfg. Co. One of its model G cars rated at 12 horsepower was used. On the trip the car carried, in addition to the driver, a baggage load of over 1,000 pounds. The test took place over a course from Syracuse to Albany, then to Boston via Pittsfield over the Peru mountains to Worcester, then from Boston to Providence, then to New York, thence up the Hudson to Peekskill and via the Catskills home.. No repairs or adjustments were made to the car en route, it is claimed by the demonstrators.

Baker Gets the Premier—S. H. Baker, for several years identified with the Boston branch of the Rambler company, has secured the local agency for the Premier and has organized a company.

In for Himself—Johnny Wells, formerly of the Philadelphia Rambler branch and later connected with the Packard and Autocar agency there, has embarked in an automobile livery business in the Quaker city.

The Franklin Outlook—The H. H. Franklin Mfg. Co., of Syracuse, N. Y., has, it is asserted, already contracted for one-half of its output for the coming season. The sales manager, C. Arthur Benjamin, is taking a trip through the New England states in the interest of the company. Several improvements are being made at the plant, among which are the erection of a lodge for employes and others who have occasion to enter and leave the works in an automobile.

Winton Changes Agents—As a result of the Winton exhibition car's trip through the country Charles Shanks has made some changes among the Winton representatives in the larger cities. In Buffalo the Winton is now handled by the Centaur Motor Car Co.; in Newark, N. J., the agency has been placed with C. S. Calvert; in Pittsburg the Standard Automobile Co. has been retained; in Indianapolis the Indiana Automobile Co. succeeds the Fisher Automobile Co. as sales agent in Indianapolis and southern Indiana; in St. Louis the Western Automobile Co. has taken the agency for the Winton for 1906.

Henry Moves Up—David W. Henry, of Buffalo, has been made general representative of the Electric Vehicle Co. Mr. Henry will continue to travel with the Columbia line of cars and is now preparing for a trip from New York to San Francisco. He will have charge of the traveling salesmen, routes and agents in the field and will spend the larger portion of his time in Hartford.

Cutting's Idea—Gen. John T. Cutting, the new representative of the Olds Motor Works in New York, has conceived and will put through on election day a novel and ambitious scheme in celebration of the fifth anniversary of the introduction of the Oldsmobile in New York. It will combine a run, a race meet and a luncheon, with the addition of a drawing for an Oldsmobile runabout by way of a souvenir. The main events will take place at Empire track.

Change in Buick Plans—At a meeting of the directors of the Buick Motor Co., of Flint, Mich., it was decided to change the plans for its new building so as to provide a main building 350 by 64 feet in ground dimensions, with an east wing 250 by 64 feet and a west wing 100 by 64 feet, the change being made with a view to furthering the lighting facilities of the structure. The work of constructing the main building and the wings will be carried as far into the winter as the weather will permit.

THE INTERNATIONAL EXCHANGE

Washington Statistics—Interesting details of the import and export trade in automobiles and parts during September and the nine months ending with September have been made public. The compilations show that ninety-seven cars, valued at $349,622, and parts valued at $21,652 were imported during September, while during the nine months ending with that month 295 cars, valued at $1,065,458, and parts valued at $68,753 were imported.

Chance in South Africa—Mail advices state that among the many interesting lectures given before the British association at Cape Town, South Africa, was one in the engineering section by A. T. Hennessy, chairman of the Automobile Club of South Africa. There is no question that there is an enormous future for motor cars in South Africa, both for pleasure and commercial purposes. In Cape Town alone during the last 2 years the number of cars in use has more than doubled. The old battle of the steam car as the competitor of the internal combustion engine was again brought up at the meeting referred to, Maurice Hely-Hutchinson, son of Governor Hutchinson, who has a 15-horsepower White steamer, being a very strong advocate for steamers, but if well-posted automobilists are to be credited he does not know his South Africa sufficiently to realize the difficulties of water, to say nothing of the fact that what water is obtainable on the Karoo is usually so brackish that it has a bad effect upon the steam pipes. Chairman Hennessy, Professor Hele-Shaw and most of those who have had any South African experience strongly favor the gasoline car and consider it should be specially built for local conditions, which means that the wheels should be fairly high to allow of ample clearance from the ground, to avoid bumping and also for purposes of crossing drifts. The cars should be geared low in order to cope with the numerous hills that abound in some sections.

Tip to Exporters—A number of decisions bearing on the automobile import trade of the Australian commonwealth have been made, as follows: Motor parts of automobiles, when imported with the car to which they belong, shall be classified as vehicles and parts, not elsewhere included in the tariff act, dutiable at 20 per cent ad valorem. Otherwise they will be treated as machinery and appliances, not elsewhere included, electric, at 12½ per cent ad valorem. Rubber tires, when imported with the automobiles to which they belong, shall be classified as vehicles, not elsewhere included, and parts, not elsewhere included, dutiable at 20 per cent; otherwise as manufactures of india rubber, with 15 per cent duty. Accumulators, when an integral part of an engine for motor cycles, will be classified as machinery and appliances, not elsewhere included, electric, dutiable at 12½ per cent.

What They Want in India—The Belgian consul at Bombay calls attention to the extraordinary increase which has been taking place in the importation of automobiles into India. They are becoming more and more popular, particularly among the wealthy natives. In Bombay all types find a good sale, including luxuriously fitted coupes and victorias. The ordinary car seating four people is best in demand. Motor cycles are being introduced and seem likely to come rapidly into general use.

Swedes Take to Motoring—A French commercial adviser at Helsingfors, Sweden, reports that the use of automobiles has for some time past been increasing in the large towns of Sweden, such as Stockholm and Gothenburg, and that the present moment, when the fashionable world is evincing so much interest in the automobile, is a favorable one for attacking the market. Strong cars, moderate in price and with a simple but tasteful body, are suitable for the Swedish market. The cities offering the best opportunities are Stockholm and Gothenburg; then Malmo, which is a wealthy center. Norrkoping should not be neglected, as it is a rich town with excellent roads. As nearly all Swedish towns and villages are provided with electric stations, a good market could be found for electrics. Motor cycles have a good sale in the north of Sweden and Finland, consular reports show.

VIBRATOR TROUBLES

Chicago, Ill.—Editor MOTOR AGE—While running along Drexel boulevard recently I observed a pile of dirt ahead of me in the darkness. Realizing that a slight bump would be there, I closed the throttle, retarded the spark and applied the brakes gently without releasing the clutch. On going over the dirt there was a slight bump. Almost immediately the engine—double opposed—became sick and bumped along, not giving half its power. The motor was given gas, but no better results obtained; the coil was all right and so was the compression. A slight examination of the coil, however, revealed that one of the vibrators had stuck. A touch of the finger was sufficient to loosen it, when the motor at once regained all of its power. What caused the vibrator to stick to the end of the core? The same evening another driver stated that he had similar difficulties and was compelled to put several thicknesses of paper over the end of the core to prevent sticking of the vibrator. Can you give a reason for this and a better method of avoiding it?—R. P. C.

The armature sticks to the core because both are of material subject to magnetic attraction. If otherwise the spark coil would be an impossibility. Both are electro-magnets—that is, they are influenced only when the current is present. There is always some magnetism left when the current is off. This is called residual magnetism and with some grades of iron is greater than with others, often being sufficient to hold the armature to the core for some time. To prevent actual contact of the core and armature some makers cap the core with a brass ferrule; others have a stop, against which the armature strikes previously to coming in contact with the core. A piece of paper attached to the core with shellac will prevent contact, which is all that is necessary, as the residual magnetism is not of sufficient strength to hold the armature unless the parts are actually in contact. The experience is an impossibility, as with the armature on the core no spark would be produced, as will be shown. Referring to the drawing, A is the platinum-pointed adjustable contact screw, B is the vibrator and C is the core. When the circuit is closed the core attracts B and as B moves toward C the contact at the platinum points is broken. When this is broken the core C does not further exert an attraction on B and so B flies back and makes the contact, which reenergizes the core, pulls B and breaks the contact. These successive operations continue during the time the circuit breaker is in contact. The assumption is that B is stuck to C. Such being the case, the platinum screw and the contact on the armature do not touch. These not being in contact, no current can possibly get to the coil, so of course a spark cannot be produced. In all vibrator coils the same principle is involved; that is, that the armature breaks the contact before it touches the core. If this were not the case the vibrator would be inoperative. It being the case, it follows that when the armature touches the core the circuit remains broken. In view of the fact it is difficult to see how the experience is possible, as with the armature on the core the motor would be dead. The solution probably lies in the fact that one cylinder only was working, the other being dead through a sticking vibrator.

AUXILIARY EXHAUSTS

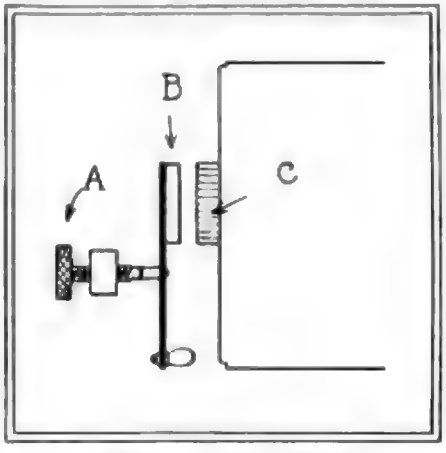
Chattanooga, Tenn.—Editor MOTOR AGE—In a recent issue of MOTOR AGE, when the Franklin air-cooled automobile was described, an auxiliary exhaust was said to be used near the bottom of each cylinder. This port, according to the description, was placed ¼ inch above the top of the piston when at the bottom of the stroke. I can't see how much of the exhaust will pass out through this opening, as it is uncovered by the piston walls for an exceptionally short period of time. The stroke of the engine is 3¼ inches and when running at 1,000 revolutions the piston travels 6,500 inches every minute, besides stopping at the top and bottom of the stroke 2,000 times. The auxiliary exhaust port is open only while the piston travels ¼ inch on the down stroke, stops at the bottom and travels ¼ inch up. What amount of gas can escape during this time? If a sufficient quantity does escape, I see no reason why the auxiliary exhaust would not be an excellent thing, but at present cannot see much practicability in it. At what rate of speed does the mixture travel when passing through the inlet valves in this machine, which are 1¾ inches in diameter and have a lift of 11-32 inch? The exhaust valves are the same size, and the auxiliary exhaust ports are 1 3-16 inches in diameter.—H. C.

The velocity of gas through the auxiliary exhaust port would depend upon the pressure at the end of the stroke, which is variable, depending upon the mixture, compression and spark lead. The object is to take some of the heat away from the hot cylinder and incidentally this practically reduces the pressure on the exhaust valve to atmospheric pressure. Without going too deeply into the question it is sufficient to say that if this auxiliary exhaust port did not reduce the cylinder pressure to atmospheric pressure during its short time of opening, the two cycle engine would be an impossibility, as its inlet and exhaust are both controlled by this means. Such speeds as 1,800 and 2,000 revolutions per minute are obtained from two cycle engines of the same bore as the Franklin and with but slightly larger exhaust port area than the Franklin auxiliary exhausts. If the pressure in the cylinder at the end of the stroke were not within 4 pounds of atmospheric no charge would enter and the motor would be inoperative.

INLET VALVE CONTROL

New Orleans, La.—Editor MOTOR AGE—What are the advantages claimed for controlling the speed of a motor by the inlet valves? Variation in some machines is accomplished by having cone-shaped cams on the cam shaft, so that the amount of lift given the valves can be varied from the seat. In other machines the opening of the inlet valve is restricted by air pressure. In both of these styles the carbureter is not adjusted while driving the machine, a fixed adjustment being made when the carbureter is attached to the car. The spark is advanced and retarded. Other machines are made so that the action of the inlet valves is not variable, but the throttle and spark are the only controlling means. Which of these systems is the better and what are the advantages and disadvantages of each?—J. E. E.

The first two systems are quite similar. Regulating the inlet valve lift, by either mechanical means or air pressure, throttles the motor close to the cylinder. It is acknowledged that this is the most advantageous position for a throttle. The third method, carbureter throttling, has the disadvantage of a considerable volume between the point of throttling and the cylinder. The mechanical variable inlet gives a very smooth and flexible motor, provided the variable mechanisms for each inlet are so constructed and interconnected that for all positions each valve opens exactly the same. With the air pressure system each valve must open the same, as the air pressure tending to keep the valve seated is the same on each valve, and the suction is the same. The condition for each to open the same depends upon each inlet spring having equal tension, each valve and its piston having equal frictional resistance to its movement, and the inlet valve pistons must fit alike. The conditions in both of these cases are easily fulfilled by correct design and manufacture of the parts.



AN ORDINARY COIL VIBRATOR

Digitized by Google

LEGAL LIGHTS AND SIDELIGHTS

ALIBI UP TO OWNER

Judge Utley, in the central district court at Worcester, Mass., at the close of the hearing in the case of the commonwealth vs. Chester W. Bliss, charged with violation of the automobile speed law in Leicester, made a ruling that the government is not required to prove the identity of automobilists violating the speed law. He said that an automobile owner, who is accused of illegal speeding, and who claims he was not in the machine when the laws were violated, must prove an alibi to be acquitted. Counsel for the defendant asserted that Bliss was not in his machine, and that the owner is no more responsible for the violation of the speed law with his machine by other persons than is the owner of a horse, wagon or other vehicle. A fine of $15 was imposed, but as Mr. Bliss was not in court, the sentence was postponed. In three other cases Contable Quinn was unable to identify the defendants as the alleged violators of the law, but the court imposed a fine of $15 in each case.

ATLANTA HAS A LAW

Atlanta, Ga., adopted its automobile ordinance, has been adopted by the general council and it now goes to Mayor Woodward for his approval. The ordinance provides principally for a board of automobile examiners, which will pass upon all applicants for licenses. It also provides that all present licenses become void within 30 days after the approval of the measure. Two amendments were placed upon the ordinance, one by Councilman Quillian, providing that all licenses expire on June 30 of every year, and the other by Councilman Bruce, providing that no automobile be operated by anyone who is under the influence of intoxicants.

AMEND MOTOR CAR MEASURE

Kansas City's new automobile ordinance was passed by the upper house of the council last week, with a number of amendments that make it necessary to send the ordinance back to the lower house. Before the ordinance got through the upper house the lower house adjourned. There is little probability that the lower house will concur in the amendments. In that event a conference committee will be called for and the amendments will then be thrashed over again. The amendments adopted by the upper house were briefly as follows:

Sections 3 and 4, providing for the licensing and examination of chauffeurs, were stricken out entirely.

That part of section 6 providing for the revocation of the license on the second conviction of violation of the ordinance was stricken out.

The eastern limit of the district in which the speed is limited to 8 miles an hour is extended from Troost avenue to Woodland avenue. The other limits of the district are the Missouri river, Eighteenth street and the state line. On the boulevards and elsewhere in the city the speed is restricted to 12 miles an hour.

On approaching and turning into intersecting streets the speed must be reduced to 4 miles an hour

Operators are not required to sound their horns on meeting vehicles coming towards them. It is required only on approaching vehicles from the rear.

The amendment eliminating the examination of chauffeurs was recommended by Aldermen Jewett and Woodson of the judiciary committee, who gave a hearing to the attorney and two members of the automobile club. The representatives of the club were willing to concede the changes in the speed regulations in return for the striking out of the license and examination sections. The machines themselves are subject to a vehicle tax under another ordinance. Alderman Sloan alone voted against this change.

TIMELY SUGGESTIONS MADE

Probably the most important announcement ever made affecting the interests of Washington automobilists was issued this week, when District Commissioner West, who has immediate supervision of the automobile regulations, informed President Duvall, of the Automobile Club of Washington, that it was the intention of the municipal authorities in the future to submit to the club all proposed amendments to the regulations, in order to obtain the views of those directly affected by any new regulations. This pleasing proposition of Commissioner West was brought about by a communication from H. C. Hunter, a member of the club, who suggested the advisability of incorporating in the local regulations a provision similar to that in force in New Jersey, making it a misdemeanor for any one, without the consent of the owner, to operate an automobile in the public streets and other places. Commissioner West thought this clause in the New Jersey law rather sweeping, and sent it to President Duvall with the request that the club should express its views on the subject. President Duvall, who is a lawyer, gave the matter careful consideration and finally proposed a substitute to the New Jersey clause as suggested by Mr. Hunter, to the effect that "any person who operates a car on the streets in the absence of the owner and without the written consent of the latter shall be guilty of a misdemeanor and upon conviction shall be punished by a fine of not less than $100 or more than $500, or imprisonment for 1 year, or both. Provided, that nothing in this statute shall be construed to prohibit the delivery of automobiles to points desired by the owner, or the return of machines from any point to the garage where same are stored, by a regularly licensed operator connected with said garage, provided that such delivery or return shall be accomplished by the shortest practicable route."

President Duvall set forth at length the wisdom of adopting the proposed regulation, and he likewise asked in behalf of the club that a regulation be adopted imposing a fine of from $50 to $500 upon any person willfully tampering with or destroying or damaging any part of an automobile, or taking away any of the lamps or parts of any automobile left temporarily on the streets or elsewhere.

The club is desirous of having a new police regulation enacted whereby heavy punishment can be inflicted upon persons who throw stones or sticks at passing automobilists. This is an evil that is growing in Washington and unless curbed by the police it will eventually lead to serious accidents. Still another evil that has caused much expense to automobilists is the habit of many persons throwing glass and other sharp substances on the streets.

CLAIMS CONFLICT OF LAWS

A test case is being made at Providence, R. I., of the law regulating the speed of automobiles. Philip E. Eddy, whose country house is at Rumstick Point, on Narragansett Bay, was tried recently in the district court at Warren for exceeding the speed limit of the town of Barrington last Sunday. John G. Aldrich pleaded guilty and paid his fine. Mr. Eddy didn't. R. B. Comstock, of Providence, counsel for Mr. Eddy, claimed that the ordinance regulating the limit of speed at 15 miles an hour conflicted with the general laws, and therefore Mr. Eddy committed no infraction. It was claimed that the town had a right to make an ordinance regulating the speed of automobiles without the compact part of the town, but no power to make an order regulating the speed within the compact part of the town, as that is regulated by the statutes. Judge Bosworth, reviewing the claims set up by counsel for the defendant, said that there appeared to be no compact section in the town of Barrington; that it was an open country and unlike Bristol or Warren.

DRUNKS BEWARE

With a view of getting after drunken chauffeurs and automobilists, State Senator Wood McKee has already drawn a bill for the next session of the New Jersey legislature, which will impose a fine of $1,000 on automobilists who may be arrested in an intoxicated condition. Senator McKee explains that he is inspired by the several automobile accidents of the past when a number of people lost their lives, through the carelessness of drunken automobile drivers. He wants the law so severe that drunken men will keep out of the machines, especially chauffeurs who take their owners' machines and wreck them. The bill reads:

"Any man in a drunken condition driving an automobile will be liable to summary arrest without warrant and will be liable to indictment and compelled to furnish bonds to guarantee his appearance when wanted. Should he be convicted the presiding judge will have power to send him to state prison not exceeding 3 years or impose a fine of $1,000 of both."

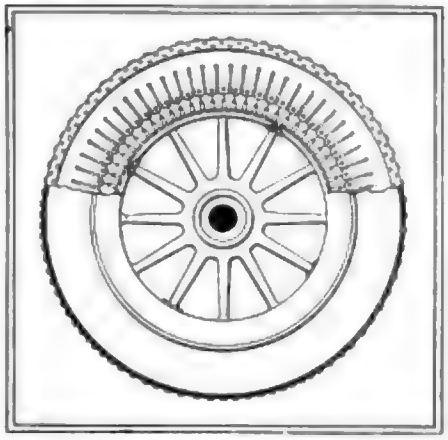
Current Automobile Patents

Boat Automobile—No. 802,852, dated October 24, to Edward Fournier, of North Yakima, Wash.—The inventor has a combined automobile and motor boat, the combination being such that should a portage have to be made, axles and road wheels can be quickly attached and the rudder and propeller removed. In case of traveling in water the road wheels are readily detachable and the rudder and propeller fitted in place; the propeller shaft from the gear case, being jointed, can easily be connected either with the propeller for marine use or the center of the rear axle for land traveling.

French Wood Tire—No. 802,746, dated October 24; to Auguste A. Gilles, of Nogent sur Marine, France. The inventor's wood tire forms part of the rim of any automobile wheel. On either side of the rim is a ring-like part made up of sections pivoted together at adjacent ends and with legs at the ends extending into sockets in the rim. The legs are bored, forming cylindrical seats, in which are placed coil springs for resisting jar. Between these two rings are block pieces composed of wood or any other material. These blocks are retained between the rings composed of the sections referred to and are free to move up and down as the wheel revolves.

Four-Wheel Drive—No. 802,442, dated October 24; to John A. Cary, of Denver, Colo.—The inventor has an automobile construction in which all four wheels of the car are used in driving. The motor is carried in any desirable position and drives to the axles through drive shafts that have journals in the framing of the vehicle. The front axle is of the pivotal type, steering knuckles not being used, and steering is through a steering wheel, a bevel gear on the bottom of the steering column driving a horizontal worm that works in a toothed quadrant in the frame.

Tire Covering—No. 802,755, dated October 24; to Pierre O. Casavant, of Point St. Charles, Quebec.—The inventor's cover for pneumatic tires is a chrome leather casing with a reinforced tread, consisting of an extra strip around the tread, of chrome leather, and in this strip are two or three series of heavy rivets with broad heads. The edges of the cover are serrated, long lips extending radially covering the sides of the tire. Just slightly nearer the center than the ring formed by the ends of the lips is a linked chain, not continuous but made up of four or five sections. To the links of this chain are attached the outer ends of hooks that engage with the inner ends of the teeth or lips on the cover. When tightening the cover in place the turnbuckles holding the several sections of the chain together are tightened, clamping the whole cover firmly in place.



CASAVANT'S TIRE COVER

Lamp Support—No. 803,846, dated October 24; to Joseph L. De Good, of Detroit, Mich.—The invention is a swiveled support for carrying the head and search lights of an automobile so that they will be turned in unison with the front wheels, the object of the invention being the lighting of the road directly in front of the automobile when turning corners. The lights are connected or supported on brackets, connected by rods with the tie rod between the steering knuckles.

Spring Wheel—No. 802,643, dated October 24; to Charles E. Huxley, of Chicago.—The spring wheel described has a sectional rim, the sections being of length to reach from the end of one spoke to the end of the next, where they are pivoted together and the spoke attached to one of the sections close to the pivot. The spokes consist of two tubular parts, one of large diameter attached to the hub and extending three-quarters of the distance to the rim, and the other part attached to the rim of less diameter, being within the larger part, the two parts being as a piston within a cylinder.

Gas Tire Inflator—No. 802,905, dated October 24; to Gabriel A. Borbick, of Los Angeles, Cal.—The invention relates to a method of inflating pneumatic tires, other than that by pump pressure. On the back part of the automobile, beneath the frame, is a cylindrical tank containing liquid carbon dioxide, and in conjunction is a water tank, by means of which the former compound can be made to give off gas. On the tank is a reducing valve attached to a flexible tube connecting the tire valves. In the tank containing the liquid carbon dioxide is space for the accumulation of gas, so that a pressure head can be obtained before starting inflation.

Gabriel's Horn—No. 802,386, dated October 24; to Claud H. Foster, of Cleveland, O.—The invention referred to is the Gabriel horn, now used on motor cars. The horn consists of three parallel tubes, similar in construction to organ pipes, with a reed in each. The tubes, or horns, are connected with the muffler pipe, so that part of the exhaust can be directed into the horn whenever desired. Arrangements between the horn and the exhaust pipe are such that when the exhaust pressure varies the horn produces a uniform musical sound.

Leather Tire Covering—No. 802,600, dated October 24; to Oliver D. Salisbury, of Owosso, Mich.—The pneumatic tire described has an inner air chamber and an outer casing made of leather. The outer casing has its edges adjacent to the wheel rim turned outward and holes in them for attachment to the rim. Beneath the tire is a bed strip on which it rests. This strip projects on either side beyond the rim of the wheel and has holes corresponding with those in the edges of the casing through which pass radial bolts secured to a metal ring encircling the wood rim.

PUNCTURE DETHRONES A KING

THIS is a kingly tale, a romantic sort of a recital of the woes of a monarch and how a revolution was decided on an island in the South Seas by the bursting of a rear tire on an automobile, which encompasses the downfall of a ruler of a dusky tribe of New Zealanders. While the story teller is no Richard Harding Davis, he is not half bad as a spinner of yarns and reels off his tale with a fluency that gives it a semblance of truth. As to whether or not he can back up his story with facts, that is not required of him. If it was, he could, no doubt, prove what he says by taking a map of New Zealand and pointing out exactly the location of the isle in question. That should be enough to satisfy the most exacting—particularly if the doubter is anxious to hear a good story. The man who stands sponsor for all that is to follow is credited with being a salesman for an automobile firm sent to the antipodes to work up trade there for American cars. He is not overanxious to divulge his identity. According to him, he went to New Zealand after a month's stay in Australia and while there made the acquaintance of the American consul at Auckland and was induced by the latter to go to Barren island, which is between Tasmania and New Zealand. The American consul accompanied him. The scenery of Barren island is the antithesis of its name and the Yankee consul promised that a trip in the automobile through the island would not prove a waste of time.

When the salesman and the consul arrived by steamer, which touches the island every 2 weeks, they found the country to be in the throes of a revolution. There was but one representative of British authority on the island, the steamship agent, and he cared little for the social and political problems with which the aborigines were wrestling, provided they permitted him to sit, clad in his duck suit, under an awning and enjoy his pipe in peace.

"The kin question," said the automobile drummer telling the story, "was the cause of the agitation, showing that the dusky-hued people differ but little from their white brothers. The half-clad king, who was well along in years, was at war in a small way with his only son who had recently come of age and who, in establishing his harem, had raided his father's enclosure and carried off three of the most buxom houris owned by the old man.

"Naturally the old gentleman was incensed at this purloining of his property, and with warriors, numbering about 150, had chased the son into a jungle. So hasty was his flight that he was forced to abandon his lares and penates and necessary attachments, including his harem. The old man in revenge made a clean sweep and took all of his son's portable possessions, including the aforesaid harem, to him own domicile.

"Considerable surprise was expressed by the natives at the gasoline automobile. They took to their heels when the monster came in sight and viewed it only from a safe distance. The only thing of a mechanical nature they had ever seen was the steamship."

Through the medium of the passive steamship clerk the salesman made the acquaintance of the son of the ruler who had left his jungle and had taken refuge in the little storehouse of the steamship company. The son and heir was induced to ride in the automobile under promise of protection from the wrath of his sire.

"Well, sir," said the American in telling his tale, "the few hundred natives on the island were so taken with this demonstration of courage by their ruler's son that they put it up to the old man good and strong. They said in effect that if he was afraid to ride in the automobile he would have to relinquish not only his war club but his assortment of wives.

"The old gent kicked considerably, but finally climbed into the rear seat of the machine. He was trembling and was as white as any black man could possibly get. I pushed the lever well forward and put on the second speed. I soon increased this to the third speed and pushed the throttle well forward.

"We were tearing along the beach before the populace of the whole island, who were scantily clothed, at a rate of 30 miles an hour, the old chief hanging on for dear life, when a rear tire burst.

"When I picked myself up 20 feet away I looked for the car and saw that it had run into the surf and was a total wreck. The next sight of interest that met my gaze was the old chief doubled up on the sand lying as still as a petrified log. He was clad only in his dignity, his few clothes having been torn from his body. Sea water administered externally in plentiful doses soon restored him to a painful memory of what had happened. There was no doubting as to who was the real king on the island after that. The people looked upon the accident as a demonstration of the wrath of their gods toward the old ruler and he was a back number thereafter. His son was compassionate and permitted him to remove his hut to the other side of the island. The old man, though, was forced to leave all his valued possessions behind, not even an houri being permitted to accompany him and do his cooking. It was an awful come-down for the ex-king, who can blame his downfall solely to the automobile, or rather to the tire. Had the old boy stood on his dignity he could not have done worse and would not have been branded as being on the bad books of the native gods. It was hard luck, I'll admit, but the son beat father to it in getting into the band wagon of modern progress, so he reaped the fruits of his daring in taking advantage of my offer. I took the next ship for Hobart, Tasmania, where I awaited the arrival of a sample machine from Melbourne, Australia, our nearest agency. If anybody asks you, just tell them I've had enough of the king business."

NEW ZEALAND NATIVES SCARED BY AUTOMOBILE

Digitized by Google

BRIEF BUSINESS ANNOUNCEMENTS

Sag Harbor, N. Y.—Liveryman A. K. Rogers is to sell his horses and open an automobile garage.

New York City—W. Irving Fickling, manager of the Auto Top & Cover Co., has been appointed agent for the Neuiport spark plugs and coils.

Detroit, Mich.—May & Wills, in the garage business at 11-13 Abbott street, have dissolved partnership. The business will be continued by David J. May.

Detroit, Mich.—W. C. Orell and Clark C. Hyatt have been appointed general agents for the Buick in Great Britain and Ireland. They will make their headquarters in London.

Troy, N. Y.—The Troy Automobile Exchange has testified to the secretary of state that the amount of its capital stock has been increased from $5,000 to $50,000, consisting of shares of $100 each.

Newport, R. I.—A repair shop at 86-88 John street has been opened by B. Morgan, who intends to carry on the manufacture of his patented single-piece inlet valves, as well as a general repair business.

Austin, Tex.—The Torreon Rubber Mfg. Co. has been incorporated lately with headquarters at Austin. The company is not a new one, but has already been supplying rubber to Germany and is now ready to extend the business.

Akron, O.—The Diamond Rubber Co. has increased its capital stock from $750,000 to $3,000,000. It is stated that the company will shortly make important additions to its plant in order to take care of the increasing demand for its goods.

Indianapolis, Ind.—The Fischer Automobile Co. has announced that it will handle several unlicensed makes of automobiles. It has the agencies for the Pope-Toledo, Oldsmobile and Winton, and in addition has arranged to handle the Premier, Maxwell, Stoddard-Dayton and the National in 1906.

Havana, Cuba—George Vernon Rogers, secretary of the Mitchell Motor Co., of Racine, Wis., recently spent some time in this city looking out for the interests of his company. The Havana agency for this concern has been turned over to the West Indies Transportation Co., of which Mr. Barnhardt is the manager.

Omaha, Neb.—T. M. Bromwell, for 2 years sales manager of the Rambler Automobile Co. of this city, has become vice-president and general manager of the Deright Co., which has been recently incorporated for $50,000, with J. J. Deright for president. The new company will begin operations about December 1.

New Albany, Ind.—The E. C. Walker Co. has sold a half interest in its business to E. C. Jacobson, of Louisville, Ky., and has erected a large factory at 1921-1923 Logan street, that city, where the company will continue the business of manufacturing the component parts of a steam car. In addition to this it will also manufacture a pneumatic shock absorber and a dust deflector.

Cleveland, O.—A. A. Stearns has placed contracts for the erection of a fine automobile garage at 401 Rosedale avenue.

South Bend, Ind.—The Tritt Electrical Mfg. Co. has removed to Union City, Ind., and is now established in the factory formerly occupied by the Union Automobile Co. in that city.

Toledo, O.—The Antler Stable Co., 120 Twenty-second street, has increased its capital stock from $25,000 to $50,000 and has changed its name to the Antler Stable & Garage Co.

Saratoga Springs, N. Y.—J. A. P. Ketchum has broken ground for a new garage to be built on South Broadway, south of Convention hall. The building is to cost $35,000.

Atlantic City, N. J.—Andrew P. Johnson is to erect an automobile garage that will cost $125,000 at 11 North Ohio avenue. Ground has been broken for the building and it is to accommodate fifty machines.

Detroit, Mich.—The Hayes Mfg. Co. expects to move into its new building early in November. Two brick buildings are being erected. E. A. Carpenter, until recently superintendent of the finishing department of the Packard Motor Car Co., has charge of the company.

Hammondsport, N. Y.—G. H. Curtiss is considering the removal of his factory to Rochester, where he will engage in the manufacture of his own motors. Until now they have been made by the Kirkham Motor Works, in Bath. The employees will be doubled and the factory considerably enlarged.

LATE INCORPORATIONS

Albany, N. Y.—The Automobile Supply Co. has been incorporated with a capital stock of $40,000.

Sharon, Mass.—The Tudor Farm Motor Car Co. has been incorporated with a capital stock of $15,000.

Columbus, Ohio—The Commercial Motor Trust Co. of Toledo has been incorporated with a capital stock of $20,000.

Trenton, N. J.—The Automobile Speedway Co. of New Jersey has been incorporated with a capital stock of $100,000.

New York—The Columbus Auto Exchange and Storage Co. of New York has been incorporated with a capital stock of $1,000.

New York City—The Alborak Auto Co. has been incorporated with a capital stock of $3,000. It will manufacture automobiles.

Hammondsport, N. Y.—The G. H. Curtiss Manufacturing Co. has been incorporated with a capital stock of $40,000. The company will engage in the manufacture of motors and motor cycles.

New York City—The Columbus Auto Exchange & Storage Co. has been incorporated with a capital stock of $1,000. The company is to maintain an automobile garage.

Albany, N. Y.—The Albany Garage Co. has been incorporated for the purpose of manufacturing, selling and storing horseless vehicles. The capital stock of the company is $50,000.

Aurora, Ill.—Articles of incorporation have been filed for the Practical Auto Co. with a capital stock of $100,000. The company will engage in the automobile manufacturing business.

New Brunswick, N. J.—The Middlesex Motor Co. of 95-99 New street has been incorporated with a capital stock of $50,000. It will manufacture automobiles, bicycles, bicycle parts and motor cars, etc.

Kansas City, Mo.—The Buick Motor Car Co., which will handle the Buick exclusively in Kansas, has moved to its new garage at Fifteenth street and Virginia avenue.

Lansing, Mich.—The Olds Motor Works has just shipped the first consignment of cars to its Paris agency. In the lot were seventy-five cars—four-cylinder, two-cylinder and runabouts.

Detroit, Mich.—The American Electromobile Co., with offices in the Penobscot building, is negotiating for a site on which to erect a factory for the manufacture of automobiles.

Pittsburg, Pa.—A two-story and basement building is to be erected by the Atlas Automobile Co. The building is to cost about $35,000 and will have accommodations for about 300 cars.

Kansas City—The Strang Electric-Gasoline Car Co., incorporated for $100,000, with A. F. Hunt, Jr., of New York as the leading stockholder, will build a combination gasoline-electric motor that can be used in commercial vehicles.

Cleveland, O.—The Standard Automobile Co., of Cleveland, has been formed with $10,000 capital stock by George H. Smith, F. B. Williams, M. G. McAlleman and George H. Kelley. The company will handle and repair automobiles.

Boston, Mass.—C. S. Henshaw, New England representative for the Thomas Flyer has closed with W. L. Wilcox at Fall River, Mass., and has renewed contracts with George J. Donahue, of Brockton, Mass., and the Reichert Automobile Station, of New Haven, Conn.

Cleveland, O.—The Brew & Hatcher Co., of Cleveland, which for several years past has conducted a factory for the manufacture of automobile parts and special material to order, has been succeeded by the Hatcher Auto Parts Co., Mr. Brew having retired from the company.

South Bend, Ind.—The W. L. Casaday Mfg. Co. has about concluded to drop automobile manufacturing and devote its efforts to the development of stationary gasoline engines. Mr. Cleveland, until recently manager of the company, has gone to California with the intention of taking up his residence there.

Kansas City, Mo.—Articles of incorporation of the Strang Electric-Gasoline Car Co. were filed with the county recorder. The capital stock of the company is $100,000. The company has patented a combination electric-gasoline motor power that can be employed in the moving of any class of vehicle designed to carry freight or passengers.

Muncie, Ind.—The new manufacturing company, to be known as the Muncie Auto Parts Co., has been organized with a capital stock of $15,000. The company is to make automobiles and automobile machinery of all kinds. It is expected that the manufacture of steering apparatus will be begun in a few weeks. Hugh L. Warner is to be the superintendent of the plant when it starts.

THIS LEAGUE
Is Now Collecting Route Information

covering all automobile routes in the important states and will publish road books for motor car users as fast as complete information is received. The A. M. L. is the only organization engaged in this work, and it involves the cooperation of all persons interested. For full information and membership blanks address American Motor League, Vanderbilt Building, New York City.

MORE STATE DIVISIONS

This week the division of six more states into districts is announced. The work of electing representatives from these districts to compose state boards of officers will be taken up during November, and the delegates to the national assembly will be elected in time for the February meeting, when the active work of the league will be extended in all directions. The divisions are as follows:

MISSOURI DIVISION

District 1, county of St. Louis; district 2, counties of Jefferson, Francois, Sainte Genevieve and Perry; district 3, counties of Madison, Wayne, Bollinger, Cape Girardeau and Scott; district 4, counties of Butler, Stoddard, Mississippi, New Madrid, Dunklin and Pemiscot; district 5, counties of Ripley, Oregon, Shannon, Carter, Reynolds, Iron and Dent; district 6, counties of Washington, Crawford and Phelps; district 7, counties of Franklin, St. Charles, Warren, Montgomery and Lincoln; district 8, counties of Audrain, Pike, Monroe and Rails; district 9, counties of Shelby, Marion, Lewis, Knox, Clark and Scotland; district 10, counties of Macon, Adair, Schuyler, Putnam, Sullivan, Mercer, Grundy, Linn and Livingston; district 11, counties of Randolph, Howard, Saline, Chariton and Carroll; district 12, counties of Boone, Callaway, Cole, Osage, Maries and Gasconade; district 13, counties of Miller, Pulaski, LaClede, Dallas, Hickory and Camden; district 14, counties of Texas, Howell, Ozark, Douglas, Wright, and Webster; district 15, counties of Taney, Christian, Stone, Barry, Lawrence, Newton and McDonald; district 16, counties of Greene, Polk, Cedar, Dade, Jasper, Barton and Vernon; district 17, counties of Saint Clair, Bate, Henry, Johnson and Cass; district 18, counties of Benton, Morgan, Moniteau, Cooper and Pettis; district 19, counties of Lafayette, Jackson, Ray, Clay, Platte, Buchanan, Clinton and Caldwell; district 20, counties of Daviess, DeKalb, Andrew, Holt, Atchison, Nodaway, Worth, Gentry and Harrison.

ILLINOIS DIVISION

District 1, county of Cook; district 2, counties of McHenry, Winnebago, Boone and Lake; district 3, counties of Jo Daviess, Stephenson, Ogle and Whiteside; district 4, counties of Lee, DeKalb, Kane, Kendall and Dupage; district 5, counties of Will, Kankakee and Grundy; district 6, counties of Bureau, Lasalle, Putnam, Marshall, Woodford, Peoria and Stark; district 7, counties of Henry, Knox, Warren, Henderson, Mercer and Rock Island; district 8, counties of Fulton, McDonough, Schuyler, Adams and Hancock; district 9, counties of Tazewell, Logan, Sangamon, Menard and Mason; district 10, counties of Livingston, Ford, DeWitt and McLean; district 11, counties of Iroquois, Vermilion and Champaign; district 12, counties of Edgar, Clark, Cumberland, Coles, Douglas, Mouldrie, Piatt and Macon; district 13, counties of Shelby, Christian, Montgomery and Macoupin; district 14, counties of Cass, Morgan, Greene, Jersey, Calhoun, Scott, Pike and Brown; district 15, counties of Madison, Bond, Clinton, Washington, Randolph, Monroe and St. Clair; district 16, counties of Fayette, Effingham, Jasper, Crawford, Lawrence, Richland, Clay, Marion, Jefferson, Wayne, Edwards and Wabash; district 17, counties of White, Hamilton, Gallatin, Saline, Hardin, Pope, Massac, Pulaski, Alexander, Johnson, Union, Williamson, Jackson, Franklin and Perry.

MINNESOTA DIVISION

District 1, county of Ramsey; district 2, county of Hennepin; district 3, counties of Dakota, Goodhue and Wabasha; district 4, counties of Dodge, Olmsted, Winona, Houston, Fillmore and Mawer; district 5, counties of Steele, Freeborn, Faribault, Blue Earth and Waseca; district 6, counties of Rice, Lesueur and Scott; district 7, counties of Nicollet, Sibley, Carver and McLeod; district 8, counties of Martin, Watonwah, Cottonwood, Jackson, Nobles, Murray, Pipestone and Rock; district 9, counties of Brown, Redwood and Renville; district 10, counties of Lyon, Lincoln, Yellow Medicine, Lac Quiparle, Chippewa and Swift; district 11, counties of Kandiyohi, Meeker, Wright and Stearns; district 12, counties of Anoka, Sherburne, Isanti, Benton, Mille Lacs and Kenabec; district 13, counties of Washington and Chisago; district 14, counties of Pine, Carlton, St. Louis, Lake and Cook; district 15, counties of Todd, Morrison, Wadena, Hubbard, Cass, Crow Wing, Aitkin and Itasca; district 16, counties of Big Stone, Traverse, Stevens, Pope, Douglas, Grant, Wilkin, Otter Tail, Clay and Becker; district 17, counties of Beltrami, Norman, Polk, Red Lake, Marshall, Roseau and Kittson.

WISCONSIN DIVISION

District 1, county of Milwaukee; district 2, counties of Racine, Kenosha, Walworth and Rock; district 3, counties of Waukesha and Jefferson; district 4, counties of Ozaukee, Washington and Sheboygan; district 5, counties of Dodge, Fond du Lac, Winnebago and Calumet; district 6, counties of Manitowoc, Kewaunee, Door and Brown; district 7, counties of Green Lake, Waushara, Marquette, Outagamie, Waupaca, Portage and Wood; district 8, counties of Adams, Juneau, Sauk, Vernon, Monroe and La Crosse; district 9, counties of Columbia, Dane and Green; district 10, counties of Iowa, Lafayette, Grant, Richland and Crawford; district 11, counties of Clark, Jackson, Trempealeau, Buffalo, Eau Claire, Pierce, Dunn and St. Croix; district 12, counties of Florence, Marinette, Oconto, Shawano, Anglade and Marathon; district 13, counties of Forest, Lincoln, Oneida, Vilas, Price, Iron and Ashland; district 14, counties of Taylor, Chippewa, Sawyer, Bayfield, Douglas, Washburn, Barron, Polk and Burnett.

IOWA DIVISION

District 1, counties of Allamakee, Clayton, Fayette and Winneshiek; district 2, counties of Dubuque, Jackson, Jones and Delaware; district 3, counties of Clinton, Scott, Muscatine and Cedar; district 4, counties of Louisa, Des Moines, Lee and Henry; district 5, counties of Jefferson, Van Buren, Davis, Wapello, Appanoose and Monroe; district 6, counties of Keokuk, Washington, Johnson, Iowa, Poweshiek, Tama, Benton and Linn; district 7, counties of Bremer, Blackhawk, Grundy, Butler, Franklin and Hardin; district 8, counties of Chickasaw, Howard, Mitchell, Floyd, Cerro Gordo and Worth; district 9, counties of Hancock, Winnebago, Kossuth, Emmet and Palo Alto; district 10, counties of Wright, Hamilton, Humboldt, Webster, Calhoun and Pocahontas; district 11, counties of Marshall, Jasper, Mahaska, Marion, Warren, Pork and Story; district 12, counties of Lucas, Wayne, Clarke, Decatur, Union and Ringgold; district 13, counties of Boone, Dallas, Madison, Adair, Guthrie, Audubon, Greene and Cairo; district 14, counties of Adams, Taylor, Page, Montgomery, Mill and Fremont.

HOW TO BECOME A MEMBER

The American Motor League invites to its ranks all motor car users of good moral character and all persons who favor the use and development of the automobile. The league does everything possible to put forward the safe and sane use of the motor car and aims to secure better roads, the publication of correct road maps, the erection of guide boards and danger signs and to perform other useful works in behalf of automobiling. The dues are nominal—$2 per year. There is no initiation fee. Full particulars will be sent on postal card request. Address F. A. Egan, secretary, New York city.

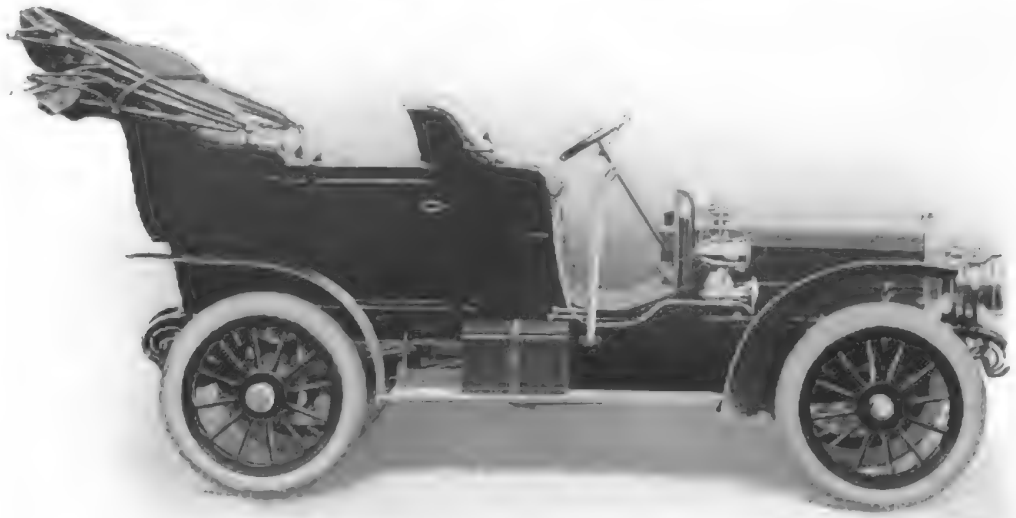
WINTON



Why Ground Parts Reduce Upkeep Expenses

Last week we emphasized the vital importance of GROUND Cylinders and Pistons.

But we can't stop there.

To reduce friction, wear, waste and Expense, **every working part** must be GROUND.

A Ground part has the smoothness of plate glass and is always Absolutely Round.

A part not ground has rough spots and streaks like common window glass and is never perfectly round.

Any bearing not Perfectly Round is a Bad bearing.

Move one unground part against another and the result is excessive friction and wear.

Unground parts in an automobile mean many Repairs, Replacements and Expense Bills. And the friction they create **cannot** be prevented by lubrication. You can flood such bearings with oil, but the Friction and Wear and Waste goes on just the same.

And that friction uses up part of the motor power which should be used in Driving the Car. That's Waste.

Consequently, it costs much more to run an automobile whose parts are not ground.

Also there are more repairs, and you get less mileage.

And when parts are not ground, they are likely to stick and bind, when least expected, and that may mean that you must leave your car out on the road until it can be towed home.

All motor car builders know this.

But those who use soft metal can't grind their parts. Because grains of emery would become imbedded in the metal and cut it (when the engine runs) worse than if not ground.

And cheap cars have no ground parts because grinding costs money and adds to manufacturing expense.

So, when you buy a car with ALL Working Parts GROUND, you are certain that the metal is hard and substantial and that the maker doesn't cheapen his car to save expense in manufacture.

In the new Winton MODEL K **Every** Working Part is GROUND.

Further still, all parts (where experience has shown it to be desirable) are both HARDENED and GROUND.

That means that in buying the Winton MODEL K, you buy greatest mileage, most serviceable machinery, a car whose power is **not wasted**, and one that can be run all the time at the **least possible** EXPENSE PER MILE.

WINTON MODEL K—Four cylinder, vertical, water-cooled; 4¾-in. bore; 5-in. stroke. Individual clutch transmission. Winton Air Governor. Winton Twin Springs. Lubrication, Ignition and Carburization simple and positive. $2500 f. o. b. Cleveland.

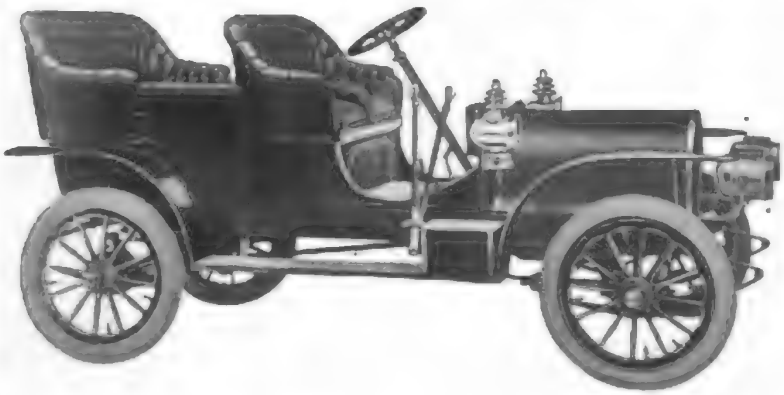
FRANKLIN



Type G

4-Cylinder Light Touring Car

Air-cooled. Shaft drive. Sliding gear transmission. Three speeds and reverse. New and perfect disc clutch. Force-feed oiler on the dash. Four or five passengers. Side doors. 88-inch wheel base. 12 "*Franklin horse-power.*" 1400 pounds. 35 miles per hour. Full head and tail-light equipment. $2800, F. O. B. factory.

"What Will It Do?" There's the Whole Question

This car carries its full load 30 to 35 miles an hour regularly on the road under actual conditions.

The intermediate gear is amply powerful for very bad hills.

The car is strong, roomy, comfortable — even luxurious, and extremely economical.

No other car will do so much work on so small an amount of gasoline and oil.

It is of the most perfect construction and made in every part of the highest-grade materials possible to put into a motor car, no matter what the size, rating or price.

It does all that any 20 horse-power car — except a Franklin — will do; and more than most 30 horse-power cars

"Why then, do we not rate it higher?"

Because it is 12 *"Franklin horse-power."* We must be honest with you."

But we must be honest to the car; and we will tell you that *"Franklin horse-power"* means more and does more — *far* more than anywhere near that rating in any other car.

If you forget this fact you are liable to cheat yourself.

Send for the book and you will understand it better. Ride in the car once and you will be certain of it.

"The Motor Car of the Future"

Digitized by Google

MITCHELL CARS FOR 1906

¶The average car that has an ***actual*** (not catalogue rating) twenty horsepower engine, will weigh about 2000 lbs., and most of them lose half of their 20 horsepower in friction before it reaches the rear wheels—this means a delivered to the rear wheels horsepower for every 200 pounds car weight.

¶In a high grade car, conscientiously put together, with bearings carefully fitted, this power loss can be reduced to about 25 per cent. This would now give a horsepower at the rear wheels for every 150 pounds weight.

¶By a new system of design the ***Stevens Duryea*** reduces this power loss to **10** per cent—and by this same system of design the weight is reduced to **1650** pounds. ***Result*** —a rear wheel's horsepower for every 92 pounds car weight.

¶In the first car each horsepower is saddled with a 200-pound burden; in the ***Stevens Duryea*** this burden is lightened to 92 pounds, and you can't find the like in any other car.

¶Now you know why we call the ***Stevens Duryea*** the ***Twentieth Century Hustler.***

ANNOUNCEMENT

The New Model 1906 Rainier

30-35 H. P.

has arrived. Note specifications below, then inspect it and try it. Experts who know Auto-cars from A to Z will be forced to admit that in beauty, workmanship, enduring strength and every other requisite of a perfect touring car, this magnificent new Rainier is THE American Automobile.

Engine—30-35 H.P., 4-cylinder, water-cooled.
Ignition—Sims-Bosch Magneto. Make and break spark.
Transmission—Sliding train, three speeds forward and one reverse.
Rear Axle—Bevel gear drive, clutch driven hub, ball bearings.
Front Axle—I beam section, ball bearings.
Frame—Cold rolled pressed steel, aluminum under-bonnet covering entire engine and transmission.
Wheel Base—104 inches.
Wheels—Imperial whalebone, grade A second growth hickory.
Tires—Continental, 34x4.
Valves—Mechanically operated, inlet and exhaust interchangeable.
Carbureter—Float feed, requiring no adjustment.
Brakes—Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
Body—Full aluminum, double side entrance.
Equipment—Two headlights, 2 side lights, 1 rear light, 1 horn.

Price, $4,000

The 22-28 h. p. will be continued as heretofore without any changes. 4-cylinder, 98-inch wheel base, La Coste coil, French battery, Continental tires, aluminum side door body.

Price, $3,500

Both models guaranteed free of repairs for one year. The world's broadest and most liberal automobile guarantee.

Landaulet bodies for immediate delivery. Limousines for October and November delivery.

REO 1906
Light Touring Car

16 h. p., 1600 pounds, 90-inch wheel base, 5 passengers, side-door detachable tonneau. Two speeds and reverse. Speed 35 miles per hour. $1250.

REO

This is the car that won three cups in one day in the great Paddock Hill climbing contest; beat its nearest competitor a minute to the mile in the international "Climb to the Clouds" up Mt. Washington; carried 4 people 1050 miles in the famous Glidden Tour at a total cost of $3.10 per passenger—without stoppage or repairs to the motor; and made a perfect score in the Los Angeles Dealers' Association run to Santa Barbara, winning its class and cup among 58 starters and 42 finishers, and tying for first place with a 24-horsepower car costing $2500.

This car has a more graceful body than last year. It is lower in the back, longer, wider and presents a more pleasing appearance.

Burns Gasoline. Not Money.

You want speed, power and style in a motor-car. You are willing to pay what is necessary to obtain them. But no man wants to pay two or three thousand dollars for qualities obtainable for half the money.

Don't Pay It. You Don't Have To.

REO cars have been winning cups all the past season; in speeding, hill-climbing, touring—and every other test of ability and service—from cars costing twice the money to buy; and twice as much to operate and maintain.

Send for the REO book which explains why

REO 1906 Runabout 8 h. p., 1000 pounds, 2 passengers, 26 miles per hour, **$650.**
Convertible into a 4-passenger car by means of a folding seat to carry two extra passengers facing forward. $675.

Has the same simple, compact, long-stroke engine as the Touring-car; the same style of radiator, carbureter, transmission, and high-grade construction and finish.

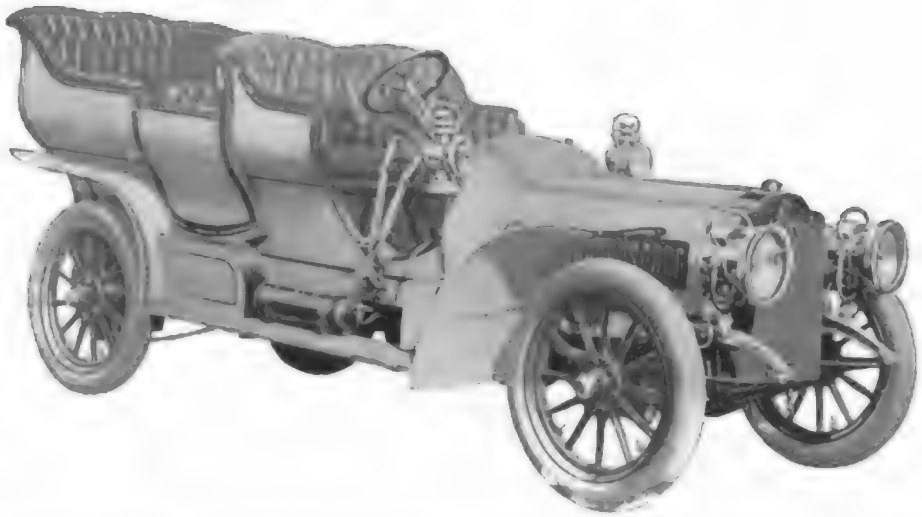
THOMAS

1906



In spite of the fact that we are completing the finest fire-proof factory in the world with a capacity of one thousand high powered automobiles per annum, it looks very much as though last year's scramble for Thomas Cars was going to be repeated.

Last year, premiums of all the way from $150 to $750 were refused for Thomas cars. We were likewise compelled to refuse orders for 50 per cent of our capacity.

The only sales we lost were those of a few unposted persons here and there, who couldn't see how so much value could be sold at so reasonable a price.

That idea was demolished last season and the fact that the 1906 Thomas is far costlier than the 1905 model without a change in price makes it unquestionably the greatest automobile value in the world today.

In brief what you have to consider is a car which demonstrated last year its superiority to cars costing from $1,500 to $4,000 more money.

A car with 50 H. P. (actual) which is quieter than it was last year; smoother than it was last year; has larger motors; is far more beautiful; far more comfortable, seating five or eight all fronting forward; with perfect clutch; perfect control; four-speed Hess-Bright Ball bearing transmission; four powerful brakes; forgings throughout; material guaranteed to be the costliest made; fifteen Hess Bright Bearings and one roller.

Analyzing this 1906 offering of power, beauty and the highest degree of construction, and bearing in mind what I have said to you about the probability of a greater demand than we can supply even with our increased capacity of 1,000 high powered automobiles per annum—do you not think it advisable for you to investigate the Thomas without delay by consulting our nearest representative?

E. R. THOMAS,

POPE AUTOMOBILES

MORE POWER, MORE SPEED, MORE ROOM, MORE STYLE, MORE STRENGTH, LESS WEIGHT

The double, outside chain drive makes the car run

As Light as a Feather

The Pope-Toledo, Type XII, 35-40 H. P., is the product of our many years of varied and valued experience in the construction of gasoline touring cars.

The Efficiency of the Motor is not secured by mere excess of bore and stroke in the cylinders, but the entire mechanical construction, including material and finish, has been so studied that we get one horsepower for every 10 8-10 lbs. of weight and this, too, without in any degree sacrificing strength, the margin of safety in all parts being as great as heretofore.

This is not the conclusion of a philosophical problem reasoned out by a keen, mental activity, but it is an actual result achieved by mechanical skill and proved under extraordinary tests over highways and country roads.

Send for a detailed description of this wonderful car and it will convince you of all we claim. Order now for early delivery.

Price $3,500

In the meantime, we have for **immediate delivery** our new Type X, 20 h. p., touring car fresh from the factory. A light, wieldy car, combining efficiency, comfort, style and durability.

Price $2,800

MOTOR CAR TIRES

The Most Serviceable Tires Made

No Internal Heating. The thread fabric construction makes the tire so pliable that it changes position in service with the least possible resistance, which means that the tires are very resilient, fast and free from internal heating.

No Pinched Tubes. The tire is fitted with a flap, which prevents the tube from coming in contact with the rim, or from getting under the edges of the case, preventing pinched tubes.

No Creeping. The flap forms a strong frictional contact with the edges of the clinches, holding the edges firmly to the rim for its entire circumference, so that it is impossible for the tire to creep.

G&J TIRE CO.

Boston Buffalo Cleveland Detroit INDIANAPOLIS Chicago Denver San Francisco

Just a Few Details

of our Models G and H which we could not mention in our announcement in Motor Age October 19 and 26: First a word about 2 cycle motors. In this construction all valves, cams, cam shafts and all gearings are entirely omitted as compared with 4 cycle motors. 75 per cent less working parts, 75 per cent **less** trouble. Our motor is as quiet as is possible to make a gasoline car. Both models, G and H, have 2 cycle, 2 cylinder vertical motors under hood in front. Beautiful body design, materials all of the very best, planetary transmission. **One lever controls all speeds and brake.** Model G lists at $650, Model H lists at $750.

CADILLAC CONFIDENCE

During October we have booked orders from dealers for just 1210 Cadillacs for 1906 delivery—Only a starter.

Every one of these dealers has ordered at least as many cars as he had in 1905, in some cases twice the quantity. But not one of them has even seen a sample of the cars he's bought.

Taking chances?

Not a bit. They know that Cadillacs have always been right and as the Cadillac Company has never led them astray, they have confidence that they will continue to be right. No freaks, no experiments to be tried on the public—just Cadillacs.

They know that Cadillacs are the kind that give satisfaction, the kind that sell and stay sold and don't worry them to death afterward. They know too, that most buyers know it and that the others are learning it fast.

We're taking 1906 business.

CADILLAC MOTOR CAR CO., *Member Association Licensed Automobile Manufacturers.* **DETROIT, MICH.**

The Automobile WASHSTAND-TURNTABLE

It greatly increases the capacity of a garage by saving the space otherwise required for maneuvering cars. It also permits a car to always face the door, thereby avoiding the inconvenience and danger of accident incident to backing it, when the approach is difficult.

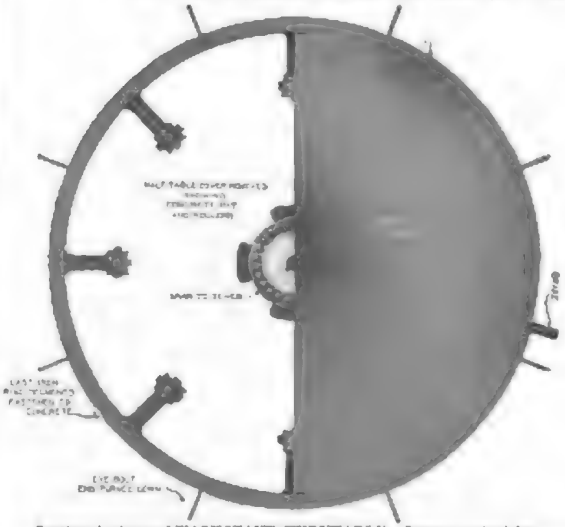
The table is of cast-iron supported by a ball-bearing pedestal in center and rollers near its outer edge. It rests in a concrete pit about 12 inches deep, the edges of which are protected by an iron ring or curb as shown.

It moves easily, is practically indestructible and is absolutely fire-proof.

It greatly facilitates the washing of cars, all water from surface of table and garage floor passing to sewer through a drain pipe in center of pit.

We make Washstand-Turntables and also plain turntables (without the washstand feature) for wheel bases up to 126 inches.

We will be pleased to send full descriptive matter and quote prices on request.



Sectional views of WASHSTAND-TURNTABLE. Patent applied for.

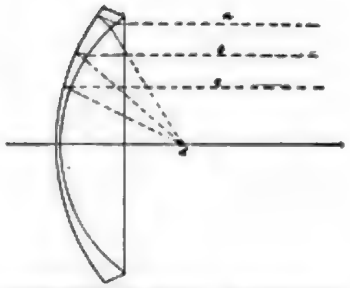
THE RELIC

A Re-Invented Relic

Theoretical Efficiency 80 per cent.	Theoretical Efficiency 50 per cent.
Actual Efficiency 10 per cent.	Actual Efficiency 40 per cent.



RUSHMORE NAVY STANDARD

NO The left hand view does not show the latest parabola-lens from Paris nor the latest American imitation of it, though it looks remarkably like them. : : : : : : : : : : :

It shows a searchlight patented eighteen years ago, made by us for many years and discarded ten years ago because of its ridiculously low efficiency compared with the Navy Standard Mangin Mirror, which was first perfected by us.

Theoretically, the "Relic" utilizes nearly every ray from the source of light. Practically, most of the rays are absorbed by the sheet copper, silver plated reflector and by the ridiculously heavy bull's-eye lens. The reflectors in the presence of burning acetylene cannot be kept bright, or even clean. Their efficiency, with the most careful hand burnishing, is never more than 50 per cent., and it drops in a few days to but 5 or 10 per cent.

We found by actual test that the carrying power of the Navy Standard Light with our short focus mirror, made only in our works, was ten times that of the "Relic," and we dropped the "Relic." That was ten years ago.

The Rushmore Mirror cannot tarnish. Its efficiency is the highest of any. When you compare "lamps" compare them as we did—in the dark—and see that the flames are the same size.

Hartford, Conn. Oct. 23, 1906.

The Hartford Rubber Works Company,

Hartford, Conn.

Gentlemen:-

You may be interested to learn that the Hartford Dunlop tires fitted to my two cylinder Knox which I have driven all season, have thus far covered a little over 3500 miles. I have had no trouble with the exception of four punctures. I am much pleased with the tires both as to their wearing qualities and the ease with which they can be removed and replaced.

I do not enjoy punctures but must admit that they are robbed of half their horror since using the Dunlop.

Very respectfully yours,

J. B. Boucher M.D.

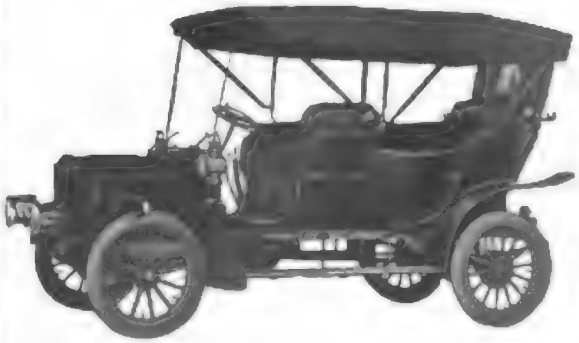
THE INCOMPARABLE

WHITE

THE CAR FOR SERVICE



MODEL "F" SIDE-ENTRANCE WHITE

This is the sixth model of the incomparable White steam car to be offered to the public. In our judgment, and in that of the many automobilists who have seen the car, the Model "F" leaves nothing to be desired.

There is something more than the luxurious appearance of the car, its speed and noiselessness of running, to influence your judgment in favor of our car. That "something more" is the uniform and unbroken success of White cars in all reliability and endurance contests, starting in 1901, and an unequaled record of accomplishments by a host of private owners.

Hill Precision Oilers

The first requisite in a mechanical oiler is ***efficiency.*** To be ***efficient,*** it must possess absolute reliability, and give perfect and unfailing service under all conditions.

The second requisite is ***economy.***

The Hill Precision Oiler combines both of these requisites—and the feature of economy is not confined merely to the saving in oil used, but in cutting out from the repair bill those items that always result from faulty lubrication. Read this:

THE OSCAR LEAR AUTOMOBILE CO.
Automobiles
Corner Fourth and Gay Streets

Columbus, Ohio, September 5, 1905.

The Steel Ball Co., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6-day endurance and economy run at Long Branch. In a run of 3,202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of all this we fully realize and its help in getting this record for our FRAYER-MILLER car. Yours truly,

THE OSCAR LEAR AUTOMOBILE CO.

THE STEEL BALL COMPANY
840 Austin Avenue

THE COIL THAT DOES THE TRICK

In the Climb to the Clouds

Chas. Soules, driving a Pope-Toledo fully equipped Touring Car, made the ascent in 20:37 2-5. This is considered a most wonderful performance. Besides

SPLITDORF COILS

were winners in nearly every event. Ask the Glidden Tourists how they like the Splitdorf Coil.

Seventy-five per cent of the cars on the tour were equipped with them.

HERE IS DR. PARKER'S LETTER:

Mr. C. F. Splitdorf. June 24th, 1905.

Dear Sir: I feel that in the recent 200 mile contest my success, in a large degree, was due to your coil. It seems to me that your latest is superior to anything in use to date. I tell my automobile friends to give me a SPLITDORF for reliability every time. Very truly, C. B. Parker.
167 Remsen St., Brooklyn, N. Y.

Winner of Recent Economy Test of Long Island Automobile Club

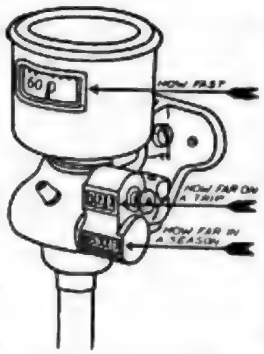
THE AUTO-METER "BUILT LIKE A CHRONOMETER"

TELLS THE SPEED OF TRAVEL TELLS THE DISTANCE TRAVELED

Tells both with absolute accuracy



The **Speed Dial**, six inches wide and easily read, records the speed of a car from a fraction of a mile to sixty miles an hour and does it unerringly.
The **Trip Dial** records the distance traveled on a trip or for a day.
The **Season Dial** records the total distance covered in a season.
There is satisfaction in knowing how fast your car is travelling, satisfaction in knowing how far it has traveled. You enjoy this double satisfaction with an Auto-Meter on your car. Some one of your friends surely has one. Ask him about it.

In the meanwhile let us send you a catalogue and interesting pamphlet, "Indisputable Evidence."

PREST-O-LITE GAS TANK

Supplies any number of lamps with a perfectly reliable run of pure, cool gas. Never leaks or gets out of order. No trouble, no time lost in waiting. No repairs necessary.

Chicago, Ill., July 27, 1905.

The Automobile Supply Co.,
Chicago, Ill.

Dear Sirs:
Replying to yours of the 24th, I am pleased to state that I have used the Prest-O-Lite gas tank since Jan. 1, 1905, with perfect satisfaction. I like the Prest-O-Lite for several reasons: It is clean; it is always ready; it is odorless; it gives a good steady light and is just as handy as the gas in your house. As to the expense as compared to the old carbide generator, will say that the tank is a little more expensive, but its advantages over the old carbide generator are so many that it more than makes up for the difference in expense.

Yours very truly, N. M. PERCY.

To be had of all dealers. Empty tank exchanged for full one by any dealer.

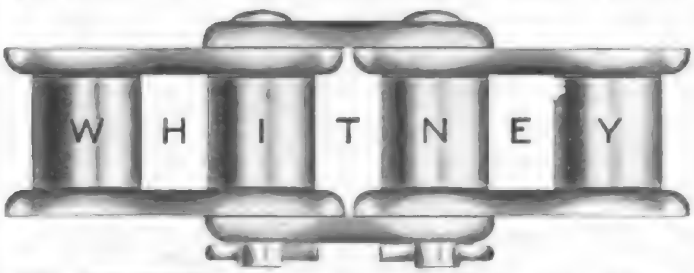
1906 Model "WHITNEY" Detachable Roller Chain—Patented



THE WHITNEY MFG. CO., Hartford, Conn.

Investigate "Whitney" Standards for dimensions of Roller Chains. They have been adopted by most of the leading American Automobile Manufacturers and have been recognized by other chain manufacturers at home and abroad. This matter of standards is certainly one of importance, and at some future date six sizes of chains for automobiles can perfectly take the place of over thirty sizes used in the past.

Our 1906 Models embody a number of improvements and they are breaking all previous records for quiet running and efficiency.

Digitized by Google

Front wheel and opposite rear wheel each raised over a foot.

Twist the car this way

When you inspect the car you think of buying, have the wheels raised in this same way. If the car doesn't meet the test as gracefully, without evidence of great strain, how much worse will it fare on rough roads with the speed up?

THE MARMON

"A Mechanical Masterpiece"

Is the **only** car that not only "goes everywhere," but goes there with such freedom from jar, jolt or vibration, that it possesses a very luxury of motion. It is the only car that can be run at good speed over rough roads without ruinous strain and undue friction on all parts.

Because it is the only car embodying the patented feature,

Double Three Point Suspension

Cast aluminum body on one frame, power plant on another frame, **each frame** suspended on three **pivotal** points. Eliminates the binding, twisting strains inevitable in the rigid suspension of all other cars. Perfect alignment and efficient power transmission under all conditions. Four cylinders; air-cooled.

To any one who is prepared to buy a car that is carefully constructed and really luxurious, the Marmon speaks for itself. *Write for Booklet No. 1.*

The Expected Revolution Has Come

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should not buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the two cycle two cylinder Elmore engine. Understand—the two cycle two cylinder Elmore engine produces two impulses every time the flywheel turns. As you know, the two cylinder four cycle furnishes only one impulse every fourth time the flywheel turns. In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

THE ELMORE MFG. CO., 804 Amanda Street CLYDE, OHIO

Moline for 1906

Why Premier Cars

Appeal to All Classes

To the Professional Man—because of its simplicity.

To the Business Man—because of its readiness to go at all times.

To the Repair Man—because of its perfect accessibility to working parts.

To All Men—because of its low cost of fuel and maintenance.

We have much data from drivers on this latter point; for instance, one writes us: "The total cost of my running this season—5,000 recorded miles—is only a trifle over one cent per mile for the car, or 1-5 to ¼ cents per mile per passenger; total for repairs, fuel, etc., excepting tires."

These are points to remember when purchasing a car.

The Air Cooled Season never ends.

Side Entrance $1,500. Runabout $1,250
Our new [1906] Doctor's Special $1,425
Light Truck $1,400

Talkin' of the Cost of Up-Keep

THE ROYAL Tourist Cars are run by their owners at less repair expense than any other motor cars built. You simply do not have repairs Ask an owner of a Royal how much it costs him to maintain it. Then compare his figures with any other car, big or little, touring or runabout. Royal owners everywhere. Ask one.

Why is this? Every part is put together with proper care. Money is freely spent for best materials. That's why.

That is also the reason why we were able to roll our cars over in the Vanderbilt Trials and finish among the first.

Swinehart Clincher Tire & Rubber Co.
AKRON, OHIO

New York City, 1773 Broadway Chicago, 1208 Michigan Boulevard

Why Goodyear Detachable Auto Tires Won't Rim Cut

WHEN an Auto Tire gets rim-cut, it's time to feel for your pocket-book and ask yourself, "What tire shall I get *next* time?"

For a rim-cut tire is pretty near its finish.

And the chances are ten to one that if you are forced to ride around the block on an ordinary tire with ordinary rims your tire will be rim-cut before you get there. Because ordinary rims are just like a dull jack-knife. Now if you wished to cut a strap with that dull knife, and the strap was held like Fig. 1 you couldn't do it, because your strength would not be great enough. But if you take the strap like Fig. 2, with a little sawing you can cut it.

Fig. 1

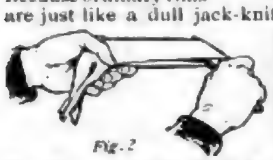

Fig. 2

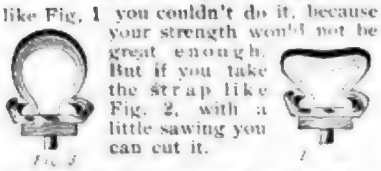

Fig. 3 Fig. 4

That's exactly the way the ordinary rim cuts the ordinary tire. When the tire is inflated, like Fig. 3, even the tremendous weight of the car is not sufficient to cause the rim to cut the tire.

Fig. 5

But just as soon as it gets flat, like Fig. 4, then the rim begins to cut it, just as the knife did the strap in Fig. 2.

Now look at the picture of the Goodyear Auto Tire on the Goodyear Universal Rim (Fig. 5.) The portion of the rim against which the tire rests forms the arc of a large circle. That rim can no more cut the tire than you could have cut the strap by using the handle of the knife instead of the blade.

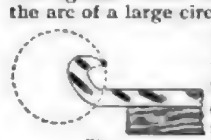

Fig. 6

Notice the edge of the ordinary rim used with ordinary tires (made into a circle), in Fig. 6, and compare with the Goodyear Universal Rim, used with Goodyear Auto Tires (Fig. 7.) Then you can see more clearly what we mean.

Fig. 7

We (and others) have ridden the Goodyear Auto Tire on Universal Rims *absolutely flat* for **25 miles** on rough roads without the least injury to the tire. We have the evidence if you would like to see it.

This is only one reason why wise riders are specifying Goodyear Auto Tires on Universal Rims for their new cars. Our "Good News Book" gives ALL the reasons. It is intensely interesting to Manufacturers, Dealers and Riders seeking relief from tire troubles.

SHEET METAL PARTS

For Automobiles

For obvious reasons we prefer not to insert in our advertising matter, at this end of the season, illustrations of our 1906 designs and construction details. Those who are in correspondence with us, however, know what is doing. Manufacturers who want inside information will receive prompt replies to their letters.

Our two large plants are ready to take care of our rapidly increasing business. We can not only promise but make deliveries.

During the past season we sold 12,945 radiators to 54 bona fide motor car manufacturers, among whom are nearly all of those who have produced high-grade and successful cars.

Over 30,000

BRISCOE RADIATORS

are now cooling automobile engines.

We make
Both Honeycomb and Tubular
Radiators
Iron and Aluminum
Hoods and Fenders
Sheet Metal
Dashes and Seats
Galvanized Iron and Copper
Gasoline and Water Tanks
Sheet Metal
Runabout Boxes

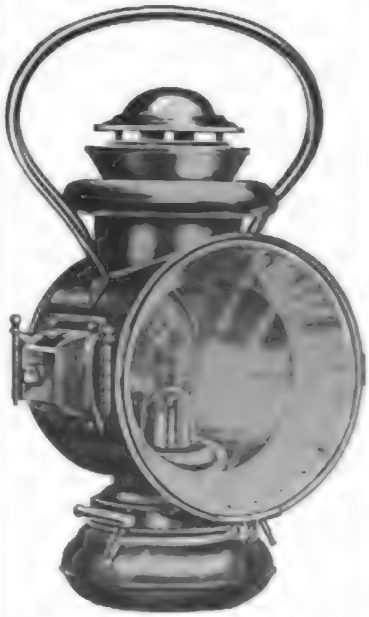
J. T. PEDERSEN, 642-644 First Ave., N. Y.



THE HAM GOLD BLAST AUTO LAMPS

"THE LAMPS THAT LIGHT THE ROAD"

MR. MANUFACTURER:

Don't close your lamp contract for 1906 until you look over our line. We have no competition in light giving and burning qualities, and our lamps will surely interest you.

MR. DEALER:

Isn't it worth something to sell your customers lamps that will not only satisfy them, but will bring them back to tell you what a fine light they give, how steadily they burn in the strongest winds and over the roughest roads, and what a good fellow you are for selling them good lamps. They'll tell their friends about it, too.

MR. AUTOMOBILIST:

Are you discouraged with the oil lamp proposition? If you are, we know you haven't tried the

HAM COLD BLAST AUTO LAMPS

because they are a delight to the most critical. They are strongly built, handsome in appearance, give a powerful light, and are always reliable, as they are wind proof and will not jar out. Never smoke, consequently the interior is always bright and clear, and there is no odor.

Bausch & Lomb MANGIN Search Light Mirror Lenses

Afford the only means of utilizing ALL of the light produced by the burner of an automobile headlight. You never can have too much light if you want to ride safely at night. Be sure your lamp has a B. & L. Mangin Mirror.

¶ These mirrors are of optical glass as accurately ground and polished as the search-light mirrors used on battleships, silvered by our own process, which assures the utmost brilliancy and permanence and tempered to withstand heat and vibration.

¶ See that your lamps have these mirrors. They are used by all the best lamp makers.

¶ When used on launches and motor boats of all kinds you are insured against accidents.

The "Breech-Block" Plug

The Plug With a Handle

To take out your watch or open a *Breech-Block* requires just the *same time, same tools, same effort*, and *any twist* cleans the entire porcelain to the whiteness of snow.

To remove the porcelain only, loosen the clamping nut and it *drops* out of its holder, and the gaskets of copper drop with it. No digging!

It is *nickeled* inside and out. *Highly polished* and *rust-proof*. Sparks between *two adjustable* points and not between *one* point and the *shell*. Its points are *protected*.

Porcelains are *hand turned* and so perfectly glazed that soot cannot *stick* to them. Their threads are cut to perfection, and *every* particle of the idea of ringaroses is left out of them. Can you think of a way to improve them regardless of cost?

Postpaid, Anywhere, $2. Booklet Free. Made by

We Want Agents
for the
OLIVER
Typewriter
—the standard visible writer—

in cities and towns where we are not at present represented. An agency for this progressive and up-to-date typewriter carries with it a dignified and profitable position for high class men. We aid our agents to achieve success and extend their field as their development warrants. We seek to make it worth while for good men to remain with us permanently. Previous experience neither essential nor objectionable. The Oliver agency can be carried on in connection with other business in some localities. If you are the kind of man we are seeking, we will enter into details by correspondence on receipt of your inquiry.

Colorado
At Her Best

In late summer Colorado is at her best. The green of the verdure on mountain and meadow is slowly turning to crimson and gold. Afar looms a peak whose snow-capped summit is enshrouded in autumnal haze. The air is laden with the spice of mountain pines and fir trees.

Colorado is surely the best place to go for the autumn vacation.

Very low rates via the Rock Island—Standard and Tourist sleepers and electric-lighted chair cars.

Go via Chicago, return via St. Louis if you like.

Use this coupon to learn all about it.

If You Are a Judge of Good Plugs

so much the better, but if you are not, it really does not matter, for you've only to try a "Never-Miss" to realize that

NEVER-MISS

Spark Plugs

are the perfection of ignition. Mica (Plugs) Porcelain. They are the one plug that satisfies. They take and bring you back. The 1906 Never-Miss (patent applied for) is the best. Any size, any car, any where, $1.50 and worth it. Coils, Battery Connections and Chain Tools. Just get acquainted with Never-Miss. The acquaintance will be lasting, our word for it. 1 Doz. Battery Connections free with 2 Plugs. Fully guaranteed. Write today. The longer you wait the more good spark plug enjoyment do you "Miss." See the point?

Never-Miss Spark Plug Co., Lansing, Michigan

There was a time when a regular and reliable ignition was a problem. This problem is solved today by the **HERZ TIMER**. We have made and sold over 70,000 of these instruments last year, to the most prominent manufacturers in this country, as well as in Europe, and are making now four distinctly new models for four of the leading manufacturers in America. The reason for this success: It's Tool Steel vs. Tool Steel, best Sheffield grade obtainable; **Sticking Vibrator** absolutely impossible; running packed with grease; built like a watch, fool proof's work throughout. We make 18 models and fit **any** make of motor. State make of your motor when ordering.

VOL. VIII NO. 19 CHICAGO, NOVEMBER 9, 1905 $2.00 Per Year

MOTOR SCENES IN NEW ENGLAND

NEW ENGLAND is rich in tradition and attractive to automobile tourists. Radiating from all cities there are drives, making a network over which scores of cars continually pass. Connecticut, one of the smallest of the states, is conducting a great good roads campaign; is probably building a larger percentage of mileage than any other commonwealth, and takes a certain pride in the fact that it is building its roads better and cheaper than any other state in the union. But there are districts where the good roads movement has not yet reached and where the highways continue to be the same old red gravel upon which the less prosperous husbandmen work out their annual taxes, or, at least, a part of them. For cars not of the asphalt parade class one of the most delightful short runs in central Connecticut is from Hartford to Tariffville and Granby. Tariffville is but the tail of the dog town of Simsbury, but is growing so fast as to wag the dog, while Granby is the scene of more romance than could be logically crowded into the average historical novel by even a Churchill.

Tariffville possesses all the features of an attractive automobile Mecca; there is an old hotel, modernized with new paint only, and the latest books on tours show

MODERN BRIDGES HAVE REPLACED THE OLD COVERED AFFAIRS ALL THROUGH THE NEW ENGLAND STATES

Digitized by Google

On Most of the New England Highways the Trolley Antedates the More Modern Means of Transportation, the Motor Car

that the proprietor is possessed of an excise license. It is but 12 miles from Hartford and to get to it the motorist goes through an endurance run and a hill-climbing contest that makes Eagle Rock and Pecousic hills look like tesselated flooring. It would only be necessary to brush a bug from one's collar to send a car and its occupants to kingdom come. It is the kind of road that breeds a certain respect for the sure-footed mule. Across the plains the scenery is interesting, for great white tents, 9 feet tall, cover 1,500 and 2,000 acres each. Under these tents tobacco grows. The natives know good Havana tobacco when they see it, for most of them raise it. It costs 12 to 20 cents a pound to grow it and brings 40, so the prosperity of the farmers is great. They are not so much opposed to automobiles, for most of them buy every novelty that comes out, from a new patent churn to a self-playing piano. They all have money to spend. The village barber has scores of visitors, who see him three times each week, which is uncommon in high grass country.

There are stretches of improved macadam and telford roadway, passing through some of the towns, but most of the way would afford the best known cure for a torpid liver. The heavy rains pour down the mountain sides and furrow deep holes, while the hand of man has raised water bars and thankyermams which cause the front end of a long wheel base car to oscillate with the rear seat passengers. There isn't a water bar that doesn't boast of the number of springs it has caused to break, and for a mile and a quarter there is a stretch of sandy loam where tobacco grows finely, which holds the heat uncommon well, and which has been the scene of many tires going wrong. Still, there isn't a feature about the trip which the motorist wouldn't suffer willingly to get there.

Tariffville isn't so much of a town, in a way. There is the Farmington river rolling by, which water power has been used by a lace mill and an electric light generating plant. Advantage was taken of one architect's handiwork and the natives have to count four from one end and five from the other to pick their own domicile out. Nobody could get jealous of their fortunate neighbors where all houses are alike and the skyline would be pretty monotonous to look at from the hills above if it wasn't for the regularity being occasionally pierced by a school house or church or the town hall.

The Tunxis band of Indians resided about Tariffville and everything in town is Tunxis. There is the Tunxis river, Tunxis hotel, Tunxis laundry, ad lib. Tradition tells of the residence of Lord Griffin early in the English occupation. Lord Griffin didn't anticipate the coming of automobiles, but he well knew the power of gasoline. The Indians troubled him greatly. They stole his sheep and hens. So, in a little cove where the water is still and the current nil, Lord Griffin stealthily applied some oil. Then he sought to make peace with the Indian chiefs. He would burn up the river and all the fish if the Indians didn't keep their side of a line he established. His proposition was laughed at, so the torch was applied. Sure enough, the waters blazed. Before the oil had burned off a truce had been declared. Tariffville land records continually blossom forth reference to his lordship's line as boundaries of farms.

All the land around Tariffville is owned now, or once was, by a Mitchelson. Two brothers, Ariel and Joseph C., remain to boast of their proud heritage. Ariel is located at Tariffville and drives about in a big Winton car. J. C. and his family manage to get back summers, but their address other times may be Kobe, Japan, or Sydney, Australia. Although it is a bad country for electrics, with hills eating up 130 amperes of current, J. C. does his motoring in a Columbia victoria. While Joe Mitchelson was in some lonesome and faraway location of the footstool increasing his coin, or book collections, some enterprising capitalists threw a dam across the Farmington river and flooded some

The Tariffville Dam—Most New England Streams Are Now Harnessed

Digitized by Google

A Splendid Stretch of Exceedingly Smooth Road, Guarded by Tall Shade Trees, Winds Its Way Through Old Windsor

meadow land of his. So the Mitchelsons have all the electric current they can use.

The Tunxis house has always been famous as a place to trade horses. A whole regiment of David Harums make periodical trips to Canada and come back with "forty head," no more, no less. They rather resent the automobile, but the proprietor is glad to note a pleasant day, especially Sundays, when a row of them line up at the hitching shed. The Tunxis house dinners are famous, and have been, down the ages.

From Tariffville to Granby is a short ride. Some tortuous hills have to be negotiated, and the road is good. Part of the way the road runs through an old canal bed, the Northampton canal. When the first march of manufacture began in New England and transportation became a problem, $4,000,000 was raised to build a canal, with an outlet at New Haven. With the advent of the railroad the canal went out of business and the Northampton branch, or canal road, as it was called before it came to the consolidated system, runs on the towpath, while the highway runs in the canal bed itself. The scenery is particularly charming from Tariffville to Granby, since it is left wild and is, for the most part, unspoiled by cultivation. Granby raises important crops—33 degree politicians and jurors.

The chief feature of interest in Granby town is Old Newgate. Remaining intact is Old Newgate prison, where British prisoners of war and tories were confined in the revolution, and there is hardly a motorist in Connecticut who has not made a run to Granby to view the shops, and to make the descent down the deep shaft by a rickety ladder route to the copper mine, hundreds of feet under ground, and tunneling under a mountain side where runs an icy cold stream and where, in rough-hewn undreground barracks, the most obstreperous convicts were confined.

In the town of Granby proper there is one house in which Washington and Lafayette are not charged with spending a night. There are so many homes in Connecticut about which legend has these distinguished personages as proud guests, that the impression goes out that the first president and French court dandy sampled each habitation in rotation. Any fast car will quickly take a party from Granby to Oil City.

Windsor is famous as the home of Oliver Ellsworth, who was an early chief justice, and whose old home, typically colonial, is now owned by a chapter of the Daughters of the Revolution, and Colonel E. N. Phelps, who still lives. The motorist who runs down Colonel Phelps, who can tell you how many times removed he is from Cotton Mather, would think that Uncle Sam had stepped out of a double-page funny paper supplement. He's tall and lank and close shaven, except for a little whisker of gosh-ding-its, from out of which the honk honk of a motor horn might scare up a couple of meadow larks or a field mouse or two. Windsor, too, claims Fitch, the inventor of the steamboat, and Captain Christopher M. Spencer, inventor, who, when a boy, rode around the country described above in a steam automobile of his own making and informed the natives of Lee's surrender and the close of the war.

Windsor is on the main line of travel from New York to Boston and a stream of automobiles ebbs and flows through the town. There is a bad turn under the railroad, where a grade crossing was eliminated, where only one vehicle can pass at a time, and as escapes from serious accident have been numerous, it is known as Colonel Phelps' deathtrap, since the colonel designed it. Windsor grows tobacco and as land is worth more for crops than for building lots, its building progress is slow, despite the fact that it is one of the most beautiful of the Hartford suburbs. The run from Windsor to Hartford is over a fine macadam highway, with only one hill, Stoney hill. The run to Springfield is longer and takes cars over a fine highway through Windsor Locks, Warehouse Point, Enfield street, and Longmeadow, and by way of Pecousic hill, into Forest park and Springfield.

The Famous Old Farmington River, Which Tasted Oil Many Years Ago

O. K. ON MILITARY CAR

Germany Conducts Tests and Decides Automobile Rivals Railway Train in Speed

Berlin, Oct. 28—That automobiles will soon be used in warfare is the opinion of many motor enthusiasts in Germany, which has devoted much money to the encouragement of research for rendering the government one of the foremost in military affairs. At the instigation of the military authorities a test has been given to try the efficiency of automobiles in transporting guns and troops and the results, although experimental in a large part, serve to show, the Germans assert, that motor wagons for the transportation of troops, guns, ammunition, soldiers and even heavy pieces of ordnance will be an assured success before many years.

The test, which was principally given to try the efficiency of two-seated motor wagon as transporters of troops, was held on the country roads near Wien and manoeuvers were gone through by the troops similar to those which might be used in opposing or retreating from an enemy.

With Wein as a center, forces were distributed, lines of men thrown out and ammunition distributed. Bridges and hills were seized as vantage points and men were retired after the most approved military tactics.

As is usual with careful Germans, accurate officials took account of time and gasoline used, and of weights and measurements, and the results show that the automobile is a fair competitor with the railway is transporting troops and is far superior to the footwork of the infantry.

The first experiment consisted of a dash from Purkersdorf to Tulln between two forces, one mounted on automobiles with guns and ammunition in automobile wagons, and the other a regularly equipped force of German cavalry and infantry—two companies. Needless to say, the automobiles arrived at Tulln and took possession of all the vantage points far in advance of the enemy. Arms and ammunition were distributed and the men stationed with all the regularity of war. The distance between the two points was covered in good time in spite of the road being a little slippery from recent rains. Darracq machines were used by the troops.

The second experiment was between two companies of men provided with motor cycles, two-seated vehicles transporting wagons for ammunitions and arms and officers in automobiles. The run was between Traiskirchen and Tulln by two different routes, the one 55 kilometers and the other 30 kilometers long.

The best time made by any one of the 50-kilometer route men was 2 hours, a Bayard-Clement machine-gun automobile reaching Tulln in that time, making a little over 30 miles an hour.

The party going over the 55-kilometer route appeared in Tulln in 3 hours and 7 minutes, the 60-horsepower Mercedes machine-gun automobile leading the half-dozen scout two-seated vehicles. In the meantime the infantry was hiking along as best it could, but despite the fact it hay-footed, straw-footed to the best of its ability, it was distinctly outclassed by the speedy automobiles, which dashed over the country roads with an aggravating ease. So successful were these tests that the German officers who have advocated military motoring feel they have scored a big point over the old fogeys who can see no good in anything modern. It is believed that the trials won motoring many friends in the army.

ROYAL IN A. L. A. M.

New York, Nov. 4—The most important action taken at the annual meeting of the Association of Licensed Automobile Makers on Wednesday, news of which was not given out until after the executive committee meeting the following day, was the admission to membership of the Royal Motor Car Co., of Cleveland, O. It is officially announced that the new licensee agreed to pay back royalties on all cars manufactured since January 1, 1903.

Another change in membership was the purchase by the association of the license for manufacturing and importing held by the Worthington Automobile Co., of New York, which now ceases to be a member. The company is now interesting itself in the manufacture of steam vehicles.

The annual election resulted in the full list of incumbent officers and the executive committee being chosen for another year. These officials are: President, Charles Clifton, of the George N. Pierce Co., Buffalo, N. Y.; vice-president, William E. Metzger, Cadillac Automobile Co., Detroit, Mich.; secretary, L. H. Kittredge, Peerless Motor Car Co., Cleveland, O.; treasurer, H. H. Franklin, H. H. Franklin Mfg. Co., Syracuse, N. Y.; executive committee, Charles Clifton, George N. Pierce Co.; F. L. Smith, Olds Motor Works; E. H. Cutler, Knox Automobile Co.; S. T. Davis, Jr., Locomobile Co. of America, and M. J. Budlong, Electric Vehicle Co.

A report was received from the newly incorporated Association Patents Co. to the effect that it was now practically at work with the patents interests of the members of the association. A report from the show committee was received stating that all of the space for the show in Madison Square garden has been allotted and that artistically the show will surpass not only everything ever held in this country, but also the big spectacular exhibition of Paris.

FRANCE HEDGING

Paris, Nov. 4—Special cablegram—It is believed by those on the inside that the French authorities are somewhat shaky on the stand they have taken against racing and that there is a move on foot to hedge a bit. This belief is borne out by a story which appeared in the Figaro yesterday, which stated that it is probable that a speed race will be run over the Auvergne course next year by the Automobile Club of France. This is expected to lead into developments which may result in France not only defending the Bennett trophy, but the Vanderbilt as well, despite its announcement that it washed its hands of the racing game.

TOUGH TRIP TO COAST

Chaydeane's Motor Cycle Ride Across Continent Marked by Rough Going and Tumbles

Buffalo, N. Y., Nov. 8—Members of the Buffalo Motor Cycle Club are rejoicing over the feat of their captain, William C. Chaydeane, who has succeeded in smashing the transcontinental record for motor cycles, having crossed from New York to San Francisco in 47 days 23 hours 50 minutes, beating the old record of 51 days. Chaydeane reached his destination October 31, after a strenuous trip, on a 1906 model 44 Thomas Auto-Bi, covering over 4,000 miles of mud, dust, prairie, sage brush and snow. He met with accident after accident, escaping death many times by a narrow margin. He plugged along, day after day, with insufficient sleep, very frequently going 2 or 3 days without a square meal. He left New York city September 30. He was up against it from the start, expecting to leave New York on a Monday, but was delayed by the express company until Wednesday. As he stood before the rooms of the New York Motor Cycle Club, the rain was pouring down in torrents. The grasp of a hand from some of the members who were present, a goodbye and good luck from R. G. Betts, president of the F. A. M., who pinned the emblem of the federation on his flannel shirt, and he was off. From New York to Albany he found fairly good going. Apart from a few punctures he had no particular difficulty, except during the second day, when the rains had made the roads extremely treacherous, and in one slippery place he pitched into a ditch and suffered his first bad spill. From Albany to Buffalo he found nothing but mud and rain. He reached Buffalo about 1 a. m., having encountered a seething torrent of rain just outside of Rochester. From Buffalo to Erie he found good roads and he thought that at last his luck had turned, but by the time he had reached Cleveland, outraged nature had begun to take a hand in the game, and he was compelled to go to the hospital, owing to a severe indisposition, brought on by exposure and irregular meals. The doctors told him that a rest was imperative, but he left the hospital, tightened up a couple of loose nuts on his wheel and started west.

Chaydeane eventually reached Chicago, but here he met a friend who compelled him by sheer force to lay off for 24 hours and go to bed. This rest, together with some attention to his trouble, put him in better shape, and from Chicago westward he was feeling much better. He was averaging nearly 100 miles a day, but owing to occasional mistakes as to the right road his mileage was necessarily much greater than if made by rail. He finally reached the vast prairies of the western country, and from Omaha on his trip was marked almost daily by incidents of the most varied nature, sometimes humorous and sometimes almost serious. The conditions of the roads, in many cases covered with sand and mud, the steep grades, and the almost daily spills served to delay his

Digitized by Google

journey. For 3 days he remained at Ogden, tied up by a snow fall which made the roads simply impassable for a two-wheeled machine. Spills were so ordinary that when at one place he ran foul of a snow bank at the foot of a hill and pitched over a 30-foot embankment, his first question to the cowboys who picked him up, after being unconscious over an hour, was as to the condition of his machine. After a little vigorous treatment with a crowbar and a couple of wrenches, which he took from a nearby threshing machine, he managed to bend it back into shape, so that the wheels would turn. Mounting again, he bumped over the rocky road to Ocho, and finally reached Ogden, after riding nearly all night.

PORTLAND AFTER GOOD ROADS

Portland, Ore., Nov. 6—The Portland Automobile Club has begun a good roads campaign that is to be carried on strenuously during the year 1906. There will be no lack of money to push it. At a meeting of the club at Claremont tavern it was decided to apply to the Multnomah county commissioners for improvement by the county of 10 miles of the Linnton road, extending from Portland to Claremont, the club entering into a contract with the county to keep the road oiled and repaired at the expense of the automobilists. A continuous effort is to be made by the club to stir up interest in automobiling, improve the beautiful roads about Portland, and add to the number of high grade cars in commission here. All the automobiles in this city have been bought within the last 2 years, but only a few are of the powerful four-cylinder type. There are now 200 machines, and more than 125 of them have been bought this season. The Lewis and Clark exposition did not do much for encouragement of automobiling. No automobiles, bicycles or horses were allowed in the grounds. Only one local dealer made an exhibit at the exposition. The activity in the automobile business in Portland this year is due to the hustle and pluck of the dealers.

HINTS OF FRENCH DEALS

London, Oct. 28—It is said that preparations are in progress here and in France for the flotation of the Panhard & Levassor and Darracq companies, but nobody has been able to break through the official reserve so far as to get either confirmation or denial. One would not be surprised to hear that Darracqs had decided to get the public's support, for the firm has found its way into the hands of capitalists who must have acquired it with that eventuality in view; but that Panhard & Levassor should be designing such a move is an eloquent indication of the opinion of its owners. People don't sell such businesses until they think that high-water mark has been touched. Panhards will be over-subscribed. That is certain, but all the same we may take it for granted that those who are now running it think that the French motor-car industry has very nearly reached its zenith. Panhards would float easily at $5,000,000, but in all probability the conversion will not be a simple one of transferring to the public entire proprietorship.

IS HUB DEEP IN DUST

Megargel Finds Oregon Roads Must be Navigated Carefully on Transcontinental Tour

Drewsey, Ore., Oct. 30—Four hundred miles more and Portland! This to an eastern reader, surrounded by good or fair roads, sounds easy, but as I sit here and gaze at the mountains that surround Drewsey, mountains that require, in many instances, 10 and 12 hours to drag up wagons of supplies, I know that it is rather more than 2 day's run to the Keats' garage in Portland, and think that the Reo Mountaineer will be making good if it negotiates the distance in a week. It takes a freighter 11 days to make the run from Ontario to Burns, 150 miles. This will give an idea of how hard a pull it is through the Blue mountains of Eastern Oregon.

Rain visits Oregon—that is to say, the eastern section of the state—at rare intervals. In the western section it is all rain, or, at least, so much so that the people residing in Portland are said to have web-feet. Just at present there are about 10 inches of fine alkali dust on road and trail. In some places, where there are the remains of mud holes, the dust is 14 to 20 inches deep and so fine that an automobile tire sinks the entire distance, until it rests on the solid ground. The greatest care has to be exercised in driving over this road, as to sink into one of the dust holes means the stranding of the car and sometimes an hour's work with jack and spade to get it out.

The weather is all that an automobilist could ask for—cold in the mornings, but warm and comfortable driving after 11 o'clock, when we usually strip off sweaters and outer jacket. The roads are well laid out and the majority of creeks are bridged. The grades are evenly divided all the way to the top of the mountains, and then we coast until brake bands are burning.

At Boise City, Idaho, just prior to our starting off, we ran into L. L. Whitman, the record-holder. Whitman and I have been reading each other's doings for the past 3 years and it is needless to say that we had a good half hour together, comparing notes. Whitman has made the trip from the Pacific to the Atlantic twice. This will complete the second trip I have made from the Atlantic to the Pacific, so we found much to talk about, as our routes for the greater part of the distance, lay over the same course. Accompanying Jim Taylor, in the latter's Franklin, Whitman ran out 15 miles toward Ontario with the Reo Mountaineer and then wished us good luck.

Anyone traveling over this section in an automobile cannot help but be struck with the excellent opportunity for some automobile enthusiast to bid in the stage line running from Ontario to Burns. The United States offers this mail route to the lowest bidder, with certain stipulations, every 4 years. It will be awarded again this fall. Every 15 or 16 miles along the route are stage stations, where the horses are changed and the mail is carried through from Burns every 24 hours. Burns is situated 150 miles from Ontario, the nearest railroad point. Enough money can be secured for carrying the mail to pay expenses of running the automobile stage line, and carying passengers would all be velvet to the promoters.

Gasoline can be had from every little store along the route, as I found out from my last trip, although to take no chances I started out from Ontario with 25 gallons. At Vale, Westfall and Drewsey, gasoline can be secured, although the further west we travel the more gasoline costs, as the freighters charge in the neighborhood of 2 cents a pound for everything brought into Burns.

Owing to the fact that we are obliged to use our low speed so much in the mountain climbing, we have been running nights, or until 2 o'clock, ever since entering Oregon. Our Dietz searchlight enables us to follow the dangerous mountain trail with perfect safety, lighting up the narrow pathway, until rocks and alkali pits are as plainly shown as by sunlight.

Our Mobiloil, shipped to different points along the route by the Standard Oil Co., has never failed us, nor have we experienced the slightest trouble from our engine or transmission, both of which we keep well flooded at all times.—PERCY F. MEGARGEL.

FIRE IN APPERSON PLANT

Kokomo, Ind., Nov. 7—Special Telegram—Apperson Brothers' automobile plant was attacked by fire during last night and the old original frame building, the first floor of which was recently vacated as a machine shop and turned into a junk room, and the offices located on the second floor suffered practically total destruction. The flames, however, were confined to this building, which was only two stories in height, and to the one-story brick building just back of it, which was formerly used as stock room, and to the blacksmith shop, where the damage was only slight. Mr. Apperson states that the loss is covered by insurance and that the delay, so far as getting out the company's product is concerned, will be very slight, inasmuch as practically everything of value had been moved out of the departments which were destroyed, to the new building upon its completion a short time ago.

TALKS CRANKSHAFTS

New York, Nov. 6—Crankshafts and their bearings were the subject of discussion at the November meeting of the mechanical branch of the Association of Licensed Automobile Manufacturers, held last Wednesday. Various members of the organization, superintendents from the factories of representative manufacturers, exhibited drawings of their crankshaft construction and after giving all the dimensions, telling the pressure on the bearings, the material used, methods of construction, of lubricating, etc., answered such questions as the others chose to put. The subject for the December meeting will be the best method of inspecting and testing cars, so as to be certain that they are all right before shipping them from the factory to the branches and agencies.

AUTOMOBILES AND FREIGHT RATES

WHILE President Roosevelt is endeavoring to bring the railroads to time over the question of freight rates, the automobile is going ahead, regardless of red tape, showing the world how easily and how cheaply it can haul passengers—and if passengers, then freight—at a rate per mile far below what a railroad asks and receives. By the time congress and the president and the railroads have come to any sort of an understanding—mutually or forcibly—the motor car will have made such strides before the commercial world as to force the railroads to do what all other means have failed to do in the history of the country.

Just what railroads can afford to do in the matter of cutting rates for hauling passengers or freight and just what they will do are two matters that differ considerably just now, but a few short years hence what they can do and what they will do will be nearer the same thing, if the automobile keeps on making the record it has been making during the past few years.

The recently finished economy test has opened the eyes of the commercial and traveling public and if railroad officials have studied the matter they must have received a jolt of no small proportions. Outwardly these officials will never admit this; inwardly they will set about to head off the avalanche that will soon engulf any movement that may be the means of taking away any portion of their business.

One motor car carried a load of passengers at a cost of 4 mills per mile per passenger; it could have carried 150 pounds of freight at the same rate; in fact, it could have carried more than this amount of freight.

There is no immediate danger that the motor car will interfere with the railroads in the matter of passenger or freight business as far as long hauls are concerned, but in matters of short hauls the day of the steam locomotive on steel rails is doomed, and the trolley, too, will have a competitor up to which it must look.

The motor car will not be a factor in long hauls, or even in middle distance hauls, until some improvement has been made in highways, but that will come as fast as the motor car goes on showing such remarkable work, and as fast as the highways receive improvement, then just so fast will motor cars become thorns in the sides of the railroads.

In earlier days canals were established as a means of holding the railroads down to legitimate and reasonable freight and passenger rates, but the canal boat succumbed to the progressive locomotive, whose one weapon was speed, notwithstanding increased carrying charges. The motor car has already proved the locomotive's foe in the matter of speed, so that in this respect it is not handicapped, as was the canal boat. Now it is gradually creeping up on the locomotive in all ways and has already passed it in point of economy.

Although speed is a large factor, dollars and cents count for everything in the commercial world. The motor car, with its already marvelous speed and its economy of operation, must, then, become the locomotive's rival in the world of commerce.

The motor car has its drawbacks—it is not a perfect piece of mechanism—but it is young and is making headway. It is not blessed with a smooth track upon which to travel, but it is not handicapped by extensive costs for rights of way, track and roadbeds. It must, it is true, depend upon the public highway for its track, and the highways must be far better than they are now if the motor car is to perform its function of regulating railroad freight and passenger rates.

Like all new things, there will be some opposition to such a use of the public highways, but it must be remembered that it is as reasonable for the motor car to transport freight and passengers over the highways as it is to haul corn and wood and other necessities over them in horse-drawn vehicles, and that it can be done cheaper and quicker than by horses and as quick and cheaper than by the locomotive. It must also be remembered that the citizen is receiving the benefits and not the Wall street system, and when this is recalled the public will too willingly give its consent to the use of highways by motor cars.

The system will be busy for a few years to come with its own affairs and may not give heed to the advance of the motor car until its influence shall have begun to show on the earnings of the railroads. Then the system will sit up and wonder. It will be futile to try to head off the motor car—it is now too well established and too much of a necessity to be driven out of the commercial field—and the system, being made up of wise minds, will probably climb into the band wagon. As the great American people stamp approval of the motor car, that much faster will good roads come.

The economy test of the New York Motor Club was little thought of a few weeks ago; a short time hence it will be a topic that will cause more thought on the part of the commercial world than any act congress could perform in the matter of passing freight-regulating bills. It will have set the entire world to thinking—railroad owners and officials, the merchant and citizen, the motor car manufacturer. The latter will for a time devote himself to study in order that the defects found to exist in motor car construction—and it must not be supposed that none was found through this test—may be remedied and that another test may prove more satisfactory than this one.

There will be an effort on his part toward making the motor car what it must eventually be—the balance wheel of the railroad, if it does not go further and surpass the latter as to trade places with it entirely. It will bear watching, this little giant of the road, not by the constable and the dinky little municipal official, but by the selling public and by the buying public.

EARLY SAMPLES AND THEIR EFFECTS

BY THE time the automobile shows have come and gone the manufacturers of automobiles who have waited until the last moment to produce their new models will have learned the wisdom in the story of the early bird and the worm. Those makers who already are out with their samples will have practically sold their outputs ere the shows take place. Some of the agents who would have attended the shows will remain at home, for, having selected their lines and placed their orders, they will secure better results by staying home and selling what they have contracted for rather than waste time and money going to shows. As it is, the late makers will take what is left in the matter of agents and it is by no means certain that what is left after the plate of apples has been picked over is worth taking.

The modern manufacturer has no fears of a rival stealing his ideas. He knows he is original and that originality will be appreciated; that as long as he builds good cars, marked with improvement from season to season, he need not suffer in the matter of sales. The late maker will have learned before another season passes that he must have his models out as early as his neighbor, and the result will be that all will be on the market long before the previous year's models have ceased to run under sunny skies. With all producing cars at such an early date, it means that earlier shows will be forced upon the maker and the public, and that the selling season, instead of beginning in the spring, will open at the dawn of winter and will not be hindered by cold and snow.

From all evidence that is at hand it would appear that the early show is soon to come, that the late maker will be unknown, and that the man who wants a next season's car can have it long before the season arrives.

JUMP SPARKS

Now let the railroads hold an economy test if they expect to meet the automobile on common ground.

* *

The czar of Russia seems to be having about as tough a time with his subjects as is the mayor of Chicago with the windy city motorists.

* *

After all, France has changed its mind and will hold a big road race, which suggests that some one did remark that there was a little bluff left in the land.

* *

It is at least a little satisfactory to automobilists to know that the scarehead of the daily press has been forced to the ball instead of automobiling, even if it will be for only a month or two.

* *

It isn't true that Senator Depew is to run an automobile express line next year on the Hudson river this winter. The senator is absorbed in the ocean beaches, and, besides, he has one or two to discover before he finds anything else.

* *

Mayor Dunne of Chicago had a little taste of what motorists receive too frequently, when, in starting on a speech-making trip in his automobile, the axle of the machine struck a sewer cap and was temporarily wrecked. This ought to suggest things to Chicago's chief executive.

* *

The best evidence of the popularity and utility of the automobile is its growing use on the part of the chiefs of police and other municipal department heads all over the country. The only trouble is the automobiling policeman now has a distinct advantage over all other scorchers, which is somewhat unfair.

* *

With all the election returns are in the automobile will come in for its share of glory as a campaign adjunct.

* *

This is the sort of weather that causes one to forget he has a water-cooled motor until after the bill for new cylinders has been received.

* *

By the time the foreign makers have studied the result of the recent economy test here, they will have received another jolt to their think tanks.

* *

There's a good deal of doubt as to what will happen to that New Jersey automobile license law after the lawyers and the courts get through with it. It ought to be pretty well picked to pieces.

* *

Judging by the quantity and quality of motorophobia that has existed the season through, one may well fear the assembling of the various legislatures the coming winter. The anti-motorists will be there with a good many feet.

* *

In forty-five counties in Illinois, Iowa, Michigan, Indiana and Wisconsin, where county fairs and street carnivals were held, seventy people were injured, some of them being performers and others occupants of horse-drawn vehicles. For once the automobile was not to blame.

* *

Whatever mean things may be said about automobiles and automobiling, automobiles tend to teach patience, self-restraint and forebearance. Ask the man who has wrestled with a balky motor, repaired punctured tires or has run up with [illegible] automobile regulations *per se* [illegible] automobile officials all over the country.

THE WEEK IN BRIEF

William C. Chaycraft's feat of covering 1,000 miles on motor cycle in 47 days 7 hours 47 minutes arouses admiration of Buffalo cyclists over feat of their fellow townsman.

So many applications received for space at Chicago show that Manager Miles is forced to delay announcement of allotment for another week.

Germany tests military cars and outlines automobile for military use, declaring it to rival railway in point of speed and usefulness.

Jap Clemens, in a National, smashes 100-mile truck record at Indianapolis, doing the distance in 1 hour 53 minutes 21 4-5 seconds.

Percy Megargel fights dust in Oregon but says that last 400 miles into Portland is going to be far more strenuous than it seems.

Belief in Paris that Automobile Club of France will promote race over Ardennes circuit next year.

Red omnibus wins economy test of New York Motor Club, with Reo runabout second.

REO BUS WINS ECONOMY TEST

ALONG THE HUDSON EN ROUTE TO ALBANY

NEW YORK, Nov. 6—All of the original entrants in the New York Motor Club's 6-day economy test took part in the final stage of the journey from this city to Southampton, L. I., and back. Compound No. 5 had been the victim of a series of mishaps. It had stripped a gear on the way to Philadelphia the first day, secured a new transmission from the factory and started again, only to plunge into a ditch in the darkness and break an axle sleeve. It was on hand, though, for the run to Albany, but at Cold Spring it went into a fence, through its brake giving away on a down grade. The decision of the judges gave the honors to the Reo bus, with the Reo runabout second. The bus averaged 4 mills per mile per passenger, carrying ten.

Just out of town on the run to Albany the gear of the Frayer-Miller went to the bad, necessitating a return to the city. A new transmission was wired for and shipped, but it failed to arrive in time to cover the Albany stage by night running, as was contemplated.

The run to Albany and back included a somewhat strenuous struggle, with bad hills, strange roads and darkness, on the outward bound trip, yet the 150 miles were covered in time around 10 hours. The voyagers profited by experience on the run home, made a start nearer to 7 o'clock and beat the outward bound time by at least a good full hour.

The run to Southampton and back, over good roads and level all the way, barring the short stretch through the Shinnecock hills, was a cinch. On the homeward trip most of the cars reached the final garage somewhat before 5 o'clock in the afternoon.

RESULT OF THE ECONOMY

No.	Car	H. P.	Passengers	Gasoline
3	Reo bus	16	10	$16.00
4	Reo runabout	8	4	7.99½
6	Compound	15	5	10.87½
9	Wayne	20	5	12.40½
8	Olds	8	4	10.35½
7	Compound	15	4	10.34½
2	Marmon	20	5	14.82½

The total journey aggregated 682 miles, made up of round trips of 202, 300 and 180 miles, to Philadelphia, Albany and Southampton, respectively. The aggregate of $14.53 car fare per passenger was, of course, badly beaten by the automobiles, whose average cost per passenger ran from $2.93

EASTERN MILLIONAIRES ARE SPEED MAD

New York, Nov. 6—Senator Morgan's 2-miles-a-minute race at the Florida meet has set the racing world aflame. The talk of the trade identified with the racing game is now all of great speed creations to be built to capture the star event of the annual tournament. Millionaire racing enthusiasts are already looking about for cars with high speed records. As was to be expected, there was a jump for the 110-horsepower Fiat, which Lancia drove in the Vanderbilt race at an average rate of over 70 miles an hour for over 200 miles of the running. George W. Young, a broker, new to the racing game, has secured it. He has already engaged Harry W. Fletcher, who won the Vanderbilt 100-mile contest on the beach last year and also scored world's road records in Cuba, to drive it in the Ormond-Daytona, the Palm Beach-Miami and the Cuban races.

ON THE NEW YORK ECONOMY TEST RUN—ALONG THE HUDSON AT DUSK

Senator Morgan makes light of a cable from Havana printed in the Herald to-day, which hints at the possibility of the abandonment of the Cuban carnival unless a subscription of $14,000 to defray expenses be forthcoming. As is well known, last year's race entailed a heavy loss, which was met personally by Senor Conill, president of the association, whose car won the Havana cup. The senator had a conference with Senor Conill on Saturday, at which the Cuban sportsman promised a personal subscription of $2,000. Next year's race will be 200 miles, four times over the 50-mile stretch between Arroyo-Annas and San Christobal. The road will be oiled to a width of 15 feet. The grand stand is to be erected by outside speculators and will be commodious.

Senator Morgan had a conference with his advisers today, at which the programme for the Ormond-Daytona meet was finally determined. No change in the events already announced was made, but to the card were added two events open to amateurs under the A. A. A. definition—a 10-mile Corinthian championship and a 10-mile amateur handicap. The entry blanks will be issued early next week. The card, as finally made up, will consist of nineteen competitive events and time trials at a mile and a kilometer. The 2-mile-a-minute race, however, will also be run in the form of flying start time trials and will be starred as the feature event.

Economy Test Car on Southampton Road

to $4.58 for the three different types of cars.

The results of the test are set forth in the annexed table. Though the committee proposes to do a lot more figuring and possibly some correcting, the figures given are substantially correct. In the table the difference between the total cost and the total fuel charges will represent ferry charges for a total of six crossings added to the charges for mechanical adjustments and replacements and tire repairs.

TEST TOLD IN FIGURES

Average	Oil	Total	Av. per Pas.	Av. Per Pas. per Mile
$1.60	$3.38¾	$29.30	$2.93	$0.0042
1.99¾	.25½	13.54	3.38½	.0049
2.17½	2.12	18.62⁷/₁₀	3.72½	.0054
2.48	2.10	19.81½	3.96⁷/₁₀	.0058
2.59	.42	15.86	3.96½	.0058
2.83½	2.13	17.18½	4.29⁵/₈	.0062
2.96½	1.40	22.91½	4.58⁵/₁₀	.0067

Though the results are based only on the performances of seven cars, these cars represented three classes of vehicles—the passenger bus, the runabout and the touring car. The test was well conceived and well carried out and will well serve as a basis for similar and more generally representative economy trials in the future.

The actual cost of fuel for the three different styles of vehicles competing—bus, runabout and touring car—shows that the average per mile, per passenger, for the first class was slightly less than 3-10 cent per mile, for the second exactly 3-10 cent and for the third 4-10 cent per mile. When it comes to a ten-passenger bus, traveling at slightly less than 3 cents per mile for gasoline and oil, and maintaining this average for 682 miles over various country and city roads, the anti-motorists had better get their pencils and paper out and see where they get off with their single or double horse outfits.

The prospective buyer of a runabout machines can find solace in such figures as $8.25 for fuel and oil for carrying four passengers 682 miles. When dissected, these figures place the fuel cost per mile for the four passengers at 1⅛ cents, from which it can be deduced that the ordinary citizen in a large metropolis, who has to go 8 miles each morning to his business office and home as many at night, can do this at a daily outlay of 19 cents, having the privilege of carrying three of his friends with him for the same expense.

PLAN TO EXTEND CHICAGO'S BOULEVARDS

Chicago, Nov. 7—The windy city is already noted for its magnificent park system, but if the additional improvements now talked of are put on it will improve this system of boulevards until it will be without a peer. For some time a movement has been on foot to link the pleasure highways of the three divisions, but it was not until last week that an official estimate was received. A commission of experts, consisting of J. W. Cremin, F. D. P. Snelling, W. E. Casselman, Albert Schoenbeck and Robert H. Bulkley, reported to the board of local improvements that in its opinion it will cost $8,000,000 to link the boulevards. It is figured that the damage to property and condemnation proceedings will amount to $4,392,001, that a new bridge across the river at Rush street will cost $1,500,000, while an equal sum will be required to cover the purchase of leaseholds, construction of a retaining wall along Central avenue, reconstruction of pavements, sewers, basins, lighting systems, etc.

The board will hold a public hearing early in December on the proposed condemnation, at which the whole subject of the boulevard link will be debated. The question of undertaking the improvement then will be taken under advisement by the commissioners.

The district to be assessed for the expense of the improvement is fixed by the experts as the territory extending from North avenue to Thirty-third street along the drive and in its immediate vicinity. The boundary on the south, the Thirty-third street boulevard, furnishes an outlet for the entire south park system through Grand, Oakwood and Drexel boulevards, and for this reason the experts fixed this limit. The value of the land to be condemned between the river and Ohio street is placed at $311,454, while that between the river and Randolph street is valued at $2,242,116. The assessment for this on the north side will be spread upon all lots and blocks lying between North avenue and the river, both sides of State street, and on Lake Michigan and will be 37½ per cent, or $957,590, for the land alone. It will be borne by the property owners of this district. On the south side the assessment for the land value will be 62½ per cent, or $1,593,980.

The Reo Bus, Winner of the New York Motor Club's Economy Test

CLEMENS DOES REMARKABLE CENTURY

THE TWO NATIONAL CARS, WITH CLEMENS AND MERZ UP, ON THEIR NECK-AND-NECK STRUGGLE AT THE SIXTY-SECOND MILE

INDIANAPOLIS, IND., Nov. 5—To the National car, driven by Jap Clemens, belongs the honor of smashing to flinders the best authenticated record for 100 miles. It was no racing machine that performed this stunt—just a stock car stripped of some of the surplus weight, which made the century in 1 hour 53 minutes 21⅘ seconds, as against the mark of 1 hour 56 minutes 39 seconds credited to Guy Vaughn in his 1,000-mile drive on the Empire City track last June. This performance was made yesterday at the Fair Grounds in a competitive drive designed to put up a mark which would demonstrate thoroughly the capabilities of the automobile at going such a distance at top speed.

Those who saw the performance marveled at the regularity with which Clemens reeled off the miles. Beautifully handled by the veteran, the National ripped off mile after mile like a chronometer, never varying, with one or two exceptions, more than a minute at any stage after the first mile, the average for the century being 52.9 miles an hour. Naturally the first mile was the slowest, Clemens taking 1 minute 19⅘ seconds to make the oval. Then he settled down to work and the time sheets show him as having run with great regularity the rest of the distance. His slowest mile after the first was the eighty-fourth, which was done in 1 minute 14⅗ seconds, while the fastest was the ninety-eighth, which was done in 1 minute 5⅕ seconds.

Five cars started in the test—two Nationals, a Premier, a Marion and a Maxwell. Charles Merz, in the other National, took the lead at the start and cut out a merry clip. Clemens kept his eye on the lad and stayed within striking distance. Merz showed great skill and remained in front until the eighty-third mile, when the officials called him off to put on a new tire. This cost him 5 miles, but he gamely started again, but he had hardly gotten under way before the new tire slipped from the wheel and car and driver crashed into the fence. He was going 53 miles an hour at the time, but he luckily escaped injury. Two of the others were distanced much earlier than this, Fred Tone, in a Marion, quitting at 13 miles; Frank Moore, in a Maxwell, lasted a little longer.

This left only Clemens and Ray McNamara, in a Premier, but the National man was never in danger. He was miles in front and coached by those who were pulling for him to do something in the record line, he carefully rated his car along with the sole object of putting up a century mark that would take a lot of beating. His engine was going along without a skip and there was every indication that he would be successful. Starting in on his last 5 miles, he did the ninety-sixth in 1 minute 6⅘ seconds. The next round he slipped back a bit and the watches showed 1 minute 8 seconds. Then he whooped 'er up and the result was the fastest round of the entire performance, the mile being done in 1 minute 5⅕ seconds. The ninety-ninth was in 1 minute 7⅕ seconds and the 100th in 1 minute 7⅘ seconds, Clemens coming in on the bit, as the horsemen present expressed it.

Struggling far in the rear was McNamara, so far behind that it reminded a yachtsman in the stand of the first race sailed for the America's cup, when an English lord reported to the queen that the Yankee boat had won. "Who was second?" asked Victoria. "There is no second, your majesty," reported the courier. McNamara, though, did well and would have been in the limelight had it not been for Clemens' record feat. He did his century journey in 2 hours 15 minutes 31⅘ seconds.

"That certainly was one of the smoothest performances I ever witnessed in the motor line," said a tradesman who was present at the trial. "There those two Nationals went along mile after mile, Merz leading by not more than 30 feet at any stage and often the two were running tire and tire. It was decidedly unfortunate that the tire incident occurred, otherwise one or the other would undoubtedly have clipped off several more minutes. With Merz put hors du combat in the eighty-third mile, Clemens was without a pacemaker just at a time when he needed it most. Whether or not Jap would have won is doubtful, for the youngster certainly showed great skill in handling his National. On the other hand, Clemens displayed discretion in the handling of his car, and I never saw such excellent judgment of speed shown when in an affair of this kind.

"The performance of the Premier car in the 100-mile contest was especially praiseworthy, despite the fact that it finished second to the National. The Premier in this event is only a runabout—a 16-horsepower car that ran with remarkable regularity. So far as can be ascertained the engine went the full century without a skip or a break of any sort. While the 40-horsepower National gathered in a world's record for 100 miles, the Premier people file a claim for a record themselves, asserting that 2 hours 15 minutes 31⅘ seconds, the time made by their runabout, is a mark never before reached by a car under 20 horsepower.

"The average speed of Clemens' National was 1 minute 8⅕ seconds per mile and you will notice, by looking at the sheet, that two of the miles were much slower—one nearly 1 minute 20 seconds and the other just inside 1 minute 15 seconds, so you see he had to make up quite a bit of lost ground to get the average he did.

"The National that did the trick was a 40-horsepower machine and the track an ordinary oval used for horse racing. Going nearly a mile a minute, you can appreciate how well the car ran when you consider the turns which

JAP CLEMENS IN THE NATIONAL JUST AFTER THE FINISH

Digitized by Google

bobbed up just about the time Clemens would get to going in the straight. I consider his performance one of the best in the record-breaking line we have had this year. Clemens is comparatively unknown as a driver. He was once prominent in the cycle trade and has always been an athlete, being especially expert as a football and polo player. Merz is only 19 years of age."

SANCTIONS TO BE SCARCE

New York, Nov. 6—At a meeting of the executive committee of the National Association of Automobile Manufacturers, last Thursday, it was decided to limit the sanctions for local shows to those cities in which shows were held last year, and to make it only on the condition that the proceeds of such shows must go to organizations of local dealers. Such local organizations must admit all reputable dealers who have been such for at least 1 year upon the same basis as all other members, and the dealers must not call upon the manufacturers they represent for financial assistance in the conduct of their exhibits.

C. G. DINSMORE DEAD

New York, Nov. 8—Special telegram—Clarence Gray Dinsmore, third vice-president of the Automobile Club of America, died today of pneumonia after a brief illness. Mr. Dinsmore was also foreign representative of the A. C. A. and an enthusiastic follower of international road racing, Jenatzy driving his Mercedes in the Bennett race in Ireland.

MORGAN GOES SOUTH

New York, Nov. 8—Special telegram—W. J. Morgan will leave New York tonight for Florida to arrange for the automobile exhibit at the Jacksonville pure food and industrial exposition, January 4 to 18, and will also go to Daytona for the purpose of putting up of new timing wires on the Ormond-Daytona beach.

SHOW IN FATHERLAND

One Hundred and Fifty-Four Firms Occupy Spaces in Frankfort Motor Car Exhibition

Berlin, Oct. 26—The Frankfort motor show is now on, 154 firms occupying spaces. Among the most prominent is the Daimler company, with machines ranging from racing cars to vans, including an omnibus carrying thirty-two persons and 1 and 2-ton delivery vans. The Neue Automobile-Gesselschaft, familiarly known as the N. A. G., and a sister company to the British General Electric Co., shows, in addition to 10 and 20-horsepower cars, a couple of heavy vehicles and an army tractor with trailer. The features of the N. A. G. line are the round form of radiator and few hand and foot levers. The Durkoop company has everything from a small, light car to a giant van. The Gernsbach omnibus, which starred in the recent van and omnibus trials of the Automobile Club of Germany, is shown by the Suddeutsche Automobil-fabrik, of Gaggenau. This concern is using a lighter superstructure and the 16-horsepower phaeton has a detachable roof, which may be replaced with a summer one. It also has a light model using friction-drive. The Schiebler people of Aix-la-Chappelle, have a motor omnibus.

Exhibitors from outside Germany include the German De Dion-Bouton Co., the Turin Itala Co., the Societe Anonyme des Ateliers Germains-Monceaux sur Sambre, and the Puegeot concern.

Tires are well represented, the Simplex especially being in the limelight with the tire that can be mounted instantaneously on a patent double felloe. The Continental people are in line as usual, as are the German Rubber Tire Industry, Louis Peters, Albert Calmon & Co. and Dunlop Tire Co., who all have magnificent displays.

The Argus Motor Co., of Berlin, displays a chassis with chrome-nickel steel axles and the 1906 models show a new spring suspension, the upper back springs consisting of laterally-curved half-springs set in the frame ends.

COLUMBIA CHANGES

Hartford, Conn., Nov. 6—Many radical changes will be found on the four-cylinder 1906 Columbia. The ignition is make-and-break with magneto current. The cylinders are cast in pairs, but appear to be individual, the middle section being of aluminum. Lubrication of the crankshaft bearings is by means of a rotary gear pump, the oil falling to a reservoir below the crankcase. The supply is sufficient for 400 miles of travel. The drive is by a telescoped shaft. The forward axle is I-beam construction and the rear axle set consists of a fixed tube containing the live axle, the weight of the car being borne by the axle housing. While a car of medium power was designed and while the rating is said to be placed at 24 horsepower, tests have put the power higher.

OLDSMOBILE REUNION

New York, Nov. 8—Special telegram—The reunion of Oldsmobilists in celebration of the fifth anniversary of the introduction of the little curved front runabouts in this city was the election day event in motordom. The idea, which was the conception of Roy D. Chapin, of the Olds Motor Works, and General Cutting, the company's local representative, made a big hit and will probably be a forerunner of similar reunions of drivers of Oldsmobiles and perhaps other makes in this city and throughout the country. Around noon time the avenues and streets in the neighborhood in upper Broadway swarmed with curved front runabouts and other cars of the genus Olds. When they were all drawn up in a double line on Fifty-first street they reached from Broadway to Eighth avenue.

NEW 100-MILE FIGURES MADE BY CLEMENS IN A NATIONAL

THE NEW THOMAS CAR

THE Thomas Flyer for next year is a 50-horsepower machine which shows many radical changes over the present Thomas car. The E. R. Thomas Motor Co. has spared nothing in making the construction of the present car high grade. By way of changes it can be noted that the atmospheric inlet valves have been replaced by mechanically operated valves, and that the inlets and exhausts are placed on opposite sides of the cylinders. Instead of the cone clutch there is one of the disk type, four forward speeds are used in the gear case, the wheel base has been increased, from 104 and 110 inches as used at present, to 118 inches, very long springs have been added and four brakes fitted. The unique style of Thomas bodies is retained, but the top of the back seat is lower, eliminating the heavy appearance associated with the very high back. The square corner effect is replaced by easy corner curves. Chain drive, hollow metal dash, ample carrying compartments, and most of the other features are retained.

The sub frame, so common on this year's machines, has been dropped, the motor now being carried direct on the main frame side pieces, which are offset in front for this purpose as well as to increase the turning angle. These side pieces are of deep section and taper considerably toward the rear, but not so much to the front. In cross bracing channel sections are used, each being riveted and supported by large gusset plates, also riveted in place. Where the side pieces are offset they are reinforced by heavy channel pieces.

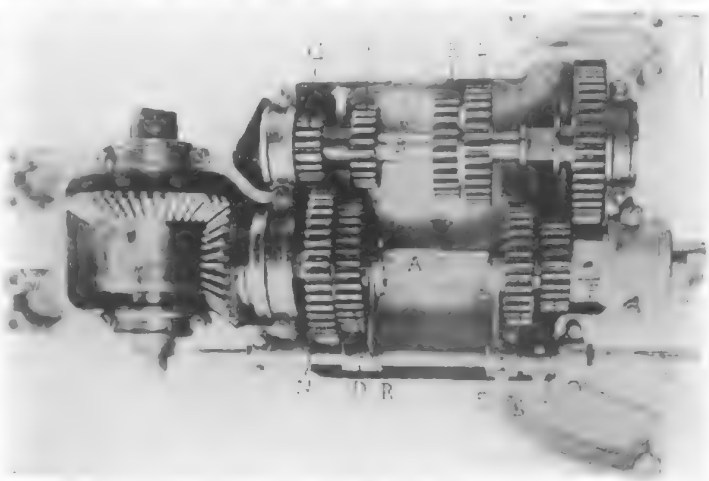
Instead of using tubular axles, the drop forge I-beam type are now employed. These are made of steel and have been treated for this purpose in order to stand shocks, stresses and strains. The rear axle is one piece, including the spring seats, in this way eliminating the use of brazed spring seats. The knuckle forgings are machine tapered, with large fillets, and are attached to the I-beam yokes by a hardened and ground pin. All wearing parts are fitted with hardened steel bushings. The road wheels are made to take 34 by 4½-inch tires and each revolves on two races of Hess-Bright ball bearings. The weight of the car is approximately 3,000 pounds.

In the construction of the motor, each cylinder is made in a separate casting, with such parts as the inlet and exhaust valve ports, cylinder heads, and water jackets forming an integral casting. All valves are made interchangeable and are placed in the bottom of their respective ports, the method of removal being through openings in the valve port heads. The inspection caps over these ports are ground to fit and are secured by a cross yoke, held in place by a setscrew, the loosening of the screw and giving the yoke a half turn being sufficient to lift the cover plate out. Both camshafts are encased within the crank chamber and are driven by external gears of the combination type, having very wide faces and protected by an aluminum shield. The crankshaft is a drop forging, ground to a finish all over and runs in long plain bearings fitted with chain oilers. Each oil pit beneath the crankshaft bearings carries a supply sufficient for 750 miles. The cylinders have a bore and stroke of 5½ inches, giving the rated power at 1,000 revolutions. Each piston is ground and the five piston rings are ground to 1-10,000 inch. The wrist pin is hardened steel and ground. On the pistons are oil grooves filled by the oil admitted through the cylinder walls, one oil duct from the mechanical oiler to each piston. Forged steel connecting rods are supplied.

The cooling facilities have been increased by adding practically a third to the radiating surface and increasing the service of the water pump threefold. Little change has been made in the ignition system. It is practically the same as that used for the last 2 years, with the single unit coil and jump spark system and with either dry cells or storage batteries. Provision has been made, however, for attaching any of the recognized magnetos, which can be directly attached to the motor and gear driven. The commutator has been improved, but, as was the case this year, will be located on the dash and is gear driven. Hitherto the wires have been gathered about the commutator, but now they are removed from sight.

The carbureter is of the automatic type and is manipulated from the top of the steering gear, as is also the lever for advancing and retarding the spark. It is directly connected to the clutch pedal with the independent throttle, which acts as a governor when either the foot or emergency brake is used. It is provided with means for taking either hot or cold air.

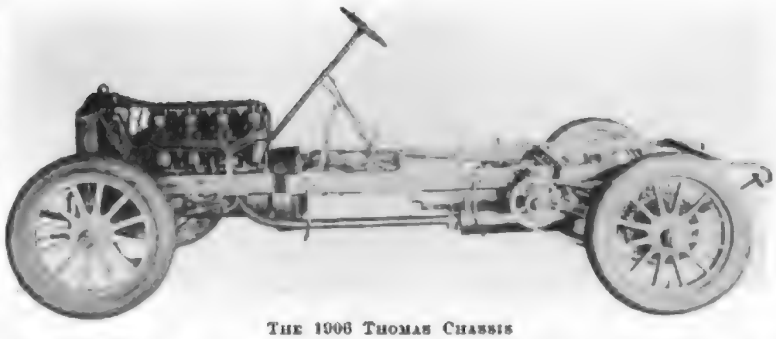
A mechanically operated oiler is located in the dash. The tank is of liberal size and has six sight feeds, four of them leading directly to the cylinders and two to the crankcase. The oil is delivered through the medim of individual pumps. In addition to supplying oil to the crankcase by the pump system an in-



FOUR-SPEED GEAR SET OF THE 1906 THOMAS

Digitized by Google

dividual oil cup is also supplied, insuring a quantity of oil in the case. The lubrication there is by the customary splash system. In charging the case with oil two pet cocks are located in the bottom of the crank case to indicate the proper level of oil when the case is filled.



THE 1906 THOMAS CHASSIS

For the Thomas car next year the disc clutch has been adopted. It is a metal to metal, three-plate device. The center plate is of manganese bronze and the outer plates are of gray iron. The manganese plate, being a transmitting member, is provided with a series of holes filled with cork cushions. The push pedal, with an easy pressure, releases the clutch. The clutch is provided with ball thrust bearings and adjusting screws for taking up wear. The prevent the transmission shaft from running when the clutch is disengaged a special thrust is provided, causing the shaft to come to a standstill, enabling the operator to shift the gears easily.

In having four forward speeds in the sliding gear case, a feature common in most of the high class European machines is added. The case is carried on two of the frame cross pieces, two short curved arms on the front of the bottom part of the case supporting the front part and a pair of arms close together carrying the rear end. Enclosing of the differential gears in the rear end of the case gives that part a narrow formation, necessitating the arms being close together. The use of Hess-Bright bearings throughout the gearcase and jackshaft, with the exception of the main bearing marked F, is a leading feature. Changes in speed are gained on the selective principle, two shifting units moved respectively through the shifting arms D and E, eliminating the necessity of passing through intermediate gears when changing from a low to high speed or vice versa. One lever at the right, working in a double-slotted quadrant, is used in making speed changes. On the direct drive the shaft C from the clutch is connected with the squared main shaft A by moving forward the gear, S, as shown in the illustration, so that dental face teeth on its forward side interlock with others on the rear side of gear T. The gear M on the counter shaft being moved forward at the same time is taken out of mesh with T and the countershaft is left stationary on direct drive. For second speed ahead gear S is moved back, meshing with L, and at the same time M moves into place, meshing with T. For third and fourth forward speeds the unit comprising gears N and R is moved so that R meshes with K for the third speed and N with H for the fourth. In reversing gears N and G are connected by an idler. The shifting arm D is mounted on the shaft X, which is connected with the gear shifting lever, and E is on a sleeve on the shaft and is similarly connected with the shifting lever. All gears are interlocked with the clutch, the clutch being thrown out before a speed can be changed. In this year's cars all gears have a ⅞-inch width, but in the 1906 model this has been increased to 1¼ inches. They are all drop forged and of large diameter. All of them are made detachable, so should a break ensue or any change be necessary replacement may be made speedily. Rapid inspection of the gears is made possible by the use of a large inspection cap in the top part of the case. Final drive is through double side chains, Whitney roller chains being used. The sprockets are made with the hub part and the ring piece carrying the teeth separate, being fastened together by bolts, the object of the construction being to facilitate the changing of speed ratios without interfering with the adjustments of the jackshaft bearings.

As the differential is in conjunction with the transmission case, this also has been improved by the addition of another set of pinions, increasing the strength. The brakes are four in number, two of large dimensions on each rear wheel. Two of the brakes are of the internal expanding type and are operated by pedal and the other two are external, operated by the emergency lever, but both brakes are connected in such a manner that with one movement of the emergency lever all brakes are applied, the clutch is disengaged and the motor throttled, but the foot brake is of such proportions and strength that by its use alone the car may be held on heavy grades.

The hill-climbing safety device is retained and the strength of its construction increased. This device consists of ratchets on the outside of the rear axles, into which a dog slips by the working of a small lever at the right side of the operator. It can be engaged or disengaged while the car is traveling at any speed.

In body design the dash, made of aluminum, is shaped to conform with the hood and lockers are situated on each side for carrying small tools. Natural wood is used in the interior finish. The present side tonneau lines are retained. The rear seat is wider than before and two collapsible revolving seats, which can be stored under the cushion in a compartment under the rear seats, are added, enabling five people to ride comfortably in the back half of the car. Three designs of body are made. The touring car, limousine and the landaulet. The last two accommodate the same number of people as the touring car and their upper lines conform with the lower half of the body. The top of the touring car body folds back to the level of the rear seats, the lining of the top folding in, just giving an unobstructed view to the rear.

All styles are finished in standard colors, according to the tastes of the purchasers, running gears and bodies being finished in the same or different colors. Upholstering. The front seats are individual and, like the tonneau ones, are heavily upholstered. Extra tonneau accommodation is given for two by revolving side seats, neither of which interfere when entering or leaving.

RAMBLER LINE FOR 1906

THE 20-25-HORSEPOWER FOUR-CYLINDER 1906 RAMBLER CAR

ONE OF THE interesting trade announcements is that three 1906 Rambler models will have vertical four-cylinder motors with transmission through a sliding gear set. Thomas B. Jeffery & Co. have previously always been content with machines carrying horizontal motors beneath the body, driving through planetary gear sets.

The Rambler menu for next year embraces seven models, two used this season that are being carried over and five new vehicles. Those carried over are the surreys, types one and two, the former an 18-horsepower side-entrance five-passenger car, with a two-cylinder opposed motor, and driving through a two-speed and reverse transmission, with single chain drive, and the latter a 20-horsepower motor, of similar design, with drive from the transmission shaft to a counter shaft by single chain and from the counter shaft by side chains to sprockets on the rear hubs. Both of these models have been retained without change except a few details in the transmission gears and the use of an aluminum crankcase in the larger model.

Of the new machines, surrey type three is fashioned largely after the lines of types one and two except that the wheel base is made 100 inches. The power plant is an 20-horsepower two-cylinder opposed motor, placed lengthwise beneath the body with the planetary gear shaft axially in line and final drive through single chain to a sprocket on the spur gear differential. The Rambler runabout for the coming season will be a two-cylinder vehicle rated at 10-12 horsepower with standard motor and transmission parts and single chain drive.

It is natural to expect that the three four-cylinder cars will prove the interesting models. They are officially known as types fourteen, fifteen and sixteen, the first a 20-25 horsepower light touring car with cylinders having a bore and stroke of 4 and 4½ inches, respectively, and the last two are fitted with motors with 5 by 5½-inch cylinder measurements and rated at 30-35 horsepower, one being a five-passenger side entrance touring car and the other is a limousine, with chassis identical with the touring car, and a body design fashioned on the most approved lines and finished in keeping with its design. One feature of type fourteen is shaft drive, while double chain drive is used in types fifteen and sixteen.

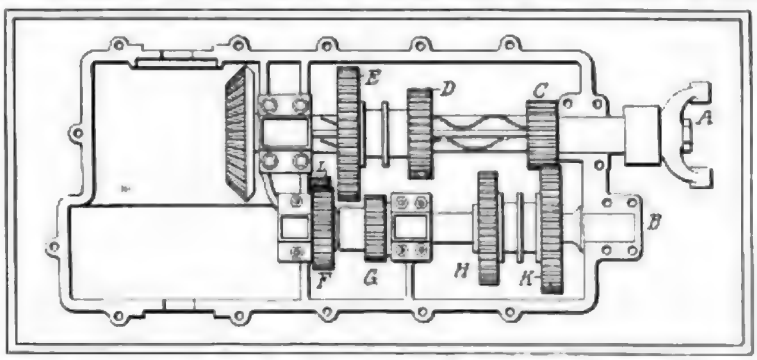
In keeping with Rambler construction during the present season the use of ball bearings in the road wheels is continued, the bearing construction not varying from the standard lines. In the front wheels the steel cone A threads onto the end of the spindle B and between this and the steel cup C, of hook-like design, the balls are retained. For adjusting the balls, the nut F within the hub cap is adjusted and between this and the bearing cone is a washer E, anchored against rotation. The bearing cup C rests against the hub part D of the wheel. The weight of the machine is carried in the steering knuckles by the balls G retained between the horizontal rings H, the lower ring resting on the hub K of the steering knuckle spindle and the other connected with the jaw part L of the knuckles.

Rambler radiators have always been a conspicuous feature—in fact, a distinguishing mark on the machines—and the vertical flat tube type introduced on the four-cylinder machines is also unique. Flat brass tubes of approximately 4 inches in depth but very narrow and equal to the height of the radiator in length are placed side by side and connected at the top and bottom with water tanks. The tubes are soldered in place and are held apart throughout their length by cross bridges. For assisting in cooling a fan is carried back of the radiator, being belt driven. Conspicuous in connection with the fan must be noted the stamping of the blades out of one piece of metal. The fan blades are riveted to a metal hub and carried to a metal rim, which protects the outer ends of the blades and retains them in position.

In main frame construction in the 30-35 horsepower car the use of pressed channel steel parts throughout is in keeping with modern practice. The side pieces have a depth of 4⅛ inches in the center, tapering to 1⅞ inches at the front end and 3 inches at the rear end, are narrowed alongside of the motor, and in order to permit of a three-point suspension of both the motor and gearcase a few differences in the disposition of the cross pieces is found. Where the side pieces narrow is a pair of deeply dropped channel pieces placed back to back and on these rests the back end of the motor. Nearer the front of the frame are two motor support braces, running from the side pieces to a cross piece. These braces have a long taper union with the side pieces, to which they are riveted, and carry the two arms on the front end of the motor, completing the three-point suspension system. Each of the braces is riveted to the cross piece near its center. For the transmission support two cross pieces are used, one furnishing a single broad support for the front end of the gear box and the other carrying its two rear corners.

Owing to the use of full elliptic spring in the rear, and having the same pivoted on top, the frame side pieces are slotted at the rear ends, through which passes the rod to which the springs are pivoted. The rod is made rigid with the frame by bearing blocks resting on the bottom of the channel on which the spring rod rests, both being retained by clips. The semi-elliptic front springs are bolted to forged spring hangers, the latter being long and having a shoulder abutting against the front cross piece of the frame. At the rear ends the springs are attached in the usual manner. Both sets are 40 inches in length and are clipped to axle seatings brazed in position.

In the 20-25-horsepower machine slight



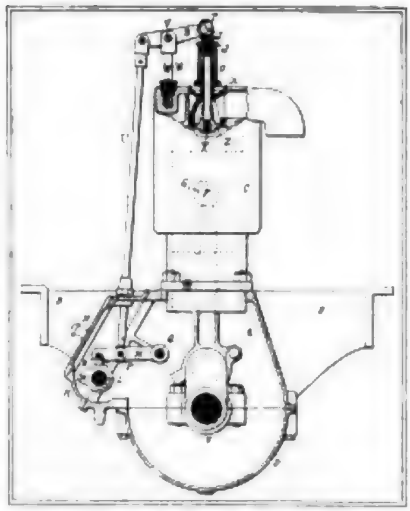
TRANSMISSION SET OF THE FOUR-CYLINDER 30-35-HORSEPOWER RAMBLER

Digitized by Google

differences in frame construction are used because of the shaft drive. A sub-frame is used which is fastened in front and rear to cross pieces. It is on the same level as the side pieces of the main frame, but the cross pieces within it are dropped to give a low center of gravity. Three point suspension of the motor and gearcase are features here also. Front axles in both models are centrally dropped and made from tubing, with a 5-16 inch wall in the larger car and ¼-inch in the smaller one. To the tube ends are brazed the jaw type steering knuckles. Thirty-two by 3½-inch tires are used on the small car and 34 by 4-inch on the larger model.

The motors of the two machines are practically alike, except as to size. The four cylinders are separate castings, with the valves placed side by side in the heads, the use of valve ports thereby being eliminated. The valves are operated by overhead valve levers of walking beam pattern and similar ones within the crankcase in connection with the camshaft. Accessibility in the way of removing the valves or the camshaft and also in the examination of the crankshaft bearings and connecting rods, has been planned. The use of special nickel babbitt in all motor bearings, with grooves for distribution of lubricant, is noticeable.

The crankshaft is a three-bearing drop forging ground to finish, and has hand scraped bearings. The cylinders are ground to a fit, assembled, and then put on a testing stand, where they are run by a steam power and polished to a mirror finish by the use of crocus and oil. Pistons of the straight side and flat top style are used, each carrying three sets of double compression rings, two above the piston pin and one beneath. On the bottom part are four oil grooves for catching the splash. The connecting rods, of I-section drop forgings, are split at the top so they can be clamped on the hollow piston pin. The pin has its bearings in the piston journals and is fitted with two oil holes in each journal, so that the oil enters the ends of the pin and flows toward the center into the bearing. The pin is held from end movement by spring ring in a groove



End Elevation Four-Cylinder Motor

in the piston. To do this the end of the piston journal is cup shaped and into this is sprung a steel ring, which in case the connecting rod loosened on the pin the ring would prevent the pin from scratching the cylinder walls. The lower end of the connecting rod has a hinged cap secured at the loose side by nut and spring lock nut, the top part of the nut being concaved to receive the cone-shaped split lock nut.

In the end section of the motor the general construction of the cylinder and crankcase and the method of actuating the valves may be studied. The top part of the crankcase A is an aluminum casting supported on the main frame through the arms B, each resting on the engine support braces. The base D serves only as an oil basin, the three crankshaft bearings being carried at the top part of the case. On the right side of the case are inspection plates H, which when removed disclose the camshaft and valve actuating parts, as well as the crankshaft and connecting rods. The arms B on the case being between the first and second cylinders, two inspection plates suffice, one small one at the front for examining the first cylinder part and a long one behind it for the parts of the three rear cylinders. The valves in the cylinder heads are placed so that the inlets in the two front cylinders are adjacent and the same position is used in the rear cylinders in order to facilitate the inlet piping. The valve cages X screw into the cylinder heads, the opening in the head being ground for tight fit. The valve heads Z are beveled to 45 degrees and have the steel stems Y screwed in place and finally riveted. By having the valve cage made with a long sleeve on top for carrying the valve stem the latter is protected throughout its length, and surrounding it is the valve spring O resting on a flange on the stem sleeve and retained at the top by a nut J secured by a locknut I on the valve stem.

Valve movement starts from the camshaft L placed in a separate compartment, well removed from the crankshaft, so that adjustments can be made with the connecting rods without the camshaft and its parts interfering. On the shaft are the integral double cams M, the inlet and exhaust for each cylinder being in one piece and pinned in place. The cam lever N is pivoted at its inner end at Q, the opposite end carries the steel wheel R, against which the cams operate, and midway of the ends is a third steel roller P on which rests the lower end of the rod U, passing to the top of the motor, where it is pivoted to the outer end of the valve lever S. This lever S is pivoted at V to the support W, screwed into the cylinder head, and in its other end receives the part T for pushing the valve stem. Peculiar in connection with the part T is that the end resting on the valve is rounded, so that when the lever S forces the valve down the action of the rounded end is practically the same as if a roller were used. By having T screwed in place the slightest adjustments are easily made, there being a slot in the head for receiving a screwdriver. Lowering the piece T increases and raising it lessens the valve lift.

To remove either the inlet or exhaust valves, the pivot bolt V, retained by a cotter pin, is removed and the valve lever

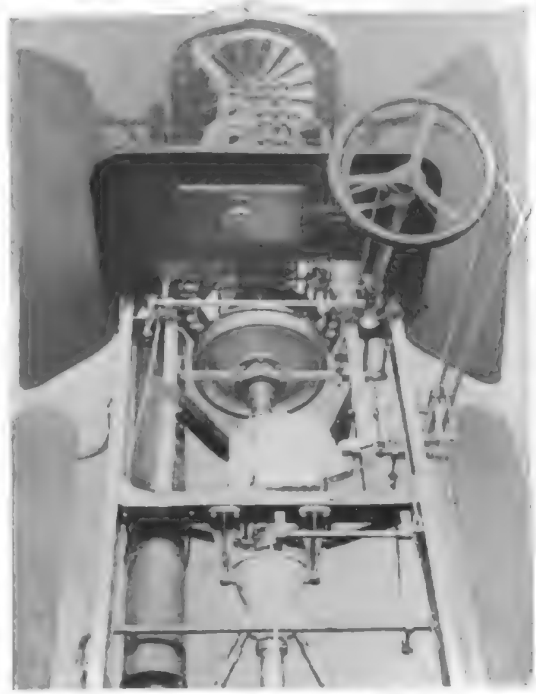
Detail of Rambler 1906 Muffler

S is lifted out of position and the valve cage, which carries a hexagonal nut, is unscrewed, when both valve and cage may be lifted. In removing the valve from the cage the locknut and nut J are taken off. Should it be necessary to remove the camshaft the entire camshaft casing K may be removed by taking off a few nuts before removing it.

In the ignition scheme Rambler-made spark plugs are placed angularly in the sides of the cylinder heads, below the inlet valves, and the electric current is supplied from storage battery, supplemented by dry cells. The circuit connects with a coil on the dash and with a commutator carried on a vertical shaft driven by the camshaft. The commutator is placed beneath the center part of the dash and slightly above the footboard. In all wire terminals the screw type of fastening is dispensed with. At the spark plugs each high tension wire ends in a hook, held to the plug head by a C-shaped spring on the plug and where the wires connect with the commutator they are provided with a split globular ball that fits into socket terminals in the commutator, making it only necessary to force the ball into the socket and to remove it by a jerk. The commutator, also of Rambler design, is unique in that the four wire terminals are not moved in advancing or retarding the spark. Within the casing carrying the terminals is a ring piece with segment parts that rest against the contact connections. These connect with the contact points. In advancing or retarding the spark the ring part is shifted.

The control of the Rambler is different from other machines in that the spark cannot be shifted without affecting the throttle control, there being no separate spark lever. Both spark and throttle are connected with the ring beneath the steering column, so that to increase speed the throttle is opened and the spark advanced until a certain speed is maintained, when the spark is then in its most advanced position. After that further engine speed is gained by using an accelerator. Another touch of home manufacture is found in the new carbureter, which is of the automatic type, with auxiliary air valve under spring control. By placing the carbureter close to the motor simple piping serves for conducting the gases. The piping is made from aluminum with brass unions, and has ground joints. The exhaust piping is an integral casting with four branches.

The new muffler is fashioned on cylindrical lines, being of medium diameter but very long. It is carried lengthwise beneath the frame at the left. The interior of the cylinder is divided into several equal sized compartments by a series of cone-shaped plates arranged in pairs, two forming each partition. One is secured to a central pipe in the muffler and does not reach the muffler casing, and the other contacts with the casing but does not extend to the center. Between these two parts is a space through which the gases pass from one compartment to another, leaving one between the plates near the muffler casing and passing into the next compartment near the center, the flow of gases thus following the line indicated by the arrows.



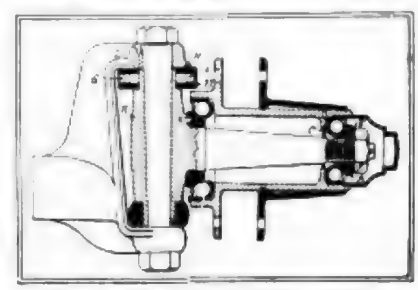
Chassis of the Shaft-Drive Rambler

Transmission from the motor is through a leather-faced cone clutch, held in engagement by a heavy coil spring surrounding the clutch hub, which has its bearing on a continuation of the crankshaft, a race of ball bearings taking up end thrust when the clutch is engaged. A feature of the device is that the clutch spring is entirely enclosed and runs in oil. For engaging the clutch, a squared cross shaft on the car frame with a depending yoke engaging the collar of the clutch sleeve is used. To facilitate engagement and disengagement a compound pedal is used, so that a long loverage is gained, giving good foot movement on one end of the pedal and short movement of the clutch on the opposite end. Between the clutch and gear case on the large car is a double universal joint and in the smaller car a telescoping shaft is used.

Within the gear case, which follows typical construction throughout, are the main and countershafts A and B, placed side by side, with bearings between the halves of the gear box. Plain nickel babbit bushings are fitted and in lubricating an oil bath is used. As a precaution against grit getting into the bearing, wire screens are placed in the bottom of the oil cups on the bearings. Three forward speeds and a reverse are given, the first with direct drive by using the internal toothed gear D on the square main shaft, meshing it with the master gear C on the end of the clutch shaft. For the second speed the drive is to the countershaft through the gears C and K and back to the main shafts by gears H and D, for slow speed gears G and E are meshed and for the reverse an idler L is used between gears F and E. On the main shaft are angular oil grooves to ease the movement of the sliding unit formed by the gears E and D. Final drive, in the larger model, is by a differential countershaft and double side chains. The gear case illustration is of this model, with the differential cross shaft omitted. In the chassis illustration of the shaft drive car the novelties in the drive can be followed. The propeller shaft has but one universal joint and that at the front end, enclosed within a conical aluminum casing, which screws into the casing for the shaft. Two angular braces from the rear axle to the casing make the latter rigid with the rear axle. The joint casing has its support in two brackets secured to the frame cross piece, the casing trunnions having bearings in the brackets. These bearings are directly in line with the axis of the joint, the construction giving a rigid casing with one pivoted point between the axle and the frame, and as the rear springs are compressed pivoting them at the top gives the result gained by having sliding joints in the shaft. All changes in speed are gained through one lever. Spur gear differentials are used in all models.

Three brakes are fitted, one working on the differential and in both cars enclosed within the differential casing, and two emergency brakes working on the rear hubs.

The bodies of both models are alike and are characterized by having the back of the rear seats only a few inches higher than the front seats, with wide side doors; individual front seats, and hollow metal dash.



Rambler Ball-Bearing Front Hub

THE STEVENS-DURYEA LIMOUSINE

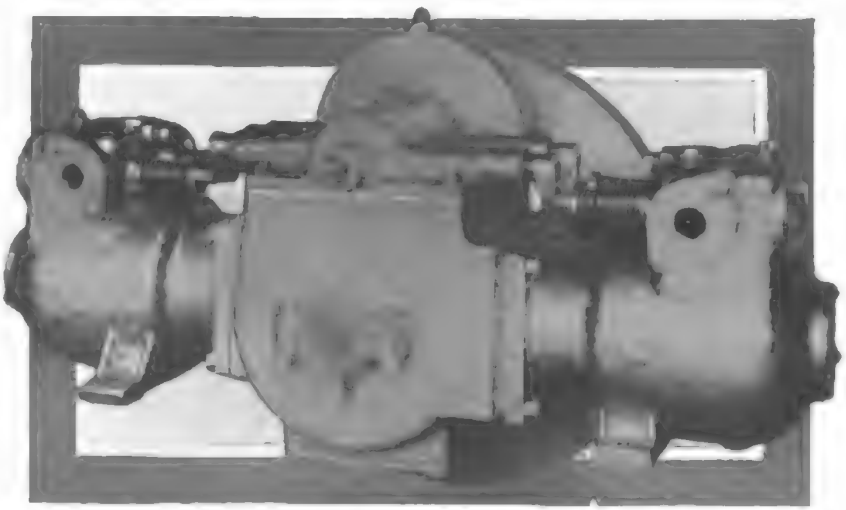
The Stevens-Duryea limousine, a product of the J. Stevens Arms & Tool Co., of Chicopee Falls, Mass., has the regular chassis of the Stevens-Duryea car marketed during the present season. Noticeable in the construction of this chassis is the 20-horsepower four-cylinder vertical motor, which, together with a multiple disk clutch and sliding gear transmission gear set is carried within one case, the whole casing having a three-point suspension, two of the supporting points being on opposite sides of the front of the crankcase and the third point at the rear of the center of the gear case. Final drive is through a jointed propeller shaft. The use of a subframe is eliminated and the simplicity of the main frame is worthy of note. The side pieces are parallel throughout their length and are tied together by cross pieces, one supporting the back end of the gear case and two near the rear of the frame, the front ends being connected by the two motor lugs that rest directly on them. The flywheel is carried on the front end of the crankshaft, just above the front axle.

The limousine body does not follow radical lines in design, the curves being similar to those used in several limousine designs. The rear corner curves are not large or of the king of the Belgians type, but decidedly easy throughout, an effect which is increased by the scroll-like bottom of the side entrances. Large windows —square in the doors and practically square in the sides and back—as well as a large one above the back of the operator's seat, provide excellent light. Pull curtains, speaking tubes, electric lights and all of the other limousine luxuries are installed. A canopy projects over the driver slightly further than the top of the straight dash and sliding glass front and drop side curtains are wet weather additionals. The front seat is not divided, change speed and emergency brake levers are at the right and on the steering column are other controlling devices. The arched-top hood with gilled sides and honeycomb radiator are used. Running sideboards, mechanically attached tires and very large front fenders are other features. The body finish as well as the upholstering is up-to-date and in colors to suit the purchaser.

A WELL-DESIGNED CINCINNATI-MADE MOTOR

Accessibility, now the watchword in automobile construction, is prominent in the 16-horsepower two-cylinder opposed motor built by the A. Streit Machine Co., of Cincinnati, O. Accessibility to the crankcase is obtained by having the case made in cubical-box form, with the top a large opening, over which the cap carrying the camshaft and push rods is attached, so that when the cap is removed the camshaft and push rods are removed, disclosing the crankshaft and connecting rods and not in any way interfering with the adjusting of any of the motor parts. In the ends of the crankcase are large openings, over which the cylinders are bolted and the bottom of the case is a removable plate. Support in a car frame is through lugs on the bottom of the cylinders. The case is not split for inserting the crankshaft, the shaft being carried in bearings carried in large plate pieces bolted into the case ends. Integral cylinder castings, with the valve ports above the cylinder heads, are features in keeping with general accessibility. Mechanical valves, placed side by side, with the valves held to their seats through the usual coil springs, are used, but the position of the valve stems and push rods differs from the ordinary. On the ends of the push rods are depending feet, against which the ends of the valve stems rest, making it easy to remove the top of the crankcase and the push rods. In taking out the valves, screw caps in the ports directly in line with the valves have to be removed, when the valves be drawn out. The inlet and exhaust pipes enter the ports at the sides, and holes for the spark plugs are in the tops of the ports, allowing the plugs to be fitted vertically, in order to facilitate wiring and render removal easy. The internal construction of the motor is standard in practically every way, and with a bore and stroke of 5 inches the rated horsepower is furnished at normal speeds. The crankshaft is made with a diameter of 1¾ inches and has bearings 3½ inches long. The wristpin bearings are 1¾ by 3½ inches. The cylinder walls, pistons and piston rings are ground to standard size and babbitt bearings are furnished throughout. Complete, the motor weighs 375 pounds, 135 of which is taken up in the flywheel.

Lubrication is by either gravity or positive oilers, the reservoir in each case being located near the motor and supplying lead to the cylinder walls and crankshaft bearings. The crankshaft and cams are dependent on the splash. Pipe for conducting water from the radiator to the water-jackets can be coupled to the ports.



STREIT 16-HORSEPOWER OPPOSED MOTOR

From the Four Winds

THOUGHTFUL MOTORISTS LOOK OUT FOR SAFETY OF THEIR FELLOW ENTHUSIASTS

Chauffeurs Provided—R. J. Jacobs, Box 565, Pasadena, Cal., offers to find competent chauffeurs for owners contemplating wintering on the coast.

Lost Car Reclaimed—Joseph E. Hannon, a Los Angeles attorney, has just recovered a car lost in a peculiar way. A repair man was returning it when it broke down, so that the repairman was forced to leave it and go back to the shop. The police picked it up as a stray and held it until finally Hannon claimed his orphan.

Fighting Dust—In Paris the authorities are testing a new dust-laying preparation, a tarry compound which is spread over the roadway by means of the Lasally system. It is first rendered inflammable and then heated in a machine, afterward being transferred to the distributer, which is fitted with four brushes, which move up and down, and spread the compound evenly. Another method being employed is a preparation styled odocreole, which is mixed with water to the extent of about 30 per cent. The operator carries the odocreole in a small tank on his back, which is connected with an ordinary hose running to a water plug.

Delays Show Allotments—There will be a slight delay in the announcement of the allotment of space at the Chicago show, due to the fact that the applications so largely exceed the available space. All of the space set aside for accessories in the gallery has been allotted by the Motor & Accessories Manufacturers. For space in the automobile section, which occupies the main floor of the Coliseum and the first floor of the annex, there are eighty-seven applicants, who desire to show 368 cars, and who apply for 224 spaces, aggregating 62,845 feet. The number of spaces available is 131, aggregating 39,497 feet. The management seriously considered the erection of a supplementary gallery 18 feet above the floor, 30 feet wide and running around the building. This would have furnished about 18,000 feet additional space, but was abandoned on the advice of the building commissioner, because of the danger of fire in view of the enormous quantity of lumber required in its construction. The announcement of the allotment will be made in about a week.

Thomas Oil Advocate—E. R. Thomas, of Buffalo, is about to start a movement in favor of oiling the roads in the vicinity of that city and will endeavor to induce the Buffalo Automobile Club to take up the matter.

Another Test—The New York Motor Cycle Club will hold a regularity and judgment run on Sunday, November 12, instead of election day, as first planned. The run goes from the club house at 10 West Sixtieth street to Bedford, N. Y., and return, the total distance of 90 miles to be covered at the average rate of 15 miles an hour. A special prize will be given to the motor cycle coming nearest the exact schedule.

Weaver Helped—The whirlwind campaign which the city party in Philadelphia has been waging against the boodlers and grafters would have been impossible were it not for the automobile. On Thursday night of last week Mayor Weaver spoke at Bustleton, in the extreme northeastern section of the city, and at Paschalville, in the extreme southwestern part, the two points being fully 23 miles apart, besides addressing two other assemblages en route. The route followed by the mayor is thickly settled, and extreme speed was impossible, yet his honor kept his engagements to the dot.

At It Again—Just when the public had come to the conclusion that the fight between the automobilists and the authorities of Grand Rapids, Mich., had been forgotten, the war has broken out again. Halloran and Dunn, who have become famous in this part of Michigan for their efforts along the line of arresting automobile statute violators, have put their stop-watch in operation again. Four arrests under the statute have been made and more are promised. Although the automobile club is still quiet, there is something in the air. Four hotelkeepers, one of whom conducts a hotel partially owned by Mayor Sweet, are awaiting trial in the superior court on a charge of keeping their bars open on Sunday. The arrests were made, it is said, at the behest of an agent of the automobile club.

Aero Club Growing—Sixty-four of the 100 members desired by the Aero Club of America for its founders' membership have been secured. The list is expected to fill up before the end of the month. The library committee is collecting a valuable lot of data about aeronautics with the idea of having the finest library in the world. Coöperation of leading experts has been promised.

Motor Cycle Test—Sixteen out of eighteen entries started on the tri-car trials of the Auto Cycle Club of England, running from Uxbridge to Wheatley and Banbury, returning by way of Aylesbury, a distance of 124½ miles. Thirteen finished. It was a combination non-stop, consumption and brake test, with a timed hill climb thrown in. The average consumption of the thirteen cars that finished was 3 gallons 1 pint for the 124½ miles. H. G. Priest on a Quadrant was first home, while V. Riley on a 9-horsepower Riley was first in the hill climb, going up the 1180 yards of gradient varying from 1 in 11 to 1 in 16 in 1 minute 51 4-5 seconds. The awards have not been made public. A. Hooydonk in a 4½-horsepower Phoenix tri-car, traveled the entire distance on 14 pints of gasoline.

Has Judge Guessing—Frank Smith, of Syracuse, N. Y., is giving the authorities considerable food for thought and County Judge W. M. Rose is unable to decide whether or not he is a criminal or just foolish. The question to be decided is whether a man who forges a check to get an automobile when he knows that he will have to forge another before he can buy gasoline to run it is in his right mind or not. Smith was recently arraigned in the county court on an indictment charging the forgery of a check for $30 upon the Farmers' National Bank of Rome. He pleaded guilty to the charge, saying that he wanted to get an automobile. He is 22 years old and says he comes from Vermont. On account of his silly smirk Judge Ross thought that perhaps he might not be right in his mind and held the case open for investigation.

Inventors' Chance—The inventor who can produce the best automatic starting device for the motors of automobiles will have a chance to pull down a nice slice of coin, Henry Deutsch de la Meurthe having offered $2,000 for such a device, the prizes to be awarded by the Academie des Sports. The money will be divided. The first competition, for which $1,000 will be given, will be held next month, while the other will be during December, 1906, both to take place while the Paris salon show is open. The Automobile Club of France drafted the rules. The devices must be submitted in working order on a car having a one, two or four-cylinder engine, but if of the four-cylinder type the engine must be of at least 20 horsepower. It must be capable of being operated from the driver's seat, and must work equally well with the engine cold or warm. The jury in making its awards will take into consideration, among other

Digitized by Google

points, those of weight, size, simplicity, price, cost of upkeep, ease of action and facility for fitting to existing cars. Drawings must also be submitted, but will not be judged.

Mileage Rivals—There is no little rivalry as to who holds the mileage record in Hartford, Conn. Leonard D. Fisk has done 60,000 miles in his Panhard, while Dr. Emil G. Reinart has driven a Mark XII Electric runabout in his practice 25,000 miles making his rounds.

Plunge Into River—An English motor car took a plunge into the Mersey recently. It was being taken onto a ferry when the canopy top fouled some of the deck fittings. At the same time the crew eased the steamer forward and the driver of the car started slowly. He was on the gangway when the plank dropped and the car went with it. A woman passenger and the driver were rescued by two bystanders.

Fighting Scorching—The scorcher in Milwaukee has discovered that he is up against it. The police force is after him and its efforts are backed by the moral support of the Milwaukee Automobile Club and many owners of machines who are not connected with the organization. The police authorities have marked off a stretch on Grand avenue where the scorchers generally succumb to the temptation to hit it up. The space is accurately measured and police officers with stop-watches occasionally camp there for a while and time a few machines. The result is usually a visit to the police court on the part of some chauffeur who became unduly enthusiastic.

A. C. A. Ticket—Dave Hennen Morris has been renominated for the presidency of the Automobile Club of America. The other nominations are: For first vice-president, Colgate Hoyt; for second vice-president, Frederick G. Bourne; for third vice-president, Clarence Gray Dinsmore; for treasurer, W. S. Fanshawe; for governors to serve 3 years, Colonel John Jacob Astor, George F. Chamberlin, Schuyler Skaats Wheeler; for governor to serve 2 years, William Pierson Hamilton; for governor to serve 1 year, John E. Borne. These nominations will be voted upon at the annual meeting on Monday, November 20. There is no likelihood of an opposition ticket.

New Tag Man—H. M. Cutshall, ex-member of the legislature, has been placed at the head of the state automobile bureau, a sub-department of the highway department of Pennsylvania. On and after January 1 next all automobile licenses and tags will be issued by this bureau instead of by the prothonotaries as formerly. The new law requires a tag on both the front and rear of each machine, these to be issued with the license. Unless local offices are opened in the larger cities of the state much trouble is likely to follow the simultaneous dumping upon the bureau authorities of thousands of applications immediately upon the opening of the new year. Nothing covering this apparent defect of the new law was incorporated in the bill as it passed the legislature, and Pennsylvania automobilists anticipate much inconvenience and delay unless something is done to remedy it before January.

New Uses for Car—An automobile led the grand march at the ball given last Thursday by the employes of the New York branch of the Pope Mfg. Co. at Manhattan casino. When the motor car is taught to dance there will be no more wall flowers.

Enterprising Hawkeyes—Newton, Ia., is proud of the growth of motoring in the town, twenty cars already being owned there. An automobile club is being talked of and one Newtonite, Thomas Balmer, is about to branch out and manufacture runabouts.

Warns Motorists—Participants in the recent economy test of the New York Motor Club appreciated the forethought of the Richmond County Auto Club, which has been carrying on a good roads campaign and which has posted warning signs at bad curves and dangerous hills throughout the county.

Means Business—Chief of Police Kiely, of St. Louis, is most strenuous in his crusade on automobile scorchers. Besides instituting a shotgun patrol, he has included the down town district in the territory to be covered by the cars manned by the police. It is charged that motorists dash through the crowded streets, paying no heed to the heavy traffic.

Car Lost—A careless Trenton, N. J., young woman lost her brother's automobile the other day, and, although she called on the police to help her, no trace of the machine can be found. She took the car out for a little trip, and when a few miles out in the country something went wrong, and of course she didn't know what it was. Leaving the car in the middle of the road, she went home and told her brother about it, and although he went to the scene of the breakdown at once, nothing could be seen of the car.

Motor Cyclists Suspended—W. T. Marsh and A. A. Hoyt, prominent in the motor cycling trade, it is announced by the Federation of American Motorcyclists, have been suspended from the national organization following the preferment of charges of disloyalty, conduct unbecoming members and prejudicial to the interests of the Federation of American Motorcyclists. The complainants ask for the expulsion of both men. According to F. A. M. officials, the trouble arose over the decision of a referee. He ruled a special racing machine out of a race restricted to stock machines, and the makers of the machine were so incensed that they attempted to form an organization to control the sport. The F. A. M. officials allege that the organization was formed merely by printing a letterhead bearing a title and the names of three so-called officials, all of whom were employees or attaches of the manufacturers concerned. The latter then hired a track and held two outlaw race meets. The riders who competed were all promptly suspended, four of them for life. Marsh and Hoyt are charged with having assisted these several movements, and also with serving as officials at the outlaw race meets, it is claimed.

Seeks Site—The Milwaukee Automobile Club has not yet decided on the location of its new quarters, but a special committee is considering several eligible sites. The new quarters will be opened by the first of the year, if not sooner, and the members of the club are looking forward anxiously to this event.

Queer Charge—Charles Vogele, of the Vogele & Dunning Candy Co., of Toledo, Ohio, and William Luck, of Detroit, while going through Milan, Mich., in an automobile, found the street blockaded with the hose of the fire department, which was engaged in practice. The firemen making no attempt to remove the obstruction, the automobile was run over it. The firemen promptly turned the hose on the autoists and the force of the stream was so great that Vogele was knocked from the machine. Warrants have been sworn out on a charge of assault and battery.

Fear for Road Race—Cable advices from Havana state that subscriptions are coming in so slowly that there is danger of the Cuban road race being abandoned. The race last year left a deficit of some $6,000, which was paid by the Havana Racing Association. This year a larger sum will be required and the association declares it cannot and will not stand the expenses. So those who derive the benefits are invited to come forward and drop their contributions into the hat. A promise has been secured to improve the roads a bit, but the city council is apparently fighting shy of the invitation to lend a financial hand. It is figured that $14,000 will be needed.

Is Shoe on Other Foot—Up in Cheltenham, Springfield and Whitemarsh townships, Montgomery county, Pennsylvania—the trap country just north of the Philadelphia line—it looks just now as if the automobilists who have contributed no little during the past year toward fattening the treasuries of county and township were going to have an inning. It appears that the money collected in fines is to be applied to road improvement, and the most urgent use that could be found for it was in paying the cost of widening Church road, one of the automobilists' favorite stamping grounds. The township and county authorities agreed, and the road was widened from 33 to 40 feet, just about using up the $3,700 collected in fines—according to the calculations of the authorities. It now appears, however, that the awards to those who own the various expensive properties abutting on Church road are grossly inadequate and up to date about thirty appeals have been filed against the action of the road jury. Present appearances indicate that before all hands are satisfied fully $7,000 or $8,000 will have to be paid for the work, and now the automobilists are chuckling to themselves at the mess their persecutors have made of things.

The Realm of The Commercial Car

Motor Wagons used by German Brewers

GERMANS have not been slow to appreciate the advantages of the motor from a commercial standpoint and as early as 1897 one of the Berlin breweries, the Bohemian, employed a gasoline machine in the delivery of beer. The great German industry of malting and brewing has been one of the first to utilize the automobile and has been the foremost in encouraging the economic and efficient construction of the machines by manufacturers, among whom the Daimler people have been the most successful. On the crowded business districts of the capital city the heavy keg and bottle delivery wagons are common sights.

The German commercial wagon looks every inch a business proposition, and intended for a decade and not a month of service. Americans attempt in many cases, in building commercial trucks, to produce a machine of graceful lines but lacking that important essential of a business wagon, rigidity and strength, intended to withstand the heaviest service. This is prominent in German cars, particularly in the wheel and tire construction; the wheels being of the heavy artillery pattern, with wide rims. In five cases out of ten they are shod with broad steel tires and in other cases heavy solid rubber tires are used on the front wheels and double rubber tires on the drivers. The shoe brakes, operating on the surface of the tires of the rear wheels, are not as graceful as hub brakes, perhaps, but the experience of German builders is that with the ordinary driver these brakes are less harmful to the car than hub brakes and work little injury to the tires. Brake application is by means of a heavy side lever. This type of brakes, it must be understood, is not used on all machines, but is very general on those weighing over 2 tons and capable of carrying 4 or 5 tons.

Another feature with the heavy German commercial wagon is the low speed ratio to the driving wheels. The salesman's story that "it is rated at 14 miles per, but can make 20 to 25 miles with ease," is not practiced in Germany, and as a result the heavy wagons are not racked to pieces in a few months by fast driving over rough crossings and poorly paved streets. Thanks to the government of German cities, poorly paved streets are as uncommon as well paved thoroughfares in many American cities, and as a consequence steel tires are much used on heavy wagons, the extra vibration occasioned thereby not injuring to any perceptible degree the motor and other running parts.

Load carrying appears to have been the watchword of every builder, whether the Daimler concern or the least known manufacturer. With good streets the 7-ton load, while massive to the limit, is not inconvenient in being piloted or propelled through the streets. Americans who have been accustomed to looking to England, Germany or France for the best in commercial construction, as well as in pleasure cars, may be slightly disappointed in finding that the vertical motor in front of the dash with the driver's seat behind it is still responsible for half of the carrying space on the chassis frame. In some cars the back of the seat is midway between the front and rear axles and the load carrying platform is consequently thrust far behind the rear axle and the control of the machine correspondingly impaired, as the skidding on wet streets and in winter seasons is much accentuated. The scheme of placing the driver above the motor, thereby making his seat high and so leaving more space for load carrying, has not as many followers as in England, the present leader in the commercial game. The heavy German driver perhaps finds it sufficient work to mount to the ordinary seat instead of having to do a step-ladder act where the seat is mounted over the motor.

It is generally asknowledged that the tube radiator with water tank is more serviceable for commercial trucks than the honeycomb type, but the German in a few cases disputes this point, even the Daimler concern using its familiar automobile radiator on many of its heavy trucks. The danger of rupturing this kind of radiator is great and the difficulty of repairing it is well known. The tube radiator, on the other hand, is strong, capable of resisting a good jar, and when damaged can be repaired by the ordinary mechanic. A touch of wisdom is found in the design of many of the cars fitted with the tube radiator in that it is hung beneath the car frame, with the front part of the frame protecting it in front, so that if the truck collides with other wagons the frame, in taking the brunt of the collision, protects the radiator.

The wisdom shown in centering the controlling devices of trucks around either a vertical or inclined steering column is general with all machines and the broad leather-cushioned seat with straight back is another touch of good sense. Rear fenders are unknown, the German having hit early upon the idea that on trucks they are the greatest of all nuisances. Many trucks have little fenders over the front wheels, but the present tendency is to dispense with fenders entirely or to make them as small as possible. In the line of lamps similar good judgment is met, the big style being properly exorcised

BOTTLED BEER WAGON OF THE JULIUS BÖTZOW BREWING CO., OF BERLIN

Digitized by Google

and a pair of the smallest headlights, carried on the top of the dash, substituted.

The Bohemian Brewing Co., one of the half-dozen big malting houses, has now the largest stable of automobiles in Berlin, twelve motor wagons, traveling out daily from the brewery, doing the distributing and collecting business. Most of the cars cover at least 63 miles and some more than that distance each day in going to and from the suburbs, such as Wittenberg, Buchholz and Trebbin. The first motor wagon purchased in 1897 is still doing its daily routine with the rest of the stable. One of the big wagons used by this company in distributing to the keg trade has the rear wheels fitted with shoe brakes and, in spite of the heavy appearance of the car, skims over the cobblestone pavements with comparative ease. The broad rear wheels contribute much of the ease with which the vehicle travels. Flat-iron tires are used. The driver sits in front, just in the rear of the motor, and controls through a vertical steering column.

The Bohemian brewery uses also a bottle wagon of the broad-tired type with a box bed. It is a product of the Daimler concern and is conspicuous by a high box body with several decks for bottles. Carrying space is increased by crowding the vertical motor well over—in fact, ahead of—the front axle, leaving ample carrying space.

A large 10-horsepower machine, with iron tires, built for the bottle trade, is used by a prominent brewery and has the rear wheels much larger than those in front, giving the machine a wagon-like appearance. It has an American type of rack for containing the cases of bottles.

The Daimler firm has built two heavy bottle wagons for the Aktien brewery. They are two-cylinder machines, yielding 16 horsepower, with the two cylinders huddled beneath a Renault design of hood, except in that the radiator is hung low in front of the axle. Both have the hay-rack style of body, which is well suited for carrying cases. The road wheels are of wood, artillery pattern, with wide steel tires and brake shoes. The Versuchs company uses similar wagons. One of the old high wheeled type has an enclosed body and short motor box. The operator sets on top and looks much like a circus wagon driver on the highest point of a van. The other wagons are of the more modern type, with long wheel base, the driver sitting at the rear of the hood. The brewery has a large

THE SCHULTHEISS BREWERY'S IMMENSE KEG BEER WAGON

outlying trade and the machines are frequently called upon to travel long distances. The company has a well-fitted repair shop where the cars are thoroughly overhauled every night and prepared by expert machinists for the heavy work of the following day.

Perhaps two of the newest and best delivery wagons in Berlin are operated by the Schultheiss brewery. They are two-cylinder motored machines of Daimler make, each yielding 8 horsepower, and travel at an average speed of 10 miles an hour over all sorts of pavements. The wheels are broad and the tires are of heavy rubber. They are capable of carrying 7,920 pounds of merchandise, have been in use since the first of May, and have needed only minor repairs. Both are for the bottle trade and have very commodious enclosed carrying compartments, with top rails for carrying large cases of bottles. Double tires are used on the rear wheels and single in front. The same house owns a large wagon for the keg trade, being a machine weighing 6,300 pounds and carrying 3-ton loads. It has bar sides, solid tires and surface brakes. The 8 to 12 horsepower motor yields an average speed of 7½ miles per hour. This machine has been in use a year and is in excellent working order, although its weight-carrying capacity is nearly every day tested to the utmost. The company, in deciding upon the machine, selected this one because of its ability to make hurried runs. Frequently heavy deliveries are made to outlying sub-stations and quick return runs are then made with empty kegs. The truck has been particularly successful in its tests. Fifty kegs are carried with ease and in emergencies any number of additional kegs can be heaped on top.

The wagons used by the Botzow brewery are 20-horsepower machines, weighing 6,600 pounds each and carrying 3-ton loads. They make two and three trips daily through the business districts, covering about 70 miles each. The wagons were put in service at the first of the year. The broad rubber tires, solid in front and double behind, make the going practically free from vibration.

CANDY MAN USES MOTOR CARS

J. George Smith, of St. Paul, Minn., is an automobile enthusiast who can give some valuable pointers on turning automobile enthusiasm into practical channels. Incidentally, Mr. Smith is a retail confectioner, who holds the exclusive and fashionable trade of the city in a grasp which has aroused the envy of all competitors. Five years ago he put into commission the first regular automobile delivery wagon in St. Paul, a Waverley electric, and the original

VARIETY OF AUTOMOBILES USED BY J. GEORGE SMITH, OF ST. PAUL, MINN., IN THE CONFECTIONERY TRADE

Digitized by Google

car is running today, with three more as companions. When Mr. Smith embarked in the automobile field in 1900, Smith's automobile delivery stirred the interest of the entire city. Recently automobile deliveries became so numerous that something was necessary to keep the interest centered about Smith's, and the Waverley factory has recently turned out to order a new car, described recently in MOTOR AGE. Two electric deliveries, an electric runabout and a Pierce Great Arrow make up the Smith squadron now, but the cars are only a small part of the equipment of the establishment. The confectioner has taken an ordinary store building on Sixth street, the most fashionable business street of St. Paul, and has built into the rear, facing on Automobile alley, a private garage holding three and, in a pinch, four cars. In this garage are three charging plants, and on the curb in front of the store is another charging plug. As a finishing touch, Mr. Smith has

MR. SMITH'S GARAGE IN THE CELLAR OF HIS RESIDENCE

turned the basement of his house, in the residence section on St. Anthony hill, into a garage capable of holding the three electrics; and has for the past 3 years been running a 50-lamp electric lighting system from the batteries of one of these cars. The Smith store on Sixth street is at the corner of the alley, next to the Metropolitan theater. The building is 23 feet wide, and the salesrooms and ice cream parlors extend back to within 10 feet of the rear end. The back of the store has been narrowed down to 15 feet, and Mr. Smith is left with an L-shaped space outside the walls of his salesrooms, which at the widest part is not more than 10 feet. Large double garage doors were put on the alley side of this space, so that nearly the entire side can be thrown open, and under proper manipulation four cars can be stored there. The garage is equipped with all necessary apparatus, abundant charging apparatus, and leaves the confectioner absolutely independent of repair shops, washing stations storage houses and other garage features.

Mr. Smith estimates that the charging of his batteries does not cost on an average of more than $4 or $5 per month for each car. This includes the new electric, which carries over 200 small incandescent lights; and also includes the charges which are turned through the private lighting system in his residence. Outside of this expense and battery repairs, which he estimates at $50 a year, there are practically no expenses except the salary of the man who runs the car. Each machine makes about 10,000 miles in a season. The new electric is running from 30 to 40 miles each day, and it is a fact that the Smith deliveries have never been tied up by serious accident. Mr. Smith does not allow any of the electrics to run beyond second speed, and many accidents are doubtless avoided in this way. Machines are kept constantly in charge at the curb, or in the garage, when not in service, so there is no giving out of power.

The house garage is something that was worked out with great pains by Mr. Smith. His house stands on a 40-foot lot and the entrance to the basement is from an alley in the rear. Here a cement decline nearly 60 feet long leads to the cellar, where big double doors allow the entrance of any of the machines, including the Pierce Arrow. It cost him $200 to construct the driveway, build up stone walls on the sides and properly drain the basement. He says a new house can be fitted with a basement garage at a cost of $100. At first water flowed down the cement driveway and flooded the cellar. An inside drain would not carry it off, and to solve the problem an outside 8-inch drain was placed just outside the doors. This cares for most of the water, and the inside drain takes the balance and at the same time acts as a drain for the washing stand in the basement. An extra set of batteries in the basement, charged from one of the electrics, gives storage power for the electric lights in the house.

Altogether, Mr. Smith has the maximum of efficiency and effect at the minimum of cost. Advertising is one of the strongest reasons for the popularity of Smith's, and the automobile deliveries have materially aided in this branch. The new Waverley has "Smith's" in electric lights in front and rear and electric lights above the sides, which illuminate the signs on the side of the car. At night the car stands in front of the store, drawing power from the plug on the curb and at the same time emblazoning "Smith's" upon the air.

BREWERS INSPECT BIG TRUCKS

English brewers are closely watching the progress of the commercial vans, as was shown at the twenty-seventh annual brewers' exhibition in Agricultural hall, London, 3 weeks ago, when four commercial vehicle manufacturing concerns—Jesse Ellis & Son, Messrs. Fodens, Savage Brothers and the Yorkshire Patent Steam Wagon Co.—were represented. Savage Brothers had their Little Sampson steam tractor, the engine being mounted on springs. Volute springs are fitted to each bearing at the rear axle and there is one laminated spring to the center of the front axle. The tank capacity is enough for a journey of 8 miles, drawing about 6 tons along an ordinary road. Besides the Little Sampson the Savages had a 5-ton steam wagon with a boiler of the locomotive type, with a fuel shoot at the top of the arch, so that the driver and stoker can easily get at their work of feeding the fire, or inspecting the boiler. Two special poppet type safety valves are fitted, one set to blow off when the maximum working pressure of 200 pounds to the square inch is reached. This connects with the muffler. The other valve blows off at about 10 pounds above the working pressure and is only used in the event of an accident to the other. The feed water heater consists of a chamber containing straight, cold drawn steel tubes, through which the feed water is forced, and which are surrounded by the exhaust steam. The rear axle is of the fixed type, and made of a solid rectangular forging. The double acting brakes will stop the vehicle on 12½ per cent gradients.

In the Yorkshire 5-ton steam wagon is used a boiler of the double-ended locomotive type, the engines being compound, with 4½ by 7½ cylinders. The rear axle is carried in spherical sliding bearings, arranged in such a manner that the gearing is not affected by the rise and fall of the wagon on its springs. Two speeds are provided, corresponding to 2½ and 5½ miles an hour. The boiler feed is a force pump, worked by the crank shaft, with an injector for emergencies. The brake gear is of the screw-down type, acting on both rear wheels. The tank has a capacity for 12 miles and has a steam water lifter.

The Ellis exhibit consisted of a 4-ton brewer's wagon, which can be used for either the barrel or bottle trade, with two speeds and a reverse, and with the main axle running in steel roller bearings. The Ellis patent water tube boiler is used. The Fodens' rig is fitted with a horizontal multitubular boiler and double crank compound engine. The machine is heavily constructed, has broad driving wheels, and is well suited for heavy service.

COMMERCIAL STEPPING STONES

Tri-Cars Used by the Westminster Gazette in Paper Delivery

Line for Kentucky—An automobile mail and passenger system is to be put in operation between Milton and Carrollton, Ky. It is proposed to put in a 24-passenger canopy-top automobile and to run it on regular schedule.

Entirely New—The Ohio Manufacturing Co., of Upper Sandusky, O., is building a specially designed gasoline traction truck, which, if successful in the use for which it is intended, will change the oil business in Ohio. The machine will furnish motor power for drilling and dressing tools, and will also carry a movable derrick from place to place.

Will Test Buses—The Motor Union of Western India will hold reliability trials from January 17 to 21, inclusive. From Bombay to Poona will comprise the first day's run and from Poona to Mahableshwar the second day. A hill climbing contest is scheduled for the third day and the remaining time is for the return run, over the same route, to Bombay.

Cook Outdone—Thirty days of touring in the south of France, touching such centers of population as Nice, Monte Carlo and Mentone, is a program arranged by the London Motor Omnibus Co. in one of its big Vanguard omnibuses. The route will be by Rouen, Orleans, Avignon, Orange, Marseilles and Hyeres, while such places as Grenoble, Dijon and Paris will be made on the return trip. A fare of $250, including traveling tickets, hotel accommodations, meals, motor excursions and the service of a competent conductor, is charged. Already all accommodation has been taken up and more are applying.

Paper Uses Tri-Cars—Delivering newspapers by tri-cars in the heart of old London can be considered one of the latest conquests of the gasoline motor. The Westminster Gazette, noted from time immemorial for its dispatch in delivery, has installed a fleet of four tri-cars for covering the heart of the city in distributing its papers. The tri-car, selected because of its light weight and good speed, is admirably adapted for work on crowded streets, as it is capable of threading through congested thoroughfares where its big brother, the motor car, would be stalled behind endless lines of wagons for blocks at a time. These little hustlers can pick their way with astonishing quickness. The papers occupy a conspicuous place between the two front wheels in a carrying box, the outsides of which are utilized in posting the leading features of the paper. The single cylinder motors are mounted between the driver's legs, motor cycle style, and drive to the single rear wheel through a roller chain.

Organized New Company—Ford Wharton, of Sharon, Pa., has formed a company to operate touring cars between Sharon and Mercer. A line will soon be in operation between Warren and Cortland, O., a few miles distant.

Model Bus—The Loveless Transfer Co., operating a motor bus line out of Warren, O., uses a Packard bus, which has a unique form of body construction, the chassis, however, being the same as used in the regular 1½-ton Packard trucks. A glance at the body lines reveals innovations in the compartment for the driver in front with its vestibuled appearance, glass front, side doors and accommodation for light baggage. The passengers-carrying part in the rear is unique in possessing a perfectly enclosed compartment reached by a side door rather than one in the end. In the rear is a drop platform, to which heavy trunks can be strapped. It would be difficult to design a vehicle better intended for use in inclement weather, the heavy box design and glass windows affording excellent protection, while not restricting the lighting arrangements. All of the operating devices are entirely enclosed and in point of comfort the bus can be looked upon as a good sample of the Pullman motor coach of the days to be.

New Truck Maker—The Commercial Motor Truck Co., of Toledo, O., with a capital stock of $20,000, has been organized by C. A. Kellar, J. E. Moran, H. M. Hoover, Gus Haas and Otto Kniegge. The company will manufacture gasoline motor trucks. The location for a plant has not been fully decided.

For Pleasure Seekers—George W. Boyce, of Syracuse, N. Y., president of the Lewis Point Land and Improvement Co., expects to start an automobile transportation line along the shores of Oneida lake, taking in Oneida, Lower South bay, Lewis point, Upper South bay, Canastota and other places. Lewis point is being developed as a summer resort and the promoters are planning to get all the transportation lines feeding into it as possible.

Wants Electric Vehicles—Commissioner Cantine, of Albany, N. Y., is starting a shaking up in the police and fire departments in the city, and advances as a part of his new scheme the introduction of electric patrol wagons to take the place of the horse-drawn wagons. He is also advocating the buying of a motor runabout for the exclusive use of the chief of the fire department to be used in case of fires and when on rounds of inspection.

Starts With Cartridge—The Wolseley Motor Car Co., of Birmingham, England, has dispatched to the General Electric Co., of Schenectady, N. Y., a six-cylinder vertical gasoline motor of 140 horsepower, designed to actuate the generator of an electric railway carriage. The novelty in the design is that the first three cylinders in sequence of impulse are furnished with cordite cartridge breech block. In these a charge is electrically exploded when the engine is to be started. They give the initial impulses which start the group and the usual cycle of operations succeeding the breech blocks are removed and sparking plugs substituted. In England when big gasoline engines have to be handled for stationary work, a small supplementary engine is filled for starting purposes, but the cordite cartridge is a simplification.

Model Packard Passenger Bus Used by the Loveless Transfer Co., of Warren, O.

CHAINS AND GEAR DRIVE

Hartford, Conn.—Editor MOTOR AGE—It might be stated that the Italian car which made by far the most wonderful exhibition in the Vanderbilt cup race, was equipped with double chain drive. This, however, probably proves nothing in favor of the chain transmission, as the skillful and fearless Lancia would undoubtedly have made a similar record with a gear-driven machine if the parts were in good proportion and backed up by a sufficient amount of power. Both the chain and bevel gear methods of transmission have given manufacturers and users a lot of trouble, but step by step the difficulties have been eliminated until both styles have made records of which we may well be proud.

I have been told that a certain American racing car which the makers wished to enter in the cup race was found before the eliminating trial to be considerably over weight, but they brought it to a point well under the stipulated weight by abandoning the gear drive and replacing it with the double chain. If this is true it would indicate that the double chain transmission gives greater strength with less weight, and this point should not be passed unnoticed. A number of years ago our automobile manufacturers equipped their steam cars with bicycle chains and then added extra seats for additional passengers without increasing the size of the chain. This gave the chain drive a black eye from the very start. Notwithstanding this fact, I believe about 80 per cent of the cars are chain-driven at the present date. The chain and sprockets used on practically all of the earlier model gasoline cars were not correct and suitable for the purpose, and most of the chains were damaged by interference, as but few manufacturers allowed sufficient space for chain clearance. When it was found that chains were not heavy enough for the severe duty, it was in most cases impossible to remedy the difficulty by supplying larger or heavier chains on account of the limited space provided. When the gear drive was presented it was welcomed by many who had been annoyed with chain troubles, but later on they were equally disgusted with bevel gear troubles and difficulties with universal joints, thrust collars, weak rear axles, limited power, and other things of like nature.

Certain manufacturers made their own sprockets and evidently assumed it was only necessary to mill in same the correct number of teeth. If the sprockets were not the right width, not cut to the correct bottom diameter, teeth too straight on the sides and irregularly spaced, sprockets out of line, etc., it was supposed to make but little difference. When some of the same manufacturers commenced to experiment with the gear drive they were obliged to purchase their gears from manufacturers who were expert in this line and it was necessary to pay a high price for the quality and accuracy required to insure the gears revolving. If bevel gears were cut in the manner some sprockets have been the result would be astonishing. I believe both the shaft and chain drive at present on many cars are a success, but imagine the chain will be by far more popular in the future for the following reasons: Less weight, less friction, lower cost to manufacture, lower cost to repair, less time to repair, ease of changing gear ratios to suit road conditions for various parts of the country, saving on tires by less weight, more reliable rear axles for rough roads and heavy loads, and in case of an accident the chain-driven car may be pushed off a railroad track or from the center of a road. One pound added to the axle is harder on both tire and axle than many pounds added above the springs.—W. E. C., Whitney Mfg. Co.

CRANKSHAFT MANUFACTURE

Hartford, Conn.—Editor Motor Age—The method of crankshaft manufacture in America has been to drop forge the shaft in two pieces, then electrically weld and machine. To drop forge it is necessary to heat billets to cherry red, and the only way to get the strength back into the metal—that which is lost in the heating—is to hammer the forging until the normal strength returns. In Europe this method is not used, and is the one point of great criticism directed at the way of constructing American cars. The European method, made possible by the cheap cost of labor, is to drill squares out of a solid block and machine the shaft cold by lathe and milling machine. It is a matter of American progress that at least one American builder has adopted this slow and costly construction for 1906 cars and is now making shafts in this slow and laborious fashion, the completion of a shaft requiring 3 weeks' time.—S. H.

TECHNICAL AUTOMOBILE MEN

Milwaukee, Wis.—Editor MOTOR AGE—I have made a little investigation of the higher education and higher schools, pertaining to automobile work, and am convinced that we are pretty well fixed in this line. The automobile manufacturers of the United States are about to show the world what has been done in this country. The race among the manufacturers of automobiles in the different countries is a trying one, and it now is their aim to put a staple article upon the market, and this at a moderate price. In order to do this, the work is put into experienced hands, but where is the theory which occupies so prominent a seat in all our sciences? Who are the superintendents of automobile factories of today? They are men who worked up from the bench in bicycle factories, self-made men and practical, it is true, but of theoretical knowledge they have little.

Why do we need higher schools? Have we not some of the best engineering colleges of the world? Why not make some use of the graduates? Should the manufacturer investigate, I am positive he would be surprised in most of these men. Some have followed the automobile from its infancy to its present state and have taken a critical view of it in its smallest detail. They are good mechanics and can handle men successfully, systematically and more economically than the self-made men; yet we stand pat on the self-made men, who have little knowledge of the construction and the theory of the motor car, the combustion motor, the steam engine, the electric motor and the subject of ignition.

Some say there is employment for technical automobile men, and that there always will be—as they are imperative to the construction of motor cars—especially more so now than in the past; yet the manufacturer does not make use of them. Why not? Because he cannot get the technical graduate for the same amount of money that he can get the self-made man. Here his payroll is smaller and there he spends it tenfold in a roundabout way. The technical man does not wish to be put on a level with the ordinary laborer. Why did he spend his time and money on theory—to satisfy his own desires or to be of benefit to mankind?

In my travels throughout the United States the past summer I came in contact with a number of these technical men—men well experienced in all the phases of automobile work—who are at present following work in an altogether different field, because they are not valued as high as they ought to be. First make use of what there is, and, when this lot is exhausted, there still remains time for higher schools.—N. BINGENHEIMER.
